CRUSADER ART IN THE HOLY LAND, FROM THE THIRD CRUSADE TO THE FALL OF ACRE, 1187–1291

In this monumental work, Jaroslav Folda examines the art and architecture produced for the Crusaders during the century that Acre served as the capital of the Latin Kingdom of Jerusalem, from 1191 to 1291. Commissioned by Crusaders, pilgrims, merchants, and resident Franks in the Crusader territories of Syria-Palestine, these artworks were produced by Westerners who had traveled to the Latin East, resident Franks, Eastern Christians, and even Muslims who worked for Crusader patrons. Defining "Crusader art" as one that meshes the traditions of the Latin West and the Greek and Islamic East, Folda identifies the surviving works, discusses the main artistic developments in historical context, and shows how thirteenth-century Crusader art differs from that produced in the twelfth century. Although important achievements were made in religious book painting and coinage, the most dramatic innovations are found in icon painting and secular manuscript illustration. The result of years of research, *Crusader Art in the Holy Land* synthesizes the scholarship on a significant chapter in the history of medieval art. Lavishly illustrated with more than four hundred illustrations, this volume also includes a CD-ROM with a complete set of more than 500 illustrations from Crusader manuscripts.

Jaroslav Folda is N. Ferebee Taylor Professor of the History of Art at the University of North Carolina, Chapel Hill. A scholar of medieval art, he is the author of numerous articles and books, including *The Art of the Crusaders in the Holy Land, 1098–1197*, which received the Charles Homer Haskins Medal from the Medieval Academy of America in 1999.

NOTE ON THE SCHOLARLY APPARATUS OF THIS BOOK

The expanded Table of Contents which follows is designed to facilitate the reader's access to the discussion of the historical context and the artistic developments in each of major chronological sections of this study.

Access to the Maps is provided in the List of Maps with a Note on the Maps.

Access to the works of art and architecture reproduced in the book is provided by the List of Color Plates, List of Figures, and List of Illustrations on the Compact Disc. The List of Figures is self-explanatory with a page number accompanying each item where the reproduction can be found. There are two special categories for the reproductions:

1. For the reproductions of the Icons please note that in addition to the individual icon entries found in the List of Figures [1–352] for the main text, there is also a complete list of icon reproductions contained in the List of Figures for the Appendix [Icons no. 1–134] immediately following. This means that for each icon cited in the Appendix reference is given to pages in the main text and in the Appendix where reproductions of the icons can be found. Figures 353–415 are located in the Appendix itself.

2. For the reproductions of the Illustrated Manuscripts please note that in addition to the individual entries found in the List of Figures [1–352] for the main text, a CD is provided at the back of the book which contains the full documentary reproduction [501 figures] of all the clearly identified Crusader manuscripts discussed in this study. These figures are listed in the List of Illustrations on the Compact Disc.

Abbreviations used are found on pp. lix ff., including special sections on abbreviations for studies on icons by K. Weitzmann, on p. *lxi*, and abbreviations for studies on icons by other scholars, on p. *lxii*.

A full set of end notes follows the Appendix at the end of the text.

A full Bibliography divided into six sections follows the Notes.

There is an Index of Manuscripts following the Bibliography.

LIST OF COLOR PLATES, MAPS, AND FIGURES

INTRODUCTION

The black-and-white illustrations included in this volume are intended to provide the visual documentation required for the task of identifying and presenting the corpus of works of art said to have been done for Crusader patrons, or by Crusader artists in mainland Syria-Palestine. Although my intent is to be as comprehensive as possible, the reality of the photographic documentation varies by medium. Whereas I have perforce had to be selective with regard to works of architecture, sculpture, seals, pottery, and glass, in other media such as coins, manuscript illumination, and icon painting, the visual record is much more complete. In principle it has been possible to represent an example of every major coin type associated with the Crusader States in Syria-Palestine, although of course for most coins there are many extant examples of each type. For the illustrated manuscripts all major examples of figural decoration have been included in the documentary reproductions available on the compact disc that accompanies this volume, a total of 501 illustrations. Likewise, a photograph of every icon thought to be associated with Crusader patrons or Crusader artists has been included here, most in the text but many in the handlist of icons that appears as the Appendix. Overall there are 134 icons associated with the Crusaders in one way or other. Along with the black-and-white photographic reproductions, eleven color plates are included, comments about which follow.

COLOR PLATES

Introduction

For this volume on the thirteenth-century art of the Crusaders in the Holy Land, the focus is on figural illustration found in manuscript illumination and icon painting. It will become evident from examining these plates that the colorism of the art of the Crusaders in the thirteenth century is substantially different from the colorism of twelfth-century Crusader art, examples of which were presented in *The Art of the Crusaders in the Holy Land: 1098–1187*. Some of these changes can be characterized as follows:

The intense Byzantine-influenced colorism of the twelfth-century work continues in many works of painting, but the hues, shading, and highlighting all change. Part of this is observed as the developments derived from the basic changes in Byzantine, Italian, French, English, German, and Eastern Christian art from the twelfth to the thirteenth century. Part of it, however, is the result of a new synthesis of the Byzantine and other Eastern Christian traditions with artists who are now Crusader in origin. This means these artists are mostly resident Franks born in the Holy Land and trained in the Near East. These artists may still have strong links with French or Italian painting, based on the training they received in Acre or other centers, based on their ancestry, and based on how long their family may have lived in the Crusader States or how recently they may have arrived. It is striking to find evidence of one painter, the Paris–Acre Master, who arrived fully trained in a good high Gothic style from Paris from the 1270s. It is remarkable to see his French Gothic colorism contrasted with works by others artists who worked in a Franco-Byzantine Crusader style, a Veneto-Byzantine Crusader style, a Tuscano-Byzantine Crusader style, or other variants of the distinctive Eastern Crusader style, which blended Byzantine, East Christian, French, Venetian, Tuscan, south Italian, German, or English elements together with local Levantine aspects observed from daily life in the East.

Manuscript illumination and icons are the primary media that retain their original colorism from the thirteenth century, but pottery and especially glass also provide striking examples. In any case, the purpose of the examples in this color section is to provide the reader with important samples by which to observe the striking and in some cases exotic colorism of Crusader work. No less than the twelfth-century work, Crusader work in the thirteenth century has coloristic characteristics that distinguish it from works done elsewhere in the medieval world. The colorism was intense, partly as an expression of the brilliant sun and vivid quality of the light, especially along the eastern Mediterranean littoral where most of these works were done. The strength of the sun, the vivid quality of the light, and the overall intensity of the visual environment must have all been important factors in the coloristic range that characterized the art of the Crusaders during the period from 1187 to 1291.

Color plates begin on page lxix.

1 Christ in Majesty, "Crusader" Icon now at Sinai: App. no. 34/308 (Fig. 51).
2 Annunciation and Nativity with prophets, historiated initial, "B," Psalter, Florence, Bibl. Riccardiana, MS 323, fol. 14v (Fig. 120).
3 King Solomon with Holy Wisdom, panel miniature, Bible, Paris, Bibl. de l'Arsenal, MS 5211, fol. 307r.
4 Virgin and Child Enthroned with Angels, central panel of Acre Triptych, "Crusader" Icon now at Sinai: App. no. 66/753 (Fig. 156).
5 Saints Theodore and Demetrios, "Crusader" Icon now at Sinai: App. no. 40/386 (Fig. 184).

6 Pelias and Jason, and the Sailing of the Argo, panel miniatures, *Histoire Universelle*, Dijon, Bibl. Municipale, MS 562, fol. 89v (Fig. 204).
7 Acre: golden *Agnus Dei* bezant (Figs. 163 and 215).
8 Queen Penthesilea leads her army to aid the Trojans, panel miniature, *Histoire Universelle*, London, British Library, MS Add. 15268, fol. 122r.
9 The Crusaders attack Antioch, panel miniature, William of Tyre, *History of Outremer*, Paris, Bibl. Nationale, MS fr. 9084, fol. 53r (Fig. 249).
10 The Byzantine emperor John attacks the city of Shayzar while the prince of Antioch and the count of Edessa stay in camp, panel miniature, William of Tyre, *History of Outremer*, Paris, Bibl. Nationale, MS fr. 9084, fol. 182v (Fig. 250).
11 The Virgin and Child Hodegetria, "Crusader" Icon from Sinai: App. no. 22/200 (Fig. 289).

NOTE ON THE MAPS

The concept of linear boundaries in the medieval world was largely invented in the nineteenth century. The linear boundaries indicated in the maps listed should probably best be thought of as approximations of the territory controlled by the Crusaders at the times cited, but the reality of what was controlled was complex and constantly changing. We should realize we cannot project our notions of linear boundaries back onto the medieval world as Ronnie Ellenblum has pointed out: idem, "Were There Borders and Borderlines in the Middle Ages? The Example of the Latin Kingdom of Jerusalem," pp. 105–19 in D. Abulafia and N. Berend (eds.), *Medieval Frontiers: Concepts and Practices*, Aldershot and Burlington: Ashgate, 2002.

BLACK-AND-WHITE REPRODUCTIONS

Figures

Reproductions are listed sequentially according to the chapter in which they appear, with the exception of the manuscripts and some of the icons. For the manuscript illuminations, in principle a sample reproduction from each codex is provided in the text, often more than one for the most important manuscript examples. The full set of major figural decorations for each manuscript is, however, fully documented on the compact disc included with this volume, at the back of the book.

The plates for the icons discussed in the text are found in the regular sequence of figures and appear in principle where the icon is first fully discussed in the text. Icons not discussed in the text that belong to the "Western-influenced" or "Crusader" group in the collection at the Monastery of St. Catherine on Mount Sinai are illustrated in the handlist in the Appendix. There are a few additional icons not in the St. Catherine's collection cited at the end of the Sinai handlist, nos. 125–34. Their illustrations are treated in the same manner, illustrated in the text when first discussed; those not discussed and therefore not illustrated in the text are illustrated in the handlist.

Credits for the photographs are given with the captions. Photos are by the author if not otherwise indicated. Icons are given a figure number and an appendix number. For icons now at Sinai, the appendix number combines its handlist number with its inventory number in the Sinai Archive at the University of Michigan (e.g., App. no. 34/308). The inventory number is the icon's unique numerical label for the purpose of this study, and it is used by permission of the Sinai Archive.

LIST OF FIGURES

Chapter 2

1 Latin Kingdom, anonymous, "*Turris Davit*" denier: a and b. ◆ 30
2 Margat Castle: (a) view from the west; (b) main chapel, general view. ◆ 31
3 Margat Castle, plan of the chapel in the southwest sector of the castle (after Müller-Wiener): no. 5. ◆ 31
4 Margat Castle, chapel interior, view looking east. ◆ 32
5 Margat Castle, northeast room, view looking west. ◆ 33
6 Margat Castle, northeast room, view of vault, two apostles (nos. 5 and 6) on south side of vault. ◆ 33
7 Margat Castle, northeast room, view of vault, apostles 1 and 2 on south side of vault. ◆ 33
8 Margat Castle, northeast room, view of vault, apostles 7, 8, 9, and 10 on north side of vault. ◆ 33
9 Margat Castle, chapel interior, apse wall (outside northeast room), north side with fragmentary remains of fresco underdrawing in geometric patterns. ◆ 34

Crusader Coins (1187–1192)

10 Latin Kingdom, Amalricus denier, immobilized type: (a) denier; (b) obol. ◆ 46
11 Cyprus, copper coin with portrait of Guy de Lusignan. ◆ 46
12 Acre, copper pougeoise of Henry de Champagne, fleur-de-lis on reverse. ◆ 46
13 Acre, copper pougeoise of Henry de Champagne, hexagram on reverse. ◆ 47
14 Acre, billon "*Moneta Regis*" denier. ◆ 47
15 Acre, gold bezant, 80 percent fineness. ◆ 49
16 Acre, gold bezant, 68 percent fineness. ◆ 49
17 Tripoli, Bohemond star billon denier. ◆ 49
18 Tripoli, anonymous copper coin with fortified gate: a and b. ◆ 50
19 Tripoli, anonymous copper coin with star and crescent. ◆ 50
20 Tripoli, gold bezant, 62 percent fineness. ◆ 50
21 Antioch, helmet denier of Bohemond IV or Bohemond V. ◆ 51

Chapter 3

22 Crac des Chevaliers: general view from the east side. ◆ 76
23 Crac des Chevaliers: main entrance to the castle. ◆ 77
24 Crac des Chevaliers: view of the castle from the north. ◆ 77

25 Crac des Chevaliers: view of the inner castle from the south. ◆ 78
26 Crac des Chevaliers: view of the rectangular tower at the northwest corner. ◆ 78
27 Crac des Chevaliers: view of the outer defensive walls on west side. ◆ 79
28 Crac des Chevaliers: exterior view from the west. ◆ 79
29 Tartus/Tortosa, Cathedral of Notre Dame: view from the west. ◆ 80
30 Tartus/Tortosa, Cathedral of Notre Dame: interior view of the nave. ◆ 81
31 Tartus/Tortosa, Cathedral of Notre Dame: view of special pier with shrine to the Virgin Mary. ◆ 81
32 Tartus/Tortosa, Cathedral of Notre Dame: view of the roof on the north side. ◆ 82
33 Tartus/Tortosa, Cathedral of Notre Dame: groin vaulting in the south aisle. ◆ 82
34 Tartus/Tortosa, Cathedral of Notre Dame: foliate capitals. ◆ 82
35 Tartus/Tortosa, Cathedral of Notre Dame: exterior view from the south with buttresses and the flat roof line. ◆ 83
36 Acre, silver *Dragma Acconensis*. ◆ 84
37 Acre, billon denier, *Amalricus Rex*, immobilized type. ◆ 84
38 Acre, cut gold fragments. ◆ 84
39 Beirut, billon denier of John of Ibelin: a and b. ◆ 85
40 Sidon, billon denier of Renaud Grenier. ◆ 85
41 Sidon, billon denier of Balian Grenier. ◆ 85
42 Antioch, billon helmet denier. ◆ 86
43 The Resafa Silver Treasure: view of the various pieces in the silver treasure. ◆ 88
44 The Wappenpokal: (a) exterior; (b) interior. ◆ 89
45 The chalice. ◆ 90
46 The chalice foot. ◆ 90
47 The paten. ◆ 91
48 The censer. ◆ 91
49 The Naples Missal, Bibl. Nazionale, MS VI G 11, fol. 96v, Crucifixion (full-page miniature). ◆ 93
50 The Naples Missal, fol. 97r, *Maiestas Domini* (full-page miniature). ◆ 94
51 Icon: Sinai, App. no. 34/308, Maestas Domini. ◆ 95
52 Icon: Sinai, App. no. 76/1024, Christ Enthroned. ◆ 96
53 Crac des Chevaliers: presentation of Christ in the Temple from the exterior north wall of the chapel, now in the Tartus Museum (= Cathedral of Notre Dame, Tortosa). ◆ 97
54 Crac des Chevaliers: external chapel, Virgin *Hodegetria* with angel at the upper right, on an armature after removal from the chapel wall. ◆ 98
55 Crac des Chevaliers: external chapel, St. Pantaleon. (a) in situ before removal from the chapel wall; (b) on an armature after removal from the chapel wall. ◆ 99
56 Crac des Chevaliers: external chapel, St. George and the youth of Mitylene (fragment of the horse, in situ before removal from the chapel wall). ◆ 99
57 Crac des Chevaliers: external chapel, seated figure, in situ before removal from the chapel wall. ◆ 99
58 Stadt Freiburg im Breisgau Kulturamt: Augustinermuseum, inv. no. G. 23: "The Freiburg Leaf": Christ and Zacchaeus, Sts. George and Theodore, fol. 1c, r. ◆ 100

Chapter 4

59 Damietta, billon denier, *Damiata*, coined by John of Brienne. ◆ 115
60 Damietta, billon denier, *Damieta*, coined by John of Brienne. ◆ 115
61 Acre, aerial photo (1994), courtesy of B. Z. Kedar. ◆ 125
62 'Atlit, aerial photo (1947), courtesy of the Palestine Exploration Fund. ◆ 126
63 'Atlit, aerial photo, courtesy of B. Z. Kedar and the Gustaf-Dalman-Institut, Greifswald. ◆ 126
64 'Atlit, Chastel Pelerin, plan of castle and town. ◆ 127
65 'Atlit, Chastel Pelerin, plan of castle. ◆ 128
66 'Atlit, Chastel Pelerin, North Tower with carved corbels. (a) View of wall; (b) left corbel; (c) central corbel; (d) right corbel. ◆ 129
67 'Atlit, Chastel Pelerin. (a) Plan of polygonal church (after R. D. Pringle) and (b) view of fragmentary remains in 1975. ◆ 130
68 'Atlit, drawings of carved gravestones. ◆ 131
69 'Atlit, Chastel Pelerin, view of the west undercroft. ◆ 131
70 'Atlit, pottery: Proto-maiolica ware and seal of Simon de Guinecort, excavated at 'Atlit. ◆ 133
71 Caesarea: (a) plan of the city and (b) plan of St. Peter's Cathedral. ◆ 135

LIST OF ILLUSTRATIONS ON THE COMPACT DISC

CRUSADER MANUSCRIPT ILLUMINATION AND ILLUMINATORS IN THE THIRTEENTH CENTURY IN THE HOLY LAND

This compact disc contains documentary photos of all twenty-seven known manuscripts decorated by Crusader book painters in the thirteenth century or painted or drawn in the Crusader East. The photos include all major figural images and a selection of nonfigural decoration and decorated text pages, some with musical notation, attributed to the Crusader States in Syria-Palestine. There are also illustrations from three manuscripts done in Paris by the Paris–Acre Master before he went to Acre.

The manuscript illustrations are organized in more or less chronological order, according to the way they are presented in the text of this book. For each codex, the images are presented in the sequence in which they appear in the manuscript.

LIST OF MANUSCRIPTS

1–8, Naples, Biblioteca Nazionale MS VI G 11: The Naples Missal, from Acre.
9–14, Stadt Freiburg im Breisgau Kulturamt: Augustinermuseum, inv. no. G. 23:

PREFACE

COMMENTS ON THE PROCESS OF RESEARCHING AND WRITING THIS BOOK, WITH ACKNOWLEDGMENTS

This book forms part of a historical study on the nature and development of Crusader art in the immediate context of the Holy Land on the mainland of Syria-Palestine and in the broader setting of Europe and the Mediterranean world between 1098 and 1291. In the first volume of this study I dealt with the art of the Crusaders between 1098 and 1187. In this volume I have attempted to tell the story of Crusader artistic developments in the turbulent years between the time of the battle of Hattin and the loss of Jerusalem to Saladin in 1187 up to the Mamluk conquest of the Latin Kingdom of Jerusalem in 1291.

Because the research for this project goes back to my first visit to the Near East in 1973, there are many persons and many institutions to which I am indebted for assistance, too many to thank specifically or adequately here. I have tried to mention all of them at various points along the way, either in publications produced in the earlier stages of this project or in this volume itself. For everyone who is named I want to express my thanks for their generous aid and support. For others who assisted me but who may not be named, I want to thank them as well and ask their indulgence and patience with a scholar whose intentions were correct but whose execution may be less than perfect.

I started writing this book in the fall of 1998 while appointed as the Allen W. Clowes Fellow at the National Humanities Center in Research Triangle Park, North Carolina. For the academic year 1998–9, the National Endowment for the Humanities had also awarded me a fellowship for university teachers, and this was supplemented by a research leave from the University of North Carolina. Taken together this support enabled me to work intensively on my research and writing for a total of fifteen months, from May of 1998 to August of 1999. The conceptualization of the overall agenda and the development of the main lines of argument of this book, along with the difficult first weeks of getting started with the writing, thus began in the congenial and stimulating setting of the National Humanities Center. The long, exciting process of formulating and evaluating what we know of Crusader art between 1187 and 1291 then followed, and Part One of the book, constituting the discussion of the period 1187–1244, was completed in these auspicious circumstances.

I can state categorically that the early chapters, 1–5, that cover this period were unusually challenging because of the turmoil in the Latin East and the relative scarcity of extant Crusader art identifiable to these years. Furthermore, the fact that whereas between 1095 and 1187 – a period of ninety-two years – there were only two Crusades, but between 1187 and 1244 – a period of fifty-seven years – there were eight Crusades, means that the historical discussion is more complex and encumbered with a much larger and more diverse bibliographical apparatus. I would not have been able to deal with this difficult period as seriously, as efficiently, or as expeditiously had it not been for the exceptional support of the Library Service at the National Humanities Center. I would like to take this opportunity to extend my deep gratitude to Alan Tuttle, Jean Houston, and Eliza Robertson for their wonderful work, day in and day out. Without their help, this book would not be finished now, and it might never have been finished.

Chapter 6, dealing with the years 1244 to 1268, occupies a pivotal position in this book. It is during this period that Hohenstaufen claims to the crown of Jerusalem finally ended, that the power of feudal lords in the Latin Kingdom dominated over royal rule, that mercantile hegemony shifted from Genoa and Pisa to Venice in the Crusader East, that the Ayyubid dynasty succumbed to Mamluk rule in Cairo, and, of course, that Louis IX came on Crusade to the Near East. These developments have a profound impact on the art of the Crusaders, which blossomed under French and Italian stimulus.

For the writing of the art historical section of Chapter 6, I was privileged to be appointed to the Institute for the Arts and Humanities at the University of North Carolina in the spring semester of 2001. In the stimulating circumstances of this faculty seminar, I was able to investigate and complete my interpretation of the crucial artistic developments in the Latin Kingdom associated with the patronage of King Louis IX and executed in the aftermath of his nearly four-year visit.

I thank the institute and its director, Ruel W. Tyson, for making this fruitful semester's work possible. I would also like to thank the various librarians at the University of North Carolina for their help and support in dealing with this project during the summer of 2000 and the spring of 2001. I thank especially Pat Thompson, librarian of the Sloane Art Library, and her able assistant, Rachel Frew. There is also the outstanding Humanities Reference Staff in the Walter Royal Davis Library of the University of North Carolina, including the interlibrary loan librarians, who helped me with the consultation of numerous works not held in libraries in the Research Triangle of North Carolina.

The last three chapters of this book – Chapter 7, dealing with the years 1268 to 1289; Chapter 8, covering the years 1289–91; and the concluding Chapter 9 – were effectively written in the auspicious circumstances of the Center for Advanced Study in the Visual Arts (CASVA) at the National Gallery of Art in Washington, D.C. I am grateful for the appointment as an Ailsa Mellon Bruce Senior Research Fellow during the spring semester of 2002, which gave me the opportunity to complete my study in a timely manner. The library, staff, and Fellows of the center were very helpful to me in various ways, and I thank especially the dean of the center, Elizabeth Cropper, for welcoming me to CASVA, and my colleagues M. Shreve Simpson, Margherita Azzi, and Lamia Doumato for helpful suggestions drawn from their areas of expertise as I worked. I was also fortunate to have had my office on the friendly confines of the third floor in the East Building where my friend and colleague Andrew Robison, curator of prints and drawings, has his curatorial offices. Finally, there at CASVA my research needs also depended heavily on the services of the Library of the National Gallery of Art and the interlibrary loan services. I would like to express my warm gratitude to the reference librarian, Lamia Doumato, for her help and interest in my project, and to Thomas McGill, Jr., and his able staff of interlibrary loan librarians for cheerfully and efficiently helping me to find the books at the Library of Congress and elsewhere that I needed to press on with my work. In those cases when my requirements could not be met in normal circumstances, I resorted to the library at the Dumbarton Oaks Center for Byzantine Studies. I would like to thank the director of Byzantine studies there, Alice-Mary Talbot, and the Byzantine librarian, Irene Vasleff, for their valuable help and support whenever needed. Finally my thanks to Fr. Seamus Finn for the hospitality of the OMI House during my six months in Washington, D.C.

I hope that the National Humanities Center, the National Endowment for the Humanities, the Institute for the Arts and Humanities of the University of North Carolina, the Center for Advanced Study of the Visual Arts, and the University of North Carolina, along with other agencies that support research in the humanities and that have assisted me over the years, will find their generosity to me at least partly rewarded by the publication of this book. I am truly grateful to these institutions for their confidence in my work and their willingness to invest their financial resources in this large, long-term project that has now stretched over thirty years since my first visit to the Holy Land in 1973.

Needless to say, I have benefited from the intellect, talents, and assistance of a large number of colleagues in diverse fields. Among those whom I can thank here for substantial help at some point in this large project that has taken me nearly five years to write, I express my gratitude to the many colleagues in the fields of archaeology, art history, history, medieval studies, numismatics, and other fields who have helped me with my work on this study. The footnotes indicate who many of these scholars are, but I also want to mention certain colleagues with whom I have had especially fruitful interchanges over the years: François Avril, Malcolm Barber, Martin Biddle, Paul Binski, T. S. R. Boase (†), Elizabeth Bolman, Alan Borg, Caroline Bruzelius, Hugo Buchthal (†), Annemarie Weyl Carr, Carolyn Connor, Giles Constable, Rebecca Corrie, Anthony Cutler, Anne Derbes, Erica Dodd, Peter Edbury, Helen Evans, Ilene Forsyth, George Galavaris (†), David Ganz, Sharon Gerstel, Dorothy Glass, Philip Grierson, Bernard Hamilton, Harry Hazard (†), Angela Hero, Norman Housley, Lucy-Anne Hunt, R. B. C. Huygens, Benjamin Kedar, Nurith Kenaan-Kedar, Herbert Kessler, Bianca Kühnel, Gustav Kühnel, David Jacoby, Hans E. Mayer, Michael Metcalf, Doula Mouriki (†), Robert Nelson, Robert Ousterhout, Valentino Pace, Richard Pfaff, Michele Piccirillo, John Porteous, Joshua Prawer (†), Denys Pringle, Susan Rankin, Scott Redford, Jean Richard, Jonathan Riley-Smith, Nancy Ševčenko, Alison Stones, Lee Striker, Kurt Weitzmann (†), John Wilkinson, Joseph Wittig, and Barbara Zeitler.

Of the scholars presented in this list, I would like to single out three for special mention as being instrumental in making it possible for me to do this study. The first is Kurt Weitzmann, who, as my undergraduate teacher, first inspired me to enter the field of medieval art history. It was Professor Weitzmann who did such pioneering work on the study of Byzantine icons and laid the foundations for scholarly research of the icons associated with the Crusaders now in the collection of the Monastery of St. Catherine at Mount Sinai. It was his work along with that of George Forsyth as part of the Michigan-Princeton-Alexandria expeditions to Mount Sinai in the 1950s and 1960s that resulted in the establishment of the Sinai Photographic Archive at the University of Michigan.

Although Professor Weitzmann was unfailingly generous in sharing his knowledge of the icons and in allowing me to consult the photographs in his office at Princeton for my research, he died before I began the phase of my project in which thirteenth-century icons play such a major part. At his death Professor George Galavaris, one of Kurt Weitzmann's most outstanding former graduate students, stepped forward to assume the mantle of his mentor. It was Professor Galavaris, then at the University of Montreal, who assumed responsibility for the Sinai icon research project founded by Weitzmann. It was my great good fortune that Professor Galavaris kindly continued Kurt Weitzmann's scholarly generosity toward me. This was manifested in his willingness to write to Archbishop Damianos at St. Catherine's Monastery on my behalf, leading to my second visit there, and, in a letter dated 14 February 1997, he granted me the opportunity to assemble a full working collection of photographs of the Western-influenced icons in the collection at the Monastery of St. Catherine from the Sinai Archive at the University of Michigan, curated by Gertraud Reynolds.

Finally, Hugo Buchthal also deserves special mention as well because of his crucial role in introducing me into the world of Crusader manuscript illumination. Not only did he encourage me to pursue my doctoral research on the illustrated manuscripts of William of Tyre's *History of Outremer*, a subject in which he, of course, had broken the first ground, but he also personally supervised the writing of my dissertation, standing in as an act of generous friendship for my major professor at the Johns Hopkins University, Dr. Adolf Katzenellenbogen, who had died suddenly in the fall of 1964. The lessons I learned about researching medieval manuscripts as the result of his mentoring have substantially undergirded my work over the years. In conclusion, I can say forthrightly that this volume, which brings icon painting and manuscript illumination together in various ways, owes a huge debt to all three of these scholars.

Among the excellent graduate students I have worked with over the years, I should like to thank the following persons for their stimulating seminar presentations that pertained to thirteenth-century art in the medieval Mediterranean world: Shannon Cottin-Bizonne, Molly Cronenwett, Ann Driscoll, Mary Fournier, Irene Gates, Jennifer Germann, Evan Gatti, Elizabeth Howie, Elizabeth Hudson, Kimberly Judge, Art McClendon, Gloria Park, Kirstin Ringelberg, Jessica Sponsler, Camille Tewell, Pamela Whedon, Elle Winsor, and Lila Yawn. I would also like to thank my research assistant, Allison Fox, who was cheerfully and unfailingly helpful during the final months of preparing this study for production in the fall of 2003.

My research on Crusader material has been facilitated by many people in many institutions at many places. I thank the following institutions for assistance and access to their collections: the American Schools of Oriental Research with centers in Jerusalem, Amman, and Nicosia; the American University in Beirut; the Archive Nationale in Paris; the Ashmolean Museum in Oxford; the Biblioteca Apostolica Vaticana in Vatican City; the Biblioteca Capitolare in Perugia; the Biblioteca Capitolare in Padua; the Biblioteca Laurenziana in Florence; the Biblioteca Marciana in Venice; the Biblioteca Nazionale in Naples; the Biblioteca Riccardiana in Florence; the Bibliothèque d'Art et d'Archéologie (Fondation Doucet) in Paris; the Bibliothèque de l'Arsenal in Paris; the Bibliothèque Municipale in Boulogne-sur-Mer; the Bibliothèque Municipale in Clermont-Ferrand; the Bibliothèque Municipale in Dijon; the Bibliothèque Municipale in Lyon; the Bibliothèque Nationale in Paris; the Bibliothèque Royale in Brussels; the Bodleian Library in Oxford; the British Library in London; the British Museum in London; the British School of Archaeology in Jerusalem; the Byzantine Library of the Collège de France in Paris; the Institut de Recherche et d'Histoire des Textes in Paris; the Jewish Museum and the Rockefeller Museum of the Israel Antiquities Authority in Jerusalem; the J. Pierpont Morgan Library in New York; the Library and Collections of the Fitzwilliam Museum in Cambridge; the Library of Congress in Washington, D.C.; the Library of the Dumbarton Oaks Center for Byzantine Studies in Washington, D.C.; the Library of the Ecole Biblique in Jerusalem; the Library of Gonville and Caius College in Cambridge; the Library of the Greek Patriarchate in Jerusalem; the Library of the Hebrew University in Jerusalem; the Library of the Institut Catholique in Paris; the Johns Hopkins University Department of Art History Photograph Archive; the Library of the Musée Condé at Chantilly; the Library of the National Gallery of Art and the Center for Advanced Study in the Visual Arts in Washington, D.C.; the Library and Collections of the Walters Art Museum in Baltimore; the Library and Photo Archive of the Warburg Institute in London; the National Library of Russia (formerly the M. E. Saltykov-Shchedrin State Public Library) in St. Petersburg; the Monastery of St. Catherine at Mount Sinai; the Musée des Monuments Français in Paris; the Musée du Louvre in Paris; the National Museum in Damascus; the Parker Library at Corpus Christi College in Cambridge; the Rockefeller Library of Princeton University in Princeton; the Semitic Museum of Harvard University in Cambridge, Mass.; the Sinai Archive at the University of Michigan; the Studium Biblicum Franciscanum in Jerusalem; the Victoria and Albert Museum in London; and the Walter Royal Davis, Louis Round Wilson, and Joseph C. Sloane Libraries of the University of North Carolina in Chapel Hill.

Among these institutions, I acknowledge with special gratitude the generous hospitality of the abbot, Damianos, archbishop of Sinai and Raitho, and the fathers of the Monastery of St. Catherine at Mount Sinai, in particular Father Daniel and Father Justin, who assisted me during my most recent research trip to Sinai. These holy men face a tremendous challenge in that they follow the centuries-old and rigorous spiritual life of the monk but still find ways to make it possible for pilgrims and travelers to visit their monastery and for scholars to work on their incomparable artistic treasures. I thank Archbishop Damianos and the fathers of the monastery for facilitating my research on the icons in their collection and for their permission to publish the "Western-influenced" icons so crucial for this study.

The photographic documentation is one of the essential elements of this book, and I am especially indebted to those persons and institutions mentioned earlier for helping me to assemble the needed materials. My thanks are especially due to Gertraud Reynolds, curator of the Michigan-Princeton-Alexandria "Sinai Archive" at the University of Michigan in Ann Arbor, who has unfailingly responded to my many requests for photographs of Sinai icons. I am also extremely grateful to the University of Michigan for its courtesy to scholars in waiving fees for permission to publish photographs in its archive.

Another important aspect of the photographic documentation of this study is the compact disk that accompanies this book and contains illustrations of all extant decorated manuscripts known to be Crusader. For the production of this CD I thank the director, Douglas Mokaren, and his able staff in "Medical Illustration," which is the Photographic Laboratory of the University of North Carolina in Chapel Hill. I particularly want to thank Doug Mokaren for the preparation of the documentary CD; I owe its ease of access and all of its "user-friendly" features to his excellent design and execution.

For assistance with other photograph documentation and certain illustrations of this book, additional thanks are due. I thank especially Jennifer Bauer, head of visual resources in the Department of Art at the University of North Carolina, for her assistance, and Kimberly Judge, who worked carefully on the production of a large number of photos on my behalf. Finally, I want to express my gratitude to Patricia Neumann for her excellent work on the maps in this book at her Geo-Graphics studio in Manhattan Beach, California.

The text of this book has benefited from a critical reading by several of my colleagues. I especially thank Annemarie Weyl Carr, Anne Derbes, and Jonathan Riley-Smith for reading the entire text and making copious comments and suggestions, the implementation of which has greatly improved the end result. Jonathan Riley-Smith in particular critiqued the text in great detail and urged me to compress the historical introductions as much as possible. I have truly attempted to follow that advice, but mindful of what I perceive to be the needs of art historians reading this book, no doubt what remains will be somewhat more than he hoped for. I express my thanks also to Dorothy

Glass for reading Chapter 4 and to Daniel Weiss for reading Chapter 6. These scholars have all assisted me enormously in my efforts to write clearly, directly, and effectively – making my points clearly, presenting the state of the question directly, and arguing my interpretations effectively. For substantial help with compiling the bibliography at the end of this study, which pertains to this volume only, I am grateful for the able and efficient work of Dr. Lilla Kopar. For the valuable index of manuscripts, I am once again indebted to Roberta Englemann for her meticulous and excellent work in the XML format. Let me state enthusiastically how much I appreciate the contributions that all of these colleagues have made to the successful completion of this study, and let me also state clearly that any remaining errors or blemishes are, of course, my responsibility alone.

Cambridge University Press and my excellent editor, Dr. Beatrice Rehl, did an outstanding job in publishing the first volume of this study, so I was enormously pleased when they accepted this second volume as well. I want to thank Beatrice Rehl warmly for her able and enthusiastic leadership in guiding this work through the long process to final publication. Alan Gold is to be thanked for his excellent work on the design of this book. Michie Shaw, my production manager at TechBooks, deserves my warm thanks for her prompt and efficient work.

Finally, let me say that a publication like this is complex and expensive. I would like to express my gratitude to Cambridge University Press and the following agencies for financial support and special subventions enabling me to publish this book in a handsome and practical format with full documentary illustrations.

For a generous subvention, I thank the College Art Association for a Millard Meiss grant to Cambridge University Press to support the program of reproductions for this project. For a special subvention to support the publication of a selection of color plates, I thank the Samuel H. Kress Foundation.

For subvention grants that were both timely and invaluable, I thank the University Research Council of the University of North Carolina for approving funding for this publication project.

For substantial support during the past two years, I thank the Johnston Foundation of the College of Arts and Sciences at the University of North Carolina for major assistance with the costs associated with the acquisition of photos, for the production of the CD that accompanies this book, and for the fees for permissions to publish these photos in this book.

I dedicate this book to my family: to my wonderful wife, Linda, without whom there would be no book, and to the children and grandchildren with whom the future of our family belongs: Lisa Kristin; Natasha Katherine and her husband, Dr. Farrell O'Gorman; and my grandchildren, Anna Clare and Jaroslav Connelly.

INTRODUCTION

APPROACHING THE QUESTION OF THE ART OF THE CRUSADERS BETWEEN 1187 AND 1291

Iam non licet ambigere quod ad impar opus inprudenter enitimur et quod ad rerum dignitatem nostra non satis accedit oratio. Non nichil est tamen quod egimus. Nam et in picturis rudes et ad artis archana nondum admissi luteos primum solent colores substernere et prima liniamenta designare, quibus manus prudentior fucis nobilioribus decorem consuevit addere consummatum: prima enim cum summo labore iecimus fundamenta, quibus sapientior architectus, observata veritatis regula quam in nullo deseruimus, egregrio tractatu artificiosa magis poterit superedificare triclinia.[1]

There can be no doubt that we have rashly undertaken a work far beyond our powers, in the accomplishment of which our language is entirely inadequate to the grandeur of the subject. Nevertheless, we have accomplished something. For just as those who are inexperienced in painting and not yet admitted to the secrets of the art are allowed usually merely to trace out the first design of a picture and apply the rough colors, while later the hand of a more skilled artist adds, with nobler colors, the finishing touches of beauty, so we ever adhering strictly to the truth from which we have in no wise departed, have laid, at the expense of much effort, the foundations upon which a wiser builder by his excellent treatment may erect a more finished structure.[2]

These admirable words, written in the 1180s, by William, archbishop of Tyre, with which I began the first volume of this study discussing the art of the Crusaders between 1098 and 1187, are even more appropriate here at the beginning of this volume dealing with the turbulent years, 1187–1291. Not only is our individual and collective knowledge of artistic monuments in this later period much less extensive, but the historical developments pertaining to the Crusades are also much more complex: politically, constitutionally, militarily, economically, socially, culturally, and ecclesiastically. There were many more Crusades between 1187 and 1291 than between the years 1095 and 1187, and the artistic monuments that can be assigned to this period are more diffuse, unevenly distributed, and, in many cases, less fully studied.

With this in mind we can usefully contemplate a comment made by Matthew Paris in his *Historia Anglorum*. At the point where he is discussing the First Crusade in 1097, he writes:

> Nec mihi videtur a meteria cronicorum et historiarum super eventibus Angliae confectarum alienum, si inceptum opus hoc prosequar subarratum, et bellum hoc inclitum sub brevitate describam castigata; praesertim cum ex hoc totius ecclesiae universalis status et conditio, immo etiam fidei Catholicae ipso tempore dependeret.[3]....
>
> The Crusade was "the common enterprise of all Christians.... It does not seem to me irrelevant in chronicles and histories of English affairs... to describe briefly this glorious war, especially because on this depended at that time the whole state and condition of the entire Church, or indeed of the Catholic faith itself."[4]

This passage can be paraphrased here in the following manner with reference to our study:

> Because the Crusade was the common enterprise of all Western Christians and Franks resident in the Holy Land, it does not seem to me irrelevant in our inquiry into Crusader artistic activity to describe briefly this glorious war, especially because on this depended at that time the whole state and condition of the entire Church and the Crusader States in the Near East, or indeed of the Catholic faith itself.

Because of the growing interaction among the political, economic, military, religious, and artistic developments in the Crusader States, the kingdom of Cyprus, the Byzantine Empire, the Latin Empire of Constantinople and Frankish Greece, the kingdom of Armenia, and western Europe, it is indeed essential to provide a basic framework for our study in terms of the historical discussion of the Crusades. On this foundation we can then investigate the basic art historical issues, that is, what work was commissioned and executed for whom? What can we identify and discuss according to archaeological finds, to existing monuments, to indirect indications from other works of art, to the written documents, and to the narrative historical sources? What extant artistic work can be identified, evaluated, and contextualized in the circumstances of the Crusader East either in situ or in collections around the world? What major artistic developments can be recognized that may help us to construct a meaningful picture of Crusader art between 1187 and 1291 on its own terms and in relation to developments in Romanesque and Gothic art as well as the art of the *maniera graeca* in Europe, of Byzantium, and of the Near East, both Christian and Muslim?

I want the reader to know that I have endeavored to keep my historical narrative to a reasonable minimum, but the narrative perforce exists and has four important, indeed essential, aspects. First, the narrative is meant to provide a context for discussing the works of art: When such works exist, how do they relate to then-current events? When they do not exist, why do certain works of art and architecture not survive? Ideally, the choice of narrative could be directly related to extant works, but sometimes other narrative is required to carry the story along. Second, the narrative is intended to locate references to works of art that survive only in the written sources, mentioned either in the chronicles or certain other documents. What light can our knowledge of the existence of these works of art shed on our overall picture of the development of the art of the Crusaders from 1187 on, even if we do not have the work of art itself to study? Third, the narrative is meant to provide a framework for the complicated historical developments between 1187 and 1291, which although well-known to those who study the history of the Crusades, are not nearly so familiar to other medievalists or scholars in general. By attempting to put together a narrative of the historical events with questions about artistic monuments always in mind, I hope to be able to make the existence of certain works of art more understandable and to see them in proper perspective. Finally, the historical narrative, with its emphasis on the telling of the story of the Crusades and the Crusaders, and their art, based on the fundamental works of Steven Runciman, Hans Mayer, Jean Richard, and Jonathan Riley-Smith, among others, aims at a discussion that always emphasizes the view from the East. Although this kind of narrative and the issues it addresses may not necessarily reflect the current interests of research in Crusading history, I have endeavored to use the most up-to-date bibliography possible to provide the fullest account of events and the most enlightened options for historical interpretation in light of current scholarly opinion. In sum, the narrative history presented in my discussion is directed mainly at art historians who will find in it a guide to the complex context in which the works of art and architecture must be studied.

It is evident that the art of the Crusaders from the twelfth century is best known and recognized; indeed, until comparatively recently, developments in the thirteenth century have been little known and studied, except in terms of architecture. It is remarkable that the revival of study in the field initiated by Hugo Buchthal and Kurt Weitzmann in the period from 1957 through the 1960s shed important light on thirteenth-century material in terms of manuscripts and icon painting, respectively. Other scholars since that time have made contributions in many areas, including especially architecture, metalwork, numismatics, and monumental painting. There has also been unprecedented discussion of new material stimulated by the presentation of new studies in papers at national and international meetings of medievalists, including, in particular, conferences of the Society for the Study of the Crusades and the Latin East.

The bibliographies by H. E. Mayer, especially *the Bibliographie zur Geschichte der Kreuzzüge* (1965) and in volume 6 of *A History of the Crusades* (1989), provide an invaluable point of departure (up to 1988) for all scholars of the Crusades in dealing with the historical and the art historical material essential for research in this field. The essential supplement to this bibliography is the annual publication of the *Bulletin* of the Society for the Study of the Crusades and the Latin East, which started in 1981 and entered its twenty-first volume in 2001. In 2002 the *Bulletin* and its bibliographical record were incorporated into a new publication, *Crusades*, which also includes new scholarship in the form of articles and reviews. Other indispensable annual bibliographies for scholarly readers in Crusader studies include those found in the *Byzantinische Zeitschrift* and the *Revue d'histoire écclésiastique*.

The overall shape of my study is largely determined by the historical developments in the Crusader States between 1098 and 1291 as found in the written sources with relevance to the arts. For the period 1187–1291, however, the chronological divisions by kingship, so useful for the twelfth century, cannot be continued systematically for various reasons. Besides the political turmoil that will unfold in the retelling of the story, there are substantial portions of our period in which there was no king, or, to put it more accurately, the nominal king of Jerusalem was not resident in the Latin Kingdom. Thus the organization of our discussion is shifted to a structure that combines identifiable political segments in the Crusader States with the various Crusade expeditions. These Crusades not only become more numerous in this period, but they also have a major impact throughout this period on the circumstances of the Frankish East in general, and on the embattled Latin Kingdom in particular.

This change in the organization of the discussion reflects essential changes in the historical realities of the Crusader East in the thirteenth century. It does not, however, mean that our point of view has been altered: Our vantage point on the artistic developments of the Crusaders continues to be maintained from the perspective of the Latin Kingdom. We must understand, however, that the territorial, political, and ecclesiastical configuration of the Latin Kingdom and the other mainland Crusader States in the period from 1187 to 1291 is considerably changed from that of 1099 to 1187, and it changes continuously throughout the thirteenth century. I have endeavored to illustrate some of these dramatic changes by commissioning a set of maps that will help the reader envision how different the political and military circumstances were.

Structuring our discussion in accord with the sequence of the various Crusades as related to the Crusader States is meant to enable me to present the artistic material in an intelligible and specific historical context. I of course focus on major monuments, patrons, artists, and events and argue for such developments in the art of the Crusaders as can be seen and documented. Because, even in the thirteenth century, we know the names of so few "artists," and the identifiable "hand" of an individual artist rarely appears for more than one or two major works in the highly transient world of the Crusader East, I have continued to resort to the traditional categories of artistic "media," that is, architecture, sculpture, painting, and the "minor arts" of metalwork, enamels, coins, seals, pottery, and textiles. Although perhaps undesirable in principle, I originally adopted this approach with several aims: to balance considerations of architecture with those figural arts that have in the past been given less importance; to integrate significant "minor arts" (especially coins, seals, metalwork, ivory carving, and textiles) within the framework of discussion of the main – larger – media; to clarify the characteristic elements of Crusader art as it evolves; and to identify, analyze, and discuss the various arts extant within each chronological phase of development. I should also reemphasize two other important points. First, the so-called minor arts have been treated here as major media, as befits their importance in the medieval period, quite in contrast to their somewhat marginalized categorization in modern times (i.e., in the eighteenth century and later). Second, bearing in mind that the medieval idea of "art" in the thirteenth century (rooted in the monastery and church, the guilds and the newly developing commercial workshops, and the notions of craftsmanship and function) was substantially different from and more inclusive than art as discussed and practiced in the European academies of the 1600s and later, I have sought to give attention to any and all important Crusader art for which there is evidence from the objects themselves or, failing that, from reflections of this art in other works or in the written sources.

It is clear that the historical circumstances of the Crusader States in the period 1187–1291 differed fundamentally from the earlier, twelfth century, and furthermore they changed rapidly. At the time of the Third Crusade following Saladin's conquests, the Crusaders held only small pockets of territory along the coast around Tyre, Tripoli-Crac des Chevaliers-Marqab, and Antioch (Map 1). The Third Crusade briefly restored the coastal holdings of the Latin Kingdom from Ascalon to Tyre, including the new capital city of St. Jean d'Acre, where most of the major institutions of the Latin Kingdom were transferred and relocated from Jerusalem. The Holy City itself and the other two major holy sites, Bethlehem and Nazareth, remained in Muslim territory. The Third Crusade also restored coastal control from Beirut to Gibelet and Botron, that is, the northern part of the Latin Kingdom that was eventually united to the southern part by military action of a later German expedition in 1197 that captured Sidon (Map 2).

This precarious situation was not otherwise much improved by the brief "German" Crusade, nor by the Fourth Crusade, which was, of course, diverted to Constantinople, nor by the Fifth Crusade (1217–21), which concentrated its efforts on an ill-fated attack on Damietta in the Nile delta (Map 3). Significant if brief expansion occurred in the period, 1229/39–41 with the Crusades of Frederick II, Thibaut of Champagne, and Richard of Cornwall. As a result of Frederick's diplomatic negotiations with the Muslims, access to Jerusalem, Bethlehem, and Nazareth was regained; Thibaut and Richard also regained Ascalon by treaty, along with territory east of Nazareth and Toron, including Belvoir, Tiberias, and the Sea of Galilee (Map 4). This was the high-water mark of Crusader holdings in the thirteenth century, but the tide soon turned. In 1244 the Khwarismian Turks swept down from the north, took Jerusalem in August, and then together with the Egyptians inflicted a crushing defeat on the Crusaders at La Forbie near Gaza in October. Jerusalem was never again controlled by the Crusaders, and despite the valiant efforts of Louis IX in the early 1250s (Map 5), with the rise to power of the Mamluks in Cairo, the Crusader States began to shrink under their relentless attack from 1263 on (Maps 6 and 7).

In these circumstances the holy sites that had played such a preeminent role in the twelfth century would not, indeed could not, maintain the same artistic importance in the thirteenth. This does not mean that pilgrimage to the holy sites was less valued or desirable or that pilgrimage necessarily diminished. Pilgrims still came to the Holy Land and wrote accounts of their visits to the holy places. Indeed along with the traditional sites, certain pilgrimage centers became newly prominent in the thirteenth century, such as St. Catherine's Monastery on Mount Sinai or Saidnaya in Syria, as well as the shrine of Our Lady in the Cathedral of Tortosa/Tartus. Because many of these pilgrimage sites were, more often than not, behind Muslim lines, Crusader art could only be alive in the major holy sites during the comparatively limited times of open access. Crusader art developed differently at other open sites. We must attempt to understand how and when Crusader art was produced in these other sites, especially at Sinai. Certainly one focus of Crusader artistic production shifted to the coastal cities, most of which were not pilgrimage centers with holy sites, especially Acre. It is only toward the end of the thirteenth century that a systematic route for pilgrims was established in Acre itself, apparently to fill partially the void left vacant by lack of access to the major recognized holy sites. One of the challenges of studying Crusader art in the thirteenth century is identifying where the centers of new artistic production were located in pilgrimage, commercial, and political and military centers and strongholds and how these centers functioned.

The changes in the Crusader circumstances mentioned earlier indicate that Crusader artistic production was very different after 1187 from what we encountered in the Latin Kingdom, 1098–1187. It means, for example, that the major castles become more important centers of production, and because a number of these castles are located in the north, that is, in the County of Tripoli and the Principality of Antioch, the mix of extant Crusader art will be different. It means that the major port cities with their distinctive commercial-political-religious multicultural character will play a much more important role as the setting for the production of Crusader art compared with the inland pilgrimage sites. It means that because Constantinople came under Crusader control from 1204 to 1261, and Cyprus under Lusignan French control from 1192 on, contact with the Byzantine artistic tradition changed to a position of greater direct access for the Crusaders in the East, and we will evaluate the results in Crusader art from the Latin Kingdom. Because the political fortunes of the County of Tripoli and the Principality of Antioch become intertwined with the kingdom of Armenia especially in the years after 1252, we shall look to see what contribution the venerable Armenian artistic tradition makes to Crusader developments. Most of what we know as extant Crusader art in the thirteenth century is much less well studied compared with that produced in the twelfth, and thus our voyage of discovery here will be filled with new perspectives as we attempt to find out what happened artistically – that is, how, when, where, why, by whom, and for whom?

The reader should be aware that in dealing with the Crusader developments of the thirteenth century, we enter a different and complex period in the Frankish East. Our focus must be maintained on the mainland Crusader States in Syria-Palestine. I do not attempt to discuss developments in Lusignan Cyprus, in the Latin Empire of Constantinople, in Frankish Greece, in the Kingdom of Armenia, or later on Rhodes, except insofar as they have direct relevance to our story. A brief preliminary survey of much of this material was included in Volume 4 of *A History of the Crusades* (1977), and much important work has been done on the artistic developments in those regions since then. Indeed each of these other areas deserves a full and separate study, but this will have to await the contributions of other scholars currently at work. It will become obvious nonetheless that developments on Cyprus, in Latin Constantinople and the Morea, and in Armenia will have great importance for our understanding of Crusader art in Syria-Palestine between 1187 and 1291.

My goals have not changed from those stated in the first volume even though the art and the historical circumstances that surround that art are very different. The history that follows is an attempt to discuss what we know about the art of the Crusaders in the Holy Land, using art historical method to its fullest potential for synthetic interpretative study. The evidence is notably fragmentary and incomplete, even more so for the thirteenth century than for the twelfth. The scholarly work – archaeological reports on and art historical studies of the monuments, editions of the written sources, historical studies, and interpretative essays and monographs in all fields – leaves gaps, large questions, and many excruciatingly vague and tantalizingly provocative developments to be dealt with. In these circumstances rigorous care and precision are required and are much to be prized. The facts that can be known with certainty have been clearly stated and differentiated from other less secure hypotheses that perforce carry the story along. These hypotheses, however attractive, must be recognized as only possible or probable at best, as the case may be. I again beg the reader's indulgence in coping with a story that deserves to be told but sometimes seems to have so little to sustain it.

In the thirteenth century especially, certain periods and certain places contain little Crusader art; extant work seems to be extremely limited at times, but these fallow periods are necessarily part of the story as well. Sometimes there seems not to be any work that can be discussed. Sometimes Crusader work is known to have been done, such as the architectural work on fortifications or major buildings, but there is no written evidence to specify what exactly that work was, nor can it be identified in the archaeological record of the site. In those cases for which the evidence is slight, hidden, and unrevealed, or does not exist, I have chosen to refer to what is known briefly and judiciously, but not to speculate excessively on what cannot be demonstrated with hard evidence.

Historiographically it is evident that previous scholars have focused on certain periods in the history of Crusader art, as I have already noted. In the twelfth century it was the period 1130–87. In the thirteenth century it has been the period 1250–91. This leaves a significant hiatus in the years 1187 to 1250. Not only did the situation of the Crusaders change dramatically in 1187, but the settings for the production of Crusader art also changed. To what extent did Crusader art continue in the dark days after 1187, and then in the face of the Third and later Crusades up to the time of the arrival of Louis IX in the Holy Land? After the Third Crusade, how did the Crusaders in the Latin Kingdom view the shift in military strategy which identified Egypt and Cairo as the primary target for attack as a means to regain the Holy Land? How did that shift affect the Latin Kingdom? How did the production of Crusader art in the Latin Empire of Constantinople compare to that of the Latin Kingdom of Jerusalem after 1204? What roles do Latin Constantinople and Frankish Greece, Lusignan Cyprus, and Armenia play as stimuli for Crusader art on the mainland in comparison to artistic, military, ecclesiastical, commercial, and cultural interchange with western Europe? I can only attempt to comment on these questions insofar as evidence presents itself in the art and written sources of the Crusaders in the Holy Land. In the face of what appear to be increasing links with the West, through numerous Crusade expeditions, through trade, through political and ecclesiastical appointments, even through the importation of western European works of art and Western artists, how does Crusader art change and develop? In fact, how and to what extent does Crusader art maintain its multicultural character established in the twelfth century? These are all important questions that, as opaque as they may seem, must be penetrated, opened up, and explored to the extent possible. Can it be that overwhelmingly the main artistic developments in the Latin Kingdom after 1187 are found only after 1250, at a time when the political and military circumstances of the mainland Crusader States – after a brief respite through the efforts of Louis IX – were headed into a steep decline? Seen against the outpouring of work hypothesized in the period 1250–91, the relatively meager production identified between 1187 and 1250 must be reassessed. There is no doubt there were major changes and developments in the artistic production, the artistic patronage, the functions of the art, the economics of the art, the audience, and the reception of the art in the Latin Kingdom from 1187 to 1291 compared with the years 1098–1187. Our project here is to investigate these changes and try to understand the salient characteristics of this Crusader art seen against the background of historical and art historical developments in the Frankish East and Gothic Europe.

In attempting this study, I am, of course, the beneficiary of a rich outpouring of recent scholarly work, especially since 1957. As part of that corpus of inquiry and interpretation, certain important issues have been raised and debated: "What is a Crusade?" and "What is a Crusader?" The discussion about the idea of the Crusade also stimulates the discussion about the nature of the art of the Crusaders on mainland Syria-Palestine. Just what is "Crusader art"; in what ways are we justified in referring to Crusader art and what does the concept mean? How does Crusader art in the thirteenth century differ from contemporary Byzantine art; the art of the Mediterranean lingua franca; Armenian art; East Christian art of the Syrians, Maronites, and Copts; Muslim art; Italian art; the Italian art of the *maniera graeca*; and Gothic art? How does Crusader art in the Crusader States of Syria-Palestine differ from Crusader art in Constantinople, in Frankish Greece, or in Cyprus? Without denying the existence of different versions of Crusader art in these other places, I want to be clear and state once again that I am only attempting to discuss Crusader art in the Holy Land, that is, on the mainland of Syria-Palestine. It is there that the art of the Crusaders was born in the wake of the First Crusade, and there that it died as the result of the loss of Acre in May 1291. Other studies by other scholars will explore the important variants of Crusader art in Constantinope, in Frankish Greece, and in Cyprus. Here I am only dealing with the art of the Crusaders in the Holy Land.

Several scholars have meanwhile challenged the idea of Crusader art wherever it may be found on different grounds, some historical, some art historical. I propose to reply to these challenges in my concluding remarks, after attempting to discuss the historical development of this art from 1187 to 1291. With these challenges in mind, however, I provisionally define Crusader art as pilgrimage art; ecclesiastical art; royal art; art for the military orders, especially the Hospitallers, the Templars, and the Teutonic Knights; religious and secular art for knights, nobles, bourgeois, and merchants individually and in confraternities; and art done for the Crusaders who took the Cross and settlers and traders who came to the Crusader Levant in the wake of the great expeditions, be they Frankish kings, queens, nobles and aristocrats, soldiers, ecclesiastics, members of the military orders, pilgrims, travelers, businessmen, merchants, farmers, or whoever, in the Crusader States of Jerusalem, Tripoli, or Antioch.

In sum, I propose that there can be no doubt that Crusader art existed in the thirteenth century on mainland Syria-Palestine, just as it existed in the twelfth, but it is significantly different and more diverse. Understanding how it changed from the twelfth to the thirteenth century and articulating what these changes were comprise a major part of our challenge. What we understand by Crusader art in the thirteenth century must be very clearly identified, analyzed, defined, and interpreted. Although on the one hand I do not wish to make excessive claims or be overly inclusive in regard to this idea, I seek to recognize it comprehensively and to understand it as fully as possible. On the other hand Crusader art by our working hypothesis does not include the art of indigenous Eastern Christians done for their own communities. Whereas the art patronized and produced by the Orthodox Greeks or Arabs, Syrian Orthodox or Jacobites, Maronites, Armenians, Copts, Ethiopians, or other oriental Christians from their own artists is relevant and important to the understanding of what was done for the Crusaders and the Frankish settlers in the Crusader States, the art of these Eastern Christians is distinct from the art of the Crusaders. Nonetheless we should realize that sometimes "Crusader" patrons employed and "Crusader" clients bought from local Christian artists as well as from "Crusader" artists. Therefore, I am suggesting that sometimes what is "Crusader art," whoever its artist may have been, is that art which was made to function for a Crusader in a context or setting identified by a Crusader.

In these terms a "Crusader" patron or artist can obviously mean a *crucesignatus* or a first-, second-, or third-generation Frankish settler. A Crusader patron or artist can also mean an Italian merchant or the offspring of a Crusader and a local Christian, the child of a Crusader and a "converted" Muslim, or the progeny of a turcopole and a Frankish woman, in the Crusader States. Mostly what is Crusader art is a work made by a Crusader artist, whoever the patron or the recipient may have been. I shall address the idea of a Crusader artist, and Crusader style, as I attempt to define how a Crusader artist is distinct from other artists. Most Crusader art, I propose, was produced by a Crusader artist, not by a Byzantine or a Byzantine-influenced Italian or French artist.

Our proposition at the outset, therefore, is also that the major art produced in the territory of the Crusader States in Syria-Palestine for Crusader patrons between 1098 and 1291 was Crusader art. On this basis it merits being called "the art of the Crusaders in the Holy Land," rather than "colonial art in the Crusader States" or "the art of the Frankish settlers." Indeed, in approaching the art this way, we insist on seeing it from the vantage point of the Crusader East, through the eyes of its patrons and artists. This means that our points of departure are places such as St. Jean d'Acre, Tyre, Tripoli, Antioch, Margat/Marqab and Crac des Chevaliers, and St. Catherine's, Mount Sinai, instead of artistic centers in western Europe.

My hopes in preparing this study are many. I wish to remedy the obvious and essential problem that, for many persons, Crusader art does not exist because there is no study that attempts to present it as a coherent chapter in the history of medieval art with adequate photographic documentation. I wish to present the art of the Crusaders on its own terms, as something unique and different, not as the mere derivative of something else. I wish to formulate and articulate an idea of Crusader art in terms of its nature and development in the period 1187–1291 that will give it substance and meaning, not only with regard to the art of the Crusaders in the twelfth century but also in regard to the Romanesque and Gothic art, to the art of the *maniera graeca*, and to the Byzantine, Armenian, and Muslim art to which it can be compared. I wish to confront the major questions about Crusader architecture and figural art in this turbulent period, ranging from the enormous output of architectural work in the first half of the thirteenth century, to the apparently curious and conspicuous lack of extant works of figural art between 1187 and 1250, to the veritable explosion in art production of figural works, both religious and secular, during the last forty-some years of the Latin Kingdom. Finally, as the beneficiary of important work done by many scholars in recent years and bearing in mind that there are no doubt many new discoveries yet to be made, I wish to set out to the best of my ability the essentials of what we now know about the art of the Crusaders, synthesized in historical context.

My goals then are the following. First, I want to identify, contextualize, analyze, discuss, and interpret the art of the Crusaders between 1187 and 1291 in Syria-Palestine. Second, I wish to understand how the art of Crusaders after 1187 differs from that before 1187. Third, I would like for this analysis to enable us to see more clearly what questions remain to be addressed and what gaps in our knowledge will need to be filled.

Finally, our story of the art of the Crusaders in the Holy Land ends in 1291 when Acre falls and the Mamluks expel the Crusaders from mainland Syria-Palestine. But recalling the words of William of Tyre with which we began, we hope, "at the expense of much effort," to have laid "the foundations upon which a wiser builder by his [or her] excellent treatment may erect a more finished structure."

I

REFLECTIONS ON THE HISTORIOGRAPHY OF THE ART OF THE CRUSADERS IN THE THIRTEENTH CENTURY

The beginnings of the modern European, and especially French, rediscovery of Syria-Palestine can be conveniently dated to Napoleon's campaigns in the Near East from May 1798 to August 1799. Shortly thereafter, J. F. Michaud began publication of his *Histoire des Croisades*, starting in 1811, drawing attention to the history of the Crusaders in the Levant.[1] This was followed by the great project sponsored by the Académie des Inscriptions et Belles-Lettres to publish the major medieval texts dealing with the Crusades, starting in 1841.[2] Study of the material culture of the Crusaders was begun in terms of coinage and the first attempt at a comprehensive study appeared in 1847 by Louis Felicien de Saulcy.[3] Interest in the Crusaders was indirectly intensified in France during the Crimean War (1853–6), in which one of the major issues was French protection of Christian pilgrims to Jerusalem and Catholic rights and privileges at the holy sites under the Capitulations of 1740.[4] Four years after the war ended, in 1860, the count Charles-Jean-Melchior de Vogüé, eventually the Marquis de Vogüé (1829–1916), published a pioneering study titled *Les Eglises de la Terre Sainte*. This book marked the beginning of modern research into the art and architecture of the Crusaders in the Holy Land.

Historiographically, therefore, the origins of the study of Crusader architecture and art can clearly be located in the context of French scholarship of the nineteenth century. The issue relevant to our current inquiry is, to what extent did these early scholars recognize both Crusader architecture and Crusader artistic work of the thirteenth century and how did they differentiate this work from that of the twelfth? What criteria did they use to identify the work? How did they date it? In view of the fact that the holy sites of Jerusalem, Bethlehem, and Nazareth, even when accessible, were largely out of Crusader control in the period between 1187 to 1291 and that these sites had been major centers for the production of the art of the Crusaders in the twelfth century, how did scholars characterize the nature and development of Crusader art in the thirteenth century?

I

De Vogüé's father was a friend of Alexis de Tocqueville, the French minister of foreign affairs, and through this connection he was able to launch his son on a diplomatic career. It was while he was posted in St. Petersburg in 1850 that the young de Vogüé discovered his interest in archaeology. He first went to the Levant in 1853–4, just at the time of the Crimean War in which France was a major protagonist against Russia. One of the issues in dispute, of course, concerned privileges at the holy sites in Palestine. On 19 November 1853, Melchior saw the Holy City for the first time. It made a tremendous impression on him, as he records in a letter to his father:

> J'ai aperçu pour la première fois . . . la ville sainte . . . et je n'ai pu contenir mon émotion à la vue de ses murailles vénérées. Depuis le matin j'avais comme une fièvre qui me poussait en avant, à la grande stupéfaction de ma monture dérangée dans ses allures pacifiques: et sitôt que j'ai vu poindre au loin et briller au soleil les dômes de Sion, l'émotion a éclaté et je me suis jeté en bas de mon cheval pour remercier le Seigneur de m'avoir amené jusqu'ici.[5]

Thereafter he returned frequently to Jerusalem up to his last visit in 1911, only a few years before he died.[6]

I have already discussed the context for and the argument in de Vogüé's book elsewhere, as well as his methodological approach.[7] The view he took of the Crusader experience is summed up as follows:

> Les Croisés avaient transporté en Palestine la société du moyen âge tout d'une pièce, avec ses hiérarchies militaires et ecclésiastiques, ses coutumes féodales, et jusqu'a ses dénominations. Les constructeurs venus à leur suite ou pris dans leurs rangs firent de même; ils transplantèrent au milieu des édifices byzantins et arabes les églises françaises de la mère patrie, avec leur nefs hautes et allongées, leur bas cotés, leur systèmes de voûtes, enfin tous leurs éléments essentiels.[8]

But what is especially relevant to examine here is his perception of thirteenth-century architecture, its nature, and its development, in contrast to that of the twelfth century, in the Crusader States. De Vogüé approached the study of Crusader churches as the work of French architects who produced buildings in three phases: phase 1, from 1099 to 1187; phase 2, from 1187 to 1291; and phase 3, on Cyprus from the thirteenth to the fifteenth centuries. Essentially he argues for the importation of Romanesque architecture from western Europe as the basis of Crusader architecture, and he sees the development of Crusader art as controlled by French artistic ideals. Although he championed the view that the Crusaders brought Romanesque architecture with them he was, however, well aware of two aspects that influenced it in its new setting. He noted that the local climate, materials, and local masons were different from those of France; he also recognized that local Christians had their own architectural traditions that were quite distinct from those of the Crusaders. One, of course, was the tradition of Byzantine architecture with domed centralized churches, at that point little studied, and the other derived from the Early Christians with longitudinal, basilican-plan churches. Nonetheless, his idea was that however certain parts or details of Crusader architecture were altered by local conditions, the basic character of the Romanesque was not.

De Vogüé identifies the great period of church building in the Latin Kingdom as the years between 1140 and 1180. The bulk of his large and impressive book deals with that phase. By contrast, on the basis of pilgrim's accounts, chronicles, and letters, he says that little was built between 1187 and 1229. He points out that it was only in 1192, at the intervention of the bishop of Salisbury with Saladin, that permission was given for two Latin priests and their deacons to return to the towns of Jerusalem, Bethlehem, and Nazareth, who served in these locations along with a small number of indigenous clergy. In 1211, he notes that four Syrian priests alone said their office in the church of the Holy Sepulchre according to Wilbrand von Oldenburg, and in 1217, Thietmar found Jerusalem closed to Christian access. De Vogüé also cites a collective letter written *c.*1220 to King Philippe II Augustus from the refugee bishops and abbots of the Latin Kingdom living in Acre. They said the Holy Land was deserted and destroyed, reduced to a poverty that could not be expressed in words. The Crusaders, they said, only possessed two cities, Tyre and Acre, and what few resources they had were being diverted to Damietta.[9]

In 1229, with the treaty arranged by Frederick II, Christians were once again granted open access to Jerusalem. De Vogüé interprets certain sources as indicating that Frederick made successful efforts to erase the effects of the earlier destruction. Despite what sources favorable to the emperor may say, however, de Vogüé thinks that all he could have done was to have rebuilt some chapels. Pointing to the ongoing conflict between Frederick and the pope, the interdict placed on the city of Jerusalem, and the absence of resident Crusader clergy in the Holy City, de Vogüé doubts that much Crusader construction could have occurred there between 1229 and 1244.[10]

From 1244 to 1291, Jerusalem was again lost to the Crusaders, and Christian access was difficult. De Vogüé therefore characterizes architectural activity as "quelques constructions se firent" in the cities along the coast, but most of it was military fortification in nature. "Les sources de l'art étaient taries, . . . et, malgré le dévouement de saint Louis, malgré les efforts des ordres militaires, elles ne devaient plus se rouvrir." After 1291 until the nineteenth century, he says that nothing was built at the holy places by European hands except some Franciscan convents, "massive constructions dans lesquelles l'art n'a rien à voir, et dont par conséquent nous n'avons pas à nous occuper."[11]

As to the nature of Crusader architecture in the thirteenth century (and later on Cyprus), he says the following:

> Les édifices du second et surtout du troisième groupe ont un caractère tout différent; ils offrent un imitation parfaite, comme construction et comme ornementation, des églises élevées en France à la même époque, avec cette seule différence: que les toits pointus sont remplacés par des terrasses horizontales.[12]

De Vogüé is important because he gives us our first historical perspective on the developments in Crusader architecture in the period from 1187 to 1291, remembering always that church architecture was his focus. It is evident that in doing this he depends heavily on the written sources, not archaeological examination for these buildings, but he is mindful of the need to study the standing monuments where possible. He focuses methodologically on the churches in terms of architecture and interior decoration, and he also sees his basic approach to be one of comparing churches in the East with those in the West as a source of dating and development. Nonetheless, he finds little important Crusader church architecture in this period and asserts that fortifications constituted most of what was being built by the Crusaders. Unfortunately he does not seriously discuss the major, mostly thirteenth-century church still largely intact at Tartus, and apparently he was unable to investigate in any detail the old city of Acre with its numerous thirteenth-century buildings, including some churches. He apparently assumed that the churches were destroyed by the Muslims. His focus is maintained on the holy places in the thirteenth century, as it was in the twelfth, and he finds nothing new in these locations.

On the issue of thirteenth-century Crusader architectural style and design for churches, de Vogüé deals with the problem of the ogival arch and French Gothic style with a perceptive argument. He proposes that the ogival arch originally developed in France independent of Eastern influence but that it also was found in early Arab architecture in the East. He asserts that the Gothic architecture found in the Levant was primarily that which is found today on Cyprus and was derived from French Gothic sources. He maintains that what the Crusaders found in Syria-Palestine was basically Byzantino-Arab in terms of basilicas, rotundas and cupolas, centralized Byzantine churches, and the ogival arch in the Arab school of Cairo.[13]

J. Wigley had argued that it was the encounter of Crusader Romanesque architecture with the ogival arch in the context of Arab architecture in the Holy Land that engendered the new Gothic architecture.[14] In his counterarguments, de Vogüé focused on Wigley's issues of the ornament and the pointed arch. He observed that arabesque ornamentation does exist in Crusader architecture, but he argued that the basic architectural vocabulary of cornices, capitals, moldings, and so forth came from the West, deriving either from classical Roman sources or from French Romanesque. The arabesques were applied to this system as details, and in any case Gothic ornamentation was largely based on natural forms, not Arab models. For the pointed arch, de Vogüé maintains first that it was developed in western Europe long before the Crusades, for structural reasons but that it also existed in the Levant in Arab architecture, mainly for general usage. De Vogüé proposes, therefore, that the ogival arch the Crusaders found in the Holy Land and employed in, for example, the Church of the Holy Sepulchre in the mid-twelfth century, reinforced their interest in the new Gothic style developing in France. Succinctly put, he says: "L'ogive n'est pas née des croisades, mais les croisades ont pu hâter le jour où elle a été employée exclusivement en Occident." The important issue for de Vogüé was to understand that the ogival arch was not the cause of Gothic architecture; it was a means. In accepting the idea that "l'architecture gothique dérive naturellement de l'architecture romane par une transformation lente dans la science de batir," de Vogüé understood that Gothic was a system of architecture. Nothing of the Gothic system of architecture, he asserted, was borrowed from the Near East.[15]

Thus, de Vogüé stoutly denies what he calls "l'origine orientale de notre architecture."[16] According to him, Gothic architecture was born in France; neighboring countries, including even the Crusader States, were prepared to receive this movement. To some extent de Vogüé sees the Gothic churches in the Near East to have been built by French hands, especially those in Cyprus. Thus he concludes that "dans le domaine des idées, l'influence des Croisades avait été considerable, dans le domaine matériel des faits architecturaux, elle avait été presque nulle."[17] De Vogüé nonetheless sees Crusader architecture as a distinctive phenomenon. To this end he expresses himself in quite emotional terms at the end of his study. Even though in his view the Crusader churches may not change our understanding of the development of Gothic architecture, he sees the Crusader buildings as unique from the point of view of a pilgrim, in their functions marking holy sites.

De Vogüé thereby opened the discussion of thirteenth-century Crusader architecture in the Holy Land, focusing on ecclesiastical architecture. Emmanuel Rey followed shortly thereafter with the first extended discussion of Crusader castles and fortifications.

II

Baron Emmanuel Guillaume Rey (1837–1916) was another prominent French aristocrat who took a passionate interest in the Crusaders. He made three visits to Syria, in 1857–8 in the Hauran, in 1859 at Crac, and in 1864 at Margat, examining most of the major Crusader fortifications in the course of these travels. On the basis of this fieldwork he published a series of studies on the Frankish East between 1860 and 1901. In 1871 his important book on Crusader military architecture appeared.[18] This was the first study that attempted to survey the Crusader fortifications systematically, and it was followed in 1879 by a study of the topography of St. Jean d'Acre, which also broke new ground.[19] Rey, unlike de Vogüé, did not hold a government position but seems to have been a gentleman of means who pursued his Crusader interests vigorously as a member of the Société Nationale des Antiquaires de France.[20]

Rey began his 1871 study by surveying the Crusader States geographically with reference to the main Crusader fortifications. He then introduces the main characteristics of the castles, differentiated as he interprets the origins of their design into two schools. These two schools or types appeared and developed more or less simultaneously according to Rey; they form the subject of the first two parts of his book.

The first school included the castles of the Hospitallers and had for its prototype fortifications constructed in France in the eleventh and twelfth centuries along the western coast and along the banks of the Loire and the Seine. These castles were built on steep, isolated hills to facilitate defense. Their plan corresponded to the shape of the site and featured walls with round towers; inside the western donjon is replaced with heavily fortified entrances through the outer walls into the inner courtyards. From Eastern sources, these Crusader architects borrowed the Byzantine double surrounding wall where the second line of walls commands the first. They developed the stone watchtower, which only appeared in the West at the end of the thirteenth century. They also constructed enormous taluses or glacis in masonry, which as much as tripled the thickness of the base of these walls and formed an effective deterrent to mining and reinforcement against the frequent earthquakes.[21]

The second school was that of the Templars. Here the plan of the surrounding walls mostly followed that of the large Arab fortresses constructed after a design that seems to have been inspired by Byzantine fortifications. In these castles the towers are generally rectangular and advance very little in front of the walls. Thus these defensive constructions depend more on the deep fosses or steep escarpments and the high, thick walls rather than on the protrusion of the towers to deter attackers. These walls are typically built with extremely large blocks of rusticated stone and shallow loopholes comparable to Arab fortresses. Despite the parallels with Eastern fortifications, however, the Latin masons' marks clearly identify these works as Crusader construction.[22]

Rey goes on to identify a third type of castle, which combines the first two types, with emphasis on the second, and which retains the Western donjon in the castle. Rey calls these the feudal type and identifies a series of major examples, including Saone, Giblet, Beaufort, Shaubak, Kerak, and others.[23] Finally he also studies the fortified walls of major cities including Antioch, Tyre, Caesarea, and Ascalon, as well as fortified ports, as the final section of his book on the mainland monuments.

Thus here in this first serious survey, we can identify the source of one of the most long-lived interpretations pertaining to Crusader castles, namely, that of separate Hospitaller and Templar schools of Crusader architecture, which he extends into the thirteenth century. Although modern archaeogical investigations have invalidated many of the perceived distinctions that Rey advanced, in particular the contrast of rounded versus rectangular towers, showing instead that many round towers were rectangular towers with rounded exteriors added later, as at Crac des Chevaliers, Rey nonetheless made several important contributions through his analyses. First, he introduced a framework of discussion based on analysis of the standing monuments and raised the issue of Eastern and Western origins for various design features. Second, he produced important measured drawings including plans, elevations, and sections and produced some isometric views of the castles; there are also twenty-four engraved plates that collectively provided the first set of research documentation to be published for these castles.[24] Third, Rey provides the most comprehensive archaeological study of these castles that had been carried out to that point. In his archaeological approach, however, he omits the discussion of architectural sculpture and other decoration that de Vogüé had included for the churches. And although he focuses on the northern part of the Crusader States and conspicuously omits any serious discussion of Jerusalem, his emphasis is understandable because the great majority of major Crusader castles, if not fortifications, are located in the north, not in the Latin Kingdom. Finally, Rey's archaeological approach is rooted in the same notion of Christian archaeology that we find earlier in de Vogüé and later in Enlart, but it is tightly controlled, intensively descriptive, and linked with historical research to provide some bases for dating major parts of these complex buildings. The picture that results in terms of the history of architectural development for these major Crusader fortifications is important. Even though it contains certain historical errors and differs in certain specifics from the picture we have today, in its day it broke new ground as a paradigm for this kind of study.

To return to the specifics of his survey briefly, following his introduction Rey proceeds to discuss a series of major castles and fortifications, in the following order:

Margat (Margab) is the Hospitaller castle on the coast two hours south of Lattakieh.[25] The triangular plan of the huge castle is determined largely by its site. Rey describes the main standing features of the castle, commenting occasionally on their dating and parallels with fortifications in France. The important chapel inside (23.64 × 9.9 meters with two bays) he dates as contemporary to the churches at Tortosa, El-Bira, Jubail, and Lydda. He describes it as faithful to the construction system and the plan of French churches along the Loire and in Burgundy during the eleventh century. Rey visited Margat twice, separated by four years.

Crac des Chevaliers (Kalaat-el-Hosn) was the Hospitaller castle that guarded the passage from the interior to the cities of Tripoli and Tortosa on the coast, forming one of the main bastions in the system of defense for the County of Tripoli.[26] Like Margat it was a major defensive castle, not a feudal habitation to secure the lands of surrounding fiefs. Crac had two surrounding wall systems, with a fosse between partly filled with water. There was one easily defended entry; the towers and loopholes were organized in a manner in advance of what was found in France. Rey described the castle in some detail starting with the large square south tower, the complex bent entrance, and the wall systems with their massive taluses and round towers, ending with the machicolated rectangular north tower; he records a number of extant inscriptions. He notes that the chapel is smaller than that at Margat but proposes that it was done by French architects trained in the same style as those who constructed Cluny, Vézelay, and Autun. For the dating Rey can only say that the chapel (21.0 × 8.4 meters with four bays) was done at the end of the twelfth century; most of the castle was constructed after the 1202 earthquake; the square tower was rebuilt by Baybars. He follows his descriptive analysis with a historical outline. Rey asserts that after the Crusaders occupied the castle, it suffered damage in a series of earthquakes, in 1157, 1169, and 1202. In 1229 the castles of Tripoli and Antioch, including Crac and Margat, were exempted from the treaty signed by Frederick II with Sultan Malek al Kamil. Finally Crac was captured in 1271 by the strategem of a forged letter that ordered the garrison to surrender.

Tortosa (Tartus) was a Templar stronghold, a fortified town on the coast, south of Margat and almost due west of Crac.[27] As their principal military base in the north, the Templars fortified the castle heavily with a double enceinte in the form of a quarter circle strengthened by fosses, and a colossal donjon.[28] Inside the city walls is found the venerable twelfth-century cathedral, a major place of pilgrimage, which even Jean, sire de Joinville, visited. The castle is found at the northwest corner of the city walls; the latter follow a more or less trapezoidal plan. Rey follows this introduction with a more detailed description of the identifiable remains of the main fortifications including the grande salle, characterized as a European importation to the Near East. This was the main meeting place in the castle where chapters of the order were held. It was "décorée de panoplies, de trophées et d'étendards pris sur l'ennemi, ainsi que de riches tentures qui en complétaient l'ornementation."[29] It was a vaulted room 44 meters long with six bays organized as paired aisles. The castle chapel nearby is only briefly described as having four bays and no apse. The style of both the grande salle and the chapel was seen as quite elegant, with the use of marble capitals and archivolts that were decorated with interlaced arabesques, suggesting Byzantine influence to Rey. On the keystone of one archivolt he observed a paschal lamb holding the oriflamme à la croix.

Chastel-Blanc (Safita) is another Templar castle east of both Tripoli and Tortosa en route to Crac, dominating the hills one enters riding inland from the coast.[30] This castle is a large, heavily fortified tower keep with an outer enceinte; the inner walls around the base of the tower are fragmentary. The outer enceinte is in the form of an irregular polygon. The inside magazines and the interior system of walls are largely gone, transformed into the Arab village at the base of the tower. The donjon is 31.0 × 18.0 meters, with the castle chapel on the ground level. Measuring 25.0 × 10.5 meters, and vaults 17.3 meters high, this large chapel has three bays and an apse; it is quite analogous to the chapels at Crac and Margat with certain changes caused by its location at the base of the tower keep. Stairs lead up to the vaulted grande salle above the chapel, consisting of four bays organized in paired aisles, comparable to that at Tortosa. Although the date of the erection of this castle is unknown, it was captured by the Mamlukes in 1271.

Château Pelerin ('Atlit) was built by the Templars to protect the coast road south of Mount Carmel between Caesarea and Haifa.[31] The castle is built on a natural peninsula surrounded by deep water on three sides and fronted by a circuit of land walls. Rey quotes the text of Jacques de Vitry, which describes how these fortifications came into being. The city walls are anchored with a tower at the southeast corner. The castle has massive paired land walls, but little remains of the complex vaulted chambers described by Jacques de Vitry. Château Pelerin was one of the last castles held in the Latin Kingdom by the Templars in 1291. It was in good condition until the 1830s when it was mined by Ibrahim Pasha for materials to strengthen the defenses of Acre.

These first five castles presented by Rey constitute the most important of the extant examples associated with the Hospitallers and the Templars that he could have known. Through his pioneering efforts, Rey in effect laid the basis for these works to be seriously cleared or excavated during the years of the French and British mandates after World War I. The differences between his analysis and his plans, compared with the extended discussion and the numerous and elaborate plans of Deschamps at Crac des Chevaliers or of C. N. Johns at 'Athlit, are significant, as we shall see. But it was Rey who first, in effect, prioritized these castles, established the methodological bases for discussing them, and attempted to identify their characteristics in relation to their historical connections with the Hospitallers and the Templars, respectively. For all of the works, the dating is attributed largely on the basis of what Rey perceives as the relationship between the remains of the standing monument and the information provided by the relevant historical texts. One must also be cautious in using Rey's dates because his information is "littered with historical errors," to quote one prominent modern scholar.

What follows in his book thereafter is a series of much briefer presentations on a variety of types of fortifications. Rey presents the isolated fortified tower, an important component of Crusader defenses mostly ignored until very recently.[32] After this we find the enigmatic castle of Saone, which Rey sees – along with Kerak – as the quintessential feudal type of fortification that never belonged to one of the orders. He calls it one of the oldest specimens of Frankish architecture, but one the Crusaders only held to 1187.[33] Following Saone, he offers a series of examples that exemplify in his mind the diversity of castle designs executed by the Crusaders based on Byzantine models, work not done for either of the two major orders. It is an interesting series including Gibelet (1107–97),[34] Blanche-Garde (*c.*1140–87), Beaufort (1139–1268),[35] Kerak (1120s–88),[36] Le Toron (1104–87/1219, 1229–91),[37] Montfort (1229–71),[38] Sajette (Sidon, 1227/8–91),[39] and Maraclée (1260–85).[40] Then come defensive systems for ports (Tyre, Acre, Beirut, Gibelet, Laodicea).[41] Rey places these maritime cities in the hands of Italian and southern French merchants and sees the fortifications often to have been erected on ancient Phoenician foundations. For each port city he comments on a notable feature, for example, at Tyre, the chain across the port entrance, at Acre, the Tour des Mouches, and at Lattakia, there was a light tower. Rey has little to say, however, about the city fortifications of Acre or Tyre in general and hardly anything specific about their central importance in the thirteenth century. Finally we find the fortification systems for the major cities, including Antioch, Ascalon, Tortosa, Gibelet (Jbail), and Caesarea.[42] Antioch is given the most discussion, although its walls were essentially Byzantine; Acre is not mentioned in this context. There follows a brief section on three major castles on Cyprus.[43]

Among the interesting aspects of this survey is not only what is included, but also what is omitted. Almost nothing is said about the city walls of Jerusalem or the port of Jaffa. Many inland fortifications in the Latin Kingdom of Jerusalem are largely ignored, with the exception of Montfort, for example, Safed, Hunin, Baniyas, and Belvoir, along with Shaubak in trans-Jordan. But Rey's achievement is very important. He basically locates and visits most of the main monuments, then he lays out the agenda for the discussion of all of the most significant Crusader castles and fortifications, many of which were followed up by later scholars. He does this both in terms of what monuments he discussed, their dating and their historical significance for the Crusaders, and in terms of his methodology of descriptive analysis of their salient characteristics. It is fair to conclude however, that as far as Crusader military architecture of the thirteenth century is concerned for Rey, he views it largely as a continuum with the twelfth century, architecturally and culturally.

M. Rey in fact produced a number of publications on the Crusader Levant, including also a study on the topography of Acre and a book titled *Les Colonies Franques de Syrie au XIIe et XIII siècles*, both published some years after his study on the military architecture.[44] The book clearly presents the Crusaders in the Holy Land as a colonial experience in a multicultural setting,[45] and, as far as the military architecture is concerned, Rey makes no major new contributions to his earlier survey. However, he does provide a comprehensive historical geography that comments on all the major known Crusader sites.[46] Even more importantly for our current concerns, he expands the picture of Crusader artistic interests in the Levant significantly, based especially on written sources, particularly the *Assises de Jérusalem* and the diplomatic documents of the chanceries of Jerusalem, Tripoli, Antioch, and Sis, joined by a selection of the Arab chroniclers. Furthermore, he has interesting and comparatively extensive comments on thirteenth-century Crusader art. Which references to artistic production does he cite?

He expands on the military art in terms of arms and armor, citing changes in the armament of the Crusaders as found especially in images on the seals of the knights, as, for example, the seal of Jean d'Ibelin in 1261.[47] There is also the question of heraldry, which he finds in the Levant as much with the Franks as with the Arabs.[48] Again the major sources are the seals. He expands on the architecture by mentioning the urban architecture of private townhouses and palaces, comparing Wilbrand von Oldenburg's 1212 account of the Ibelin palace in Beirut with the Mediterranean inspired Arab-Norman buildings in Palermo and mentioning the grand salle of the episcopal palace in Tripoli.[49] In the palace in Beirut there was fresco painting on the vaults, mosaics on the floors, and a marble fountain in the courtyard, and in this connection Wilbrand praises the excellence of the Syrians, the Greeks, and the "Sarraceni" as artists.[50] Even more remarkable is his claim that Arab carpenters decorated important rooms in castles with panelling and wainscoting, fine woodwork similar in its high quality to what we find on the minbars of major mosques in the Muslim world of the Near East. Furthermore, the interiors of the living quarters of noble Franks would have had hangings of Eastern silks.[51] There would have been painted pottery,[52] quite possibly even some porcelains from China, and also painted glass.[53] Finally one would find metalwork in copper, and even silver and gold. Rey cites the important inventory of the Count de Nevers from Acre in 1266 with its quantity of notable objects, secular and sacred, including metalwork in precious gold and silver and more utilitarian substances.[54] Clearly much of this material he thought to be the work of Near Eastern artists, not necessarily Crusaders.

Rey cites as an equivalent ecclesiastical inventory of a church treasury the 1209 document from Antioch which lists gold and silver liturgical vessels decorated with precious and semi-precious stones as well as liturgical vestments.[55] Parallel to this inventory Rey also cites the existence of the "evangeliaire [sic] de la reine Melisende." Its binding, "formée de deux magnifiques plaques d'ivoire sculptées et garnies en argent [?], est du plus beau style bysantin [sic]; le dos du livre est fait d'une splendide étoffe de soie brochée de croix d'or [?]."[56] He also mentions a large patriarchal cross of cedar covered in gold and other ornamentation, which contains a number of relics; it is a cross, which Rey says Jacques de Vitry brought from Acre to the West where it is now preserved in the abbey of Oignies.[57] Along with the regular Latin clergy who may have commissioned works of art, there were also of course the members of the military orders, and it is very interesting that Rey cites members of confraternities, half religious and half military organizations known especially in Italy, but also found in the Crusader East, such as the Societas Vermigliorum, the Pisan association at Tyre.[58] Rey also surveys the great variety of Eastern Christians who interacted with the Latin clergy in the Crusader States.

The issue of manuscript books raised by the existence of the Melisende psalter, and referred to in the 1266 inventory in terms of secular "romanz" and "chançonners" codices, stimulates Rey to consider what the Crusader men of letters read and wrote. Rey points out, "ce fut surtout pour l'étude du droit et des coutumes féodales que se passionnèrent un grand nombre de chevaliers d'outre-mer." He says further, "le goût des lettres semblait héréditaire dans la maison des seigneurs de Sagette [Sidon]... Renaud de Sagette était un des hommes les plus instruits dans sciences et les lettres orientales." Even more surprisingly, he asserts, "la plupart des seigneurs francs cultivaient l'étude de la langue arabe."[59] Other fields of lively interest to the Crusaders were medicine, philosophy, mathematics, geography, and astronomy. In medicine, Rey even cites Antioch, Tripoli, and Jerusalem as centers, referring to Theodore of Antioch, Basil of Aleppo at Tripoli, and Abu Mansour in Jerusalem.[60] As evidence for his points, Rey frequently cites Arab medieval writers and in regard to the matter of geography, he even cites specific manuscripts in the Bibliothèque Nationale in Paris and in the Vatican Library in Rome which contain maps that precede the well-known works of Marino Sanudo in representing the Frankish East in detail, even including distances between specific sites in the Holy Land.[61]

What is interesting and relevant from this remarkable assemblage of material that Rey presents in his groundbreaking work is that, with the exception of the Psalter of Queen Melisende, everything cited here is either to be dated to the thirteenth century or is directly relevant to or derived from the Crusader States in the thirteenth century. Thus in effect, Rey makes a strong case for investigating further the art of the Crusaders as well as the architecture. This art is basically defined as commissioned or acquired by them from Near Eastern artists – he never really entertains the idea of "Crusader" artists – or as imported by them from the West.[62] What is also evident is that Rey is looking at the Crusaders and their art largely along class lines. Not surprisingly, to some extent he seems to be seeing the Crusader aristocracy the way the nineteenth-century French upper class wished to see them. For example, he says: "Nous devons, d'ailleurs, reconnaitre que la noblesse franque fixée en Syrie était généralement beaucoup plus lettrée, plus sage et plus prévoyante qu'on ne l'a cru jusqu'à ce jour."[63] It is after all members of this same upper class who admired the pictures of their Crusader ancestors in history paintings of events in Crusader history produced in the first half of the nineteenth century by a number of artists (including Delacroix) and hung in the Salles des Croisades at the palace of Versailles by order of Louis-Philippe I after 1832.[64]

III

De Vogüé and Rey are important because they effectively begin the systematic discussion of Crusader architecture (and art, to some extent) including work from the thirteenth century. They were the European scholars who first made contact with the standing monuments as archaeologists, art historians, and historians, as distinct from pilgrims; Rey also identified some important examples in the figural arts, either existing works or textual evidence about such works. Together they set out the agenda for future scholars.

Meanwhile, interest in the Crusades continued to grow. In 1877 a new edition of Michaud's *Histoire des Croisades* appeared, illustrated with a large set of engravings by Gustave Doré. This publication marked "a high point in the religious and nationalistic enthusiasm for the crusades in France."[65] In fact, work on the history of the Crusades, the culture of the Crusaders, and Crusader monuments continued in the last twenty-five years of the nineteenth century by English and German as well as French scholars. With a few exceptions, however, comparatively little attention was directed specifically at Crusader monuments or works of Crusader art understood to be from the thirteenth century. One of the most important publications was a new and remarkably comprehensive study of Crusader coins by Gustave Léon Schlumberger. Published in 1878 with a supplement in 1882, this work remained a standard text into the latter part of this century and can still be consulted with profit.[66] Many of the other publications we have are found in the form of archaeological reports, for example, the Survey of Western Palestine.[67] By this means the repertoire of sites published is enlarged somewhat, but the focus of the survey was on antiquity, biblical and classical, and there are relatively few Crusader monuments. Also, Hans Prutz published a work of cultural history hard on the heels of Rey's later (1883) work, but he is not as interested in the artistic material and contributes more to the study of the military orders in the Crusader States, especially the Teutonic Order.[68]

Not surprisingly, it would continue to be French archaeologists who most intensively addressed the Crusader monuments in the early twentieth century. It was they, and especially Camille Enlart, who introduced important new distinctions between the twelfth- and the thirteenth-century art and architecture in the Crusader States. In 1896, however, there was Charles Diehl, a scholar of quite a different background, an orientalist who studied Byzantium and Byzantine art and addressed "Les Monuments de l'Orient Latin." He summarized and epitomized the French view of the Crusaders at the fin de siècle.

Just as de Vogüé and especially Rey had done before him, Diehl sketched works of art and architecture associated with the Crusaders. He refers to churches and castles, monumental art such as mosaics, frescoes, and sculpture, and small-scale art such as coins; other media are omitted. But in particular he again appropriated the Crusaders as medieval Frenchmen, even more emphatically than Rey if that be possible. The specificity of his language is unmistakable:

> Civilisation féodale, civilisation française aussi. Parmi les chevaliers qui prirent part à la croisade, parmi ceux-là surtout qui demeurèrent en Palestine, la plupart étaient des Français. C'étaient des Normands, et qui gardèrent en Syrie toutes les qualités de la race, que ces princes d'Antioche, les Boémond, les Tancrède, si vaillants et si avisés tout ensemble, si bons chevaliers et si fins diplomates; c'étaient des Provençaux que ces comtes de Tripoli, Raymond de Saint-Gilles et ses successeurs; et sur le trône même de Jérusalem quelle succession de princes français, Angevins comme le roi Foulques,

> Poitevins commes les Lusignan, Champenois comme cet héroique Jean de Brienne,.... Parcourez la liste des grands barons du royaume; tous ou presque tous sont français, Ibelin, La Roche, Dampierre, Montbéliard et bien d'autres; parcourez la liste des frères de l'Hôpital et du Temple; les grands ordres militaires sont presque exclusivement des ordres français: et dans ce morceau d'Europe féodale, transporté sous le ciel blue de la Terre-Sainte, bien vite le français devint la langue officielle de l'administration et le langage courant des relations sociales.[69]

What is striking about this view of the Crusader East is that France and the Frankish Levant are linked so closely. The Crusader States are conceptualized as almost more than a French colony; it is as if they are a massive projection of medieval French civilization directly into the Near East. Yet Diehl characterizes Crusader society as "composite et curieuse," and he perceptively understands that "dans cette société si complexe l'art prit le même caractère." He gives the following interpretation in rather poetic language:

> surtout dans ces petites églises de la Ville Sainte, à Sainte-Anne, au tombeau de la Vierge, nous comprendons comment l'art latin s'est combiné avec l'art oriental, et quelle fleur architecturale, au parfum légèrement exotique, les architectes de France, durant des deux siècles de domination latine, ont fait naître sous le ciel brûlant de la Syrie.[70]

What is also striking from this point of view is that, for Diehl, effectively the "Crusader artist" or the "Crusader architect" was French. Furthermore, there is no essential distinction drawn between the Crusader society, the Crusader experience, or certainly Crusader art in the twelfth century and in the thirteenth century. It is as if they formed a continuum, unbroken, unchanged from 1099 to 1291.[71] To some extent Camille Enlart would eventually challenge that position, while maintaining and explicating the idea of the Crusader artist as a French artist.

IV

French archaeologists worked intensively in the Holy Land in the first third of the twentieth century. Of particular interest for Crusader monuments was the work of Fathers Hugues Vincent and F.-M. Abel in Jerusalem,[72] and that of Father Prosper Viaud in Nazareth.[73] Vincent and Abel devoted a substantial part of their investigations to the Crusader monuments and, in particular, the Church of the Holy Sepulchre, for which they provided the first comprehensive study with detailed plans and measured drawings. In Nazareth, Viaud produced a similar study of the foundations of the Crusader Church of the Annunciation and combined that with the dramatic discovery of the famous Nazareth Capitals. It was on the solid foundations of these and earlier works[74] that Camille Enlart (1862–1927) arrived in the Holy Land, in the period of the French and British Mandates, to pursue his investigations. His research, carried out between 1921 and 1927, resulted in the publication of *Les Monuments des Croisés dans le Royaume de Jérusalem*, the first comprehensive study of the art and architecture of the Crusaders in the Holy Land.[75]

Camille Enlart was an archaeologist and an art historian who had studied at both the Ecole des Beaux-Arts and the Ecole des Chartes in Paris; he was also a member of the Ecole Française in Rome. From 1903 he was the director of the Musée des Monuments Français at the Trocadéro in Paris, known then as the Musée de Sculpture Comparée. Thus by training and by career profession, Enlart was different from de Vogüé and Rey. In addition, Enlart's approach to the study of the Crusader monuments was distinct from that of his distinguished predecessors in three important ways. First, Enlart came to the study of Crusader art and architecture as a mature scholar at the height of his powers toward the end of his career, someone who had extensive experience working in Europe and the Near East.[76] Second, Enlart was commissioned to study the Crusader monuments by the Académie des Inscriptions et Belles-Lettres. Thus he was able to proceed with the full support and cooperation of the Mandate authorities. Third, Enlart defines his agenda at the start of Chapter 1:

> En écrivant ce livre, j'ai voulu étudier dans le royaume de Jérusalem, comme autrefois dans celui de Chypre, l'influence de l'Occident en Orient, et ceci est un dernier chapitre de la vaste enquête que j'ai commencée il y a trente ans sur l'expansion de l'art français du Moyen-Age à l'étranger.[77]

With this introduction, Enlart makes clear that he is pursuing his historical inquiry more or less backward in chronological time. Having started with the Frankish art, culture, and history of Lusignan Cyprus (1191–1474), to which he had devoted a major study published in 1899,[78] he was now addressing the Frankish art, culture, and history of the Crusader States on mainland Syria-Palestine, 1098–1291. By taking this approach, certain questions immediately arise. What relationships will Enlart see between the art of the Crusaders on the mainland and that on Cyprus? What distinctions will Enlart discern between the later art of Lusignan Cyprus and that of the Crusaders which preceded it? How will Enlart characterize the thirteenth-century art of the Crusaders in the Latin Kingdom and distinguish that from the art of thirteenth-century Cyprus? How will he distinguish between Crusader art and the art of the Eastern Christians in the Latin Kingdom?

One important aspect of Enlart's approach was that, in the context of the early years of the twentieth century, he was arguing against the idea that artistic creativity and its influence basically flowed East to West.[79] Furthermore, though he was intensely Francocentric in his outlook, he nonetheless saw and understood some of the complexities and independent characteristics of the art of the Crusaders on the mainland. These components in his discussion can be seen vividly in the following comments. On the importance of France in the Middle Ages, East and West:

> L'art, néanmoins, comme le langage, le droit public et privé furent français chez les Croisés, parce que la France, depuis la fin du XIe siècle jusqu'au XVe, fut le centre et la tête de la civilisation occidentale.[80]

On the character of art in the Crusader East:

> Comme leur civilisation en général, l'art des Croisés est, de toutes pièces, importé d'Europe mais parfaitement acclimaté.[81]

Basically, Enlart saw the architecture of the Crusaders as Romanesque French in origin, but he recognized the Eastern character of much that he found in French Romanesque and was willing to say:

> Tout au plus l'adoption de l'arc brisé, de la coupole sur pendentifs, des voussures à godrons et autres motifs notés au cours de la croisade par l'art roman, fut-elle simultanée chez nous et dans le royaume de Jérusalem....
>
> Qu'ils soient de création occidentale ou d'origine orientale, je me suis appliqué à analyser les éléments de l'architecture des Croisés et à les comparer... avec les monuments similaires d'Occident, surtout en France. Le résultat de cet examen est que, si l'on excepte l'absence presque générale des toitures, les édifices des Croisés ne diffèrent de nos églises romanes, même par une adoption plus fréquente de motifs arabes, arméniens, syriens, coptes ou byzantins.[82]

As a context for this architecture, it is evident that Enlart clearly understands the Crusader States to be essentially French colonies and that the basic development of the political, ecclesiastical, commercial, economic, and military institutions took place in the twelfth century before 1187. He also sees Cyprus and the Crusader States as fundamentally and closely interconnected after 1191/2. The one essential difference between the Frankish population of the Latin Kingdom and Lusignan Cyprus in the thirteenth century is the fact that in the Holy Land the Franks were mostly transient, temporary; they were pilgrims and merchants. But on Cyprus the Lusignans consciously sought to build a resident population both numerous and permanent. Their Frankish settlers, Enlart says, came partly from the West, but they also came in important numbers from the Crusader States and even from Armenia.[83]

Enlart identifies the years of greatest prosperity for the Latin Kingdom as between 1131 and 1174. Soon after that, in 1187, the disasters start, and he finds little in the thirteenth century, after the Third Crusade in 1192, that is positive or notable. Only Frederick II, who reopened the holy sites to Christians between 1229 and 1244, and Louis IX, who rebuilt fortifications and churches while in residence in 1250–4, are identified as bright spots in the deepening gloom. Between 1265 and 1291, he sees the history of the Crusader States as an unbroken stream of losses and defeats at the hands of a series of powerful Mamluk sultans, chief among them, Baybars and Kalavun.[84]

Despite this bleak picture, however, Enlart recognizes the existence of significant Crusader artistic work in the thirteenth century, churches and fortifications, some executed by specific artists and architects. He is the first to think in terms of Crusader work by individual, identifiable artists, but he thinks of them essentially as Frenchmen working in the Holy Land. He identifies Philippe Chinard, *c.*1230, who worked on Cyprus before going to Apulia to work for Frederick II. He names Master Assaut and Garnier de Cordes who worked for Alphonse of Poitiers in 1268. Between 1250 and 1254, he says Louis IX employed certain masters brought from France, including Eudes de Montreuil. Not surprisingly, however, the number of artists identifiable by name is small. Furthermore, Enlart imagines that most were transient; few came East as settlers.[85]

On the issue of Eastern art and artists, Enlart does, however, recognize several ways they were known to the Crusaders. He thinks that Christians were certainly taught about Syrian, Byzantine, Armenian, Copt, and Arab art, by observation and by lessons. He entertains the idea that some artists were Muslim slaves or prisoners, that they could have been given direction, instructed in style, and shown examples in details by Western masters. The Western masters may not have been numerous, but Enlart thinks that just as they can be shown to have worked that way with Muslims later at Rhodes, they must have been found in the Crusader States as well. He does not however, entertain the idea of resident Frankish settlers who were artists despite his recognition of the use of masons marks, some with signatures, indeed in one case with Armenian signatures.[86]

The result of his introductory discussion is the following conclusion:

> 1. qu'il existe une école d'outremer;
> 2. qu'elle est aussi française qu'aucune des écoles romanes de la France;
> 3. qu'elle se distingue très nettement des écoles romanes de France, tout en se rattachant non moins nettement au groupe qui comprend la Bourgogne et les provinces situées au sud de la Loire.[87]

On the problem of how Crusader architecture develops, he has the following to say:

> L'évolution se perçoit peu, les monuments ayant tous été bâtis en un court espace de temps; on remarque une transition du style roman au gothique au Saint-Sépulcre et à Sébaste; elle est la même qu'en France. On constate à Tortose, comme souvent dans le centre et le midi de la France, une alliance de la structure romane à la sculpture déjà pleinement gothique; enfin, l'art français dit gothique réalise les même progrès qu'en France jusqu'en 1291.[88]

Here Enlart's basic conception of the nature of architecture (and in effect the art) of the Crusaders in the thirteenth century is revealed. The same basic stylistic change seen in France from Romanesque to Gothic is found in the Crusader East. For Enlart, the developments in the East are parallel to those in the West; he basically sees the Latin Kingdom and Lusignan Cyprus as part of a French cultural continuum linked to France.

Because Enlart addresses Crusader architecture so thoroughly, he is the first to identify and discuss the notion of Gothic architecture as a part of Crusader developments, something de Vogüé had not really pursued. Enlart accepts de Vogüé's observations on Gothic beginnings at the Church of the Holy Sepulcher (1149) and in the Church of St. John at Sebastia (*c.*1160) in terms of ogival arches and vaults. He also understands the dating and the stylistic characteristics of these churches in the Crusader East to be linked directly and parallel to those of French Gothic churches in the West, even though, one might mention, the export of French Gothic style in architecture did not proceed in this manner in England, Germany, or Spain. But for him, as for de Vogüé, the Gothic style comes from France, not from the Holy Land.[89]

Enlart saw the blossoming of Gothic architecture on Cyprus in the thirteenth century and later to be possible by its preparation in the Latin Kingdom on the mainland, where he finds a series of "édifices de transition." He cites the various Gothic churches of St. Jean d'Acre, the polygonal Church of Chastel Pelerin (1217), the cloister of Belmont (mid-thirteenth century), and the two upper stories – now destroyed – of the campanile of the Church of the Holy Sepulcher in Jerusalem. Even though none of these buildings survives intact, he imagines they could have had the large lancet windows, the flying buttresses, and the gargoyles found in the churches that do survive on Cyprus (e.g., in Nicosia and Famagusta). He also thinks that thirteenth-century Gothic architecture on the Crusader mainland shared certain regional characteristics with Gothic in France. For example, he refers to the Provençal bell tower and the Burgundian façade and portals at Belmont, or the Burgundian character of the Cathedral of Notre Dame at Tortosa (started 1140s, completed after interruptions in the 1250s). (The northern Gothic vaults in the Cenaculum in Jerusalem he thought to be dated *c.*1240, but we now know they date from the 1180s.)[90] On the other hand, some Gothic churches in the Latin Kingdom (e.g., St. André in Acre, 1240s), were modified "pour s'adapter aux conditions et aux goûts du pays" – Enlart sees this as characteristic of the way Gothic was also adapted in western Europe.[91]

A basic assumption of Enlart's is that the development of Gothic architecture on the Crusader mainland followed the same evolution that we find in France. Indeed, Enlart's basic methodology in *Les Monuments des Croisés* is exactly the same as he employed in his monumental *Manuel d'Archéologie Française*, volume one of which deals with "architecture religieuse."[92] Early Gothic is found in terms of "la croisée d'ogives" at the Church of the Holy Sepulcher, at Nazareth, and at Sebaste, where it is combined with a décor purely Romanesque just as we see at Sens, or at Saint Denis. At Tortosa then we find the structure to be Romanesque with the best Gothic-style sculpture, just as we find in the Midi of France (e.g., in the Auvergne). Enlart admits that the Cathedral of Nicosia (started in 1209) inaugurates "le style français intégral," in structure and in ornamentation, what we might call "high Gothic." St. André in Acre was also an example, and it constituted the model for the Greek Cathedral of Sts. Peter and Paul in Famagusta.[93]

At this point, Enlart turns to detailed analysis of architectural parts and components and to what extent they may change in thirteenth-century buildings.[94] What is truly fascinating is that he finds minimal alteration in certain basic aspects of the architecture. The "appareil" and the plans effectively change not at all. Bell towers are more numerous in the thirteenth century than in the twelfth, but are found in both. Six-part vaults are believed to have appeared at the Church of St. John at Sebaste and at the Well of Jacob Church. After the Church of the Holy Sepulcher (1149), four-part vaults with ribs of various forms are proposed for St. André at Acre (1240s), the Hospitaller grande salle at Acre (thirteenth century), at Chastel Pelerin (1217), and in the grande salle at Crac des Chevaliers (thirteenth century). Enlart says, "tous les arcs sont en tiers-point," but we may wonder if perhaps the form of the arches is not more variable and somewhat distinct from the pointed arches developed and used in France in the course of the thirteenth century. Projecting wall buttressing is continued from the twelfth century in some churches, and flying arches are rare, but Enlart claims that the latter surely existed in the churches of St. John and of St. André, both in Acre. Gothic corbels introduce new sculptural decoration in the form of human heads (Chastel Pelerin or Tortosa) or naturalistic foliage (Crac or Belmont). Windows change into lancets, some with limited tracery. Oddly enough, whereas three examples of smallish rose windows are found in the twelfth century, Enlart says none is found in the thirteenth among mainland Crusader buildings. Nonetheless the seventeenth-century engraving of St. André by C. de Bruyn shows three small rosettes above the lancets over the main entrance.[95] Church façades, however, typically have only grouped lancet windows, as seen in this example below the roses. The portals have pointed arches and vertical proportions like the lancet windows, but curiously there seem to be no tympana with sculpture, in contrast to certain twelfth-century churches (e.g., the west façade of the Church of the Annunciation at Nazareth). Finally, the moldings and decorative sculpture on these Gothic buildings seem to be either a continuation of Romanesque types or lovely naturalistic foliage and even animal- and human-headed decorations. The capitals exhibit similar decoration but their shapes sometimes change into complex forms, like certain polygonal examples at Sidon and Acre.

In the final section of his discussion on Crusader architecture, Enlart comments on architectural decoration.[96] There are some surprising findings. Enlart entertains the possibility of stucco revetments in twelfth- and thirteenth-century Crusader buildings, but his main evidence for the thirteenth century is found on Cyprus. He also refers to marble revetments and other kinds of incrustation. Wall paintings are well known from the twelfth century, but for the thirteenth Enlart has only references to examples from Cyprus, either Byzantine or Sienese! Mosaics are equally important, but because most of what survives is Byzantine in style, Enlart does not discuss them. He says, "je n'aborde ici ni l'étude des peintures, ni celle des mosaiques parce que leur style n'est pas français comme celui de l'architecture."[97] This is a telling comment that has major implications far beyond architectural painting; it explains how Enlart approached his study and helps us to understand that Crusader art essentially looks French to him.[98] Certainly some Crusader art is remarkably French, indeed French Gothic in style in the thirteenth century, but our problem will be how to recognize and evaluate important and numerous works of Crusader art that are done in other styles as well.

In surveying the ecclesiastical accessories for these churches, Enlart considers altars, baptismal fonts, episcopal thrones, sanctuary enclosures, and tombs. Again his findings are of great interest. Few altar tables survive, but the examples he cites were preserved in Muslim hands; two are now in Damascus, one in Vienne, on the Rhône River.[99] It remains to be seen if any extant example belongs to the thirteenth century. For both the baptismal font and the episcopal throne, the question is the same: are any of the few examples cited relevant to developments in the thirteenth century? The notion of the decorated sanctuary enclosure is one of the most remarkable of Enlart's ideas. There can be no doubt about the extraordinary wrought-iron enclosure produced for the *Templum Domini* in the mid-twelfth century in Jerusalem, which partly survives today.[100] Enlart also claims there were also similar wrought-iron works for the sanctuaries at Tabor and at Sebaste. These examples constitute one type of enclosure, which is strongly linked to Western church decoration in central France. Much more interesting is the idea of a different sanctuary enclosure for a regular church, which Enlart proposes for the cathedral at Tripoli in the thirteenth century. This type is made of gold and silver, includes figural imagery, and "se rapporter à une cloture de sanctuaire analogue à celles qui restent en usage dans l'Eglise orthodoxe."[101] Athough his source is arcane, to say the least – a sixteenth-century poem by a Syriac bishop on Cyprus about the cathedral church in Tripoli at the time of its capture by the Mamluks in 1289 – this is an important idea worth further investigation.[102] Enlart, of course, knew nothing of the existence of icon painting done for the Crusaders at the time, which strengthens the importance of this idea.

Finally, we have the Crusader tombs among which Enlart proposes five types: a sarcophagus on colonettes, a sarcophagus at floor level, a vertical cross monument, an epitaph set in the wall, or an inscription with or without image on a plaque set in the floor. The first three types are particularly well represented among twelfth-century monuments. Enlart cites numerous examples of type four, which seem to be found in both the twelfth and the thirteenth centuries. Clearly, however, the fifth type is the type of choice in the thirteenth century as found in the mainland Crusader States and on Cyprus.[103]

In the last section Enlart deals with furniture and minor arts. This is a very important discussion because here he defines the possible origins for such work: either imported from Europe or made in the Crusader States by local artisans or by those who have come from Europe and established themselves in the Holy Land. These possibilities result in three categories and two styles; Enlart does not, however, consider the idea of a style made by a resident Frank in the Levant who combines Western and Eastern aspects. The material he discusses is as follows: costume and luxury fabrics, domestic furnishings, iron work, copper and bronze metalwork, bells, the Bethlehem wash basins, silversmith work and enamels, a reliquary found in St. John's in Jerusalem, a processional cross from Belmont, ivory carvings, ebony carvings, and works in "mortier de marbre."

The sources for knowledge of secular costume according to Enlart are the images on gravestones and on seals or clothing referred to in the texts. In the category of liturgical costume he mentions the miter of Jacques de Vitry, now preserved in the treasury at Oignies. Enlart decides this miter is made in western Europe, without saying where, and he does not think it was taken with Jacques de Vitry when he went to the Latin Kingdom between 1216 and 1228.[104] Other interpretations must be considered.

For domestic furniture such as beds and similar objects, Enlart imagines that such carpentry in the East conformed to items familiar to him in the West. However, his example is to compare the bed carved on the St. Peter capital from Nazareth (1170s) to works known to him from Chartres and Moissac. By addressing only Western-style objects, he predictably comes to such conclusions. Here, as in other cases, original objects are necessary to assess the impact of the Levantine context on the Crusaders.[105]

Enlart assumes the ferronerie is imported from France – objects such as sanctuary screens, candelabra, and chandeliers. There is no evidence for this in the twelfth century. For thirteenth-century work, Enlart cites documentary evidence suggesting that it was imported from the West. But even if some specific objects were imported as resources changed, there is no reason to assume that everything not accounted for otherwise must have come from the West. On the contrary, it is more likely, based on current knowledge, that either the artisans came East to do their work or that the work was done in the East by Crusader artisans, that is, fully trained resident Franks.[106]

The metalwork overall is an extremely important category because it includes such diverse material: not only plaques, decorated armor, and enamels, but also reliquaries, seal matrices, bulles of lead, episcopal croziers, and the famous bells of Bethlehem.[107] In these cases, clearly some of this work was imported from the West – there is every indication that more portable art objects were imported in the thirteenth century than in the twelfth – but not necessarily all of it. The Bethlehem bells are a controversial case in point; where were they cast? From our current perspective, the challenge will be to differentiate the imported work from objects done in the East by Western-trained artisans, and other work done in the East by resident Crusader or Eastern Christian artisans. Distinctions of this kind are now possible in terms of painting, which, of course, Enlart did not know and could not consider. Our formidable task will be to attempt this kind of distinction in the metalwork, as well as in other artistic production.

Among the sculptured objects, the ivory covers from the Melisende Psalter are clearly Crusader work of the twelfth century.[108] Despite Cahier's interpretation that they were done in Jerusalem, however, Enlart resists the idea, and he doubts that there were good Western ivory carvers established in the Latin Kingdom. On the other hand, for reasons that are unclear except that he finds the style "attardé, un peu bizarre," Enlart suggests that the ivory crozier of Jacques de Vitry now in the treasury of Oignies is more likely to have been done in the Latin Kingdom.[109] The other special sculptural work Enlart mentions – encriers in ebony and capitals made of "mortier de marbre" – is clearly specialized work that is found mostly in the East.

The various sections of Enlart's introduction to the art of the Crusaders are rooted firmly in research that he published many years earlier when writing his *Manuel d'Archéologie Française*. Methodologically and in terms of individual analyses and interpretations, therefore, there is clearly much in Enlart's overall characterizations to value, but there is also much to challenge. We have already found that when Crusader art and architecture of the twelfth century is looked at today on its own terms, we see it as an independent not a colonial development, it cannot be studied only or even primarily in terms of architecture, it is usually not linked directly to Western developments, its chronology rarely parallels Western chronology, and its multicultural features demonstrate that it is not fundamentally French. Although it is strongly influenced by French developments, there are also strong influences from Italy and Byzantium not to mention the artistic traditions of the indigenous Christians. In fact, it is not French art in the East; it is Crusader art. We must apply the same criteria to thirteenth-century Crusader art and see what we find; and we must look at all of the art: everything that Enlart included, as well as the manuscript illumination, panel painting, and monumental painting that he could not or did not consider.

Whatever our reinterpretation of the nature of thirteenth-century Crusader art may be, however it may differ from his work, Enlart's important achievements in the 1920s cannot be overstated. He surveyed the major architectural material – seventy sites in all – in the Latin Kingdom of Jerusalem and the County of Tripoli – Margat to Gaza and the Dead Sea.[110] He is able to give full attention to the important sites of Jerusalem and Acre with their myriad structures. He introduces certain other major sites and monuments into the discussion, mostly in Syria and Lebanon, hardly mentioned by his predecessors, such as the cathedral at Tortosa, and major churches in Tripoli, Gibelet, Beirut, and Tyre. He is the first to address seriously the idea of Gothic art in the Frankish East. Along with the architecture he is able to introduce important discussions of sculpture and metalwork to go with the monumental painting that de Vogüé had mentioned.

> Finally, the level of sophistication of Enlart's analysis and method enormously enlarged and deepened the terms of the art historical discussion. Not only did he begin the ongoing examination of the nature of Crusader artists and workshops, and mason's marks, based on concrete evidence, but he also brought Crusader art into the forum of discourse on larger issues such as East-West problems, the nature of artistic "schools," and ideas of artistic development in medieval art.... In sum, Enlart introduced Crusader art as a potential new chapter in the history of European medieval art. It was a phenomenon he dramatically revealed with the aid of 196 plates and 598 figures. It was also an art he argued to be much more complex than previously suspected. It is important to realize further that he recast the shape of the argument from one that focused on the art of the Crusaders as the art of the pilgrimage sites to that of a colonial French (and Italian) art in the Crusader states with a focus on "architecture religieuse et civile." His achievement was such that he must be regarded as the founding father of the study of Crusader art. What de Vogüé had begun, Enlart brought to a full conceptual and evidential realization, but the architectural work remained incomplete in regard to Crusader castles.[111]

V

When Enlart "passed the baton" in 1927 to his younger colleague, Paul Deschamps (1888–1974), handing him the opportunity and the responsibility to study the Crusader castles in Syria-Palestine, the younger man at thirty-eight began a project that would occupy him for the rest of his life. The first of his three volumes, on Crac des Chevaliers, came out in 1934; the last, although dated 1973, appeared posthumously after Deschamps died in 1974.[112] Paul Deschamps, like Enlart, was a product of the elite French art history and archaeology establishment. Furthermore, Deschamps followed Enlart as director of the Musée de Sculpture Comparée. About the time he was commissioned to undertake this task in the Near East, Deschamps's most important work had been on Romanesque sculpture.[113] While he was engaged in his research on the Crusader castles, he also published on French mural painting.[114] Of all his publications, however, perhaps his study of Crac des Chevaliers remains his best-known work. Together with the two subsequent volumes, Deschamps studied nearly fifty fortified Crusader sites, and his published presentation goes well beyond the basic history and descriptive analysis found in Rey and Enlart.

Like Enlart, Deschamps recognized his place as following in the footsteps of distinguished French savants before him. Furthermore, as Hugh Kennedy specifically points out, when Deschamps started his work at Crac, he used Rey's drawings.[115]

> Deschamps clearly saw his predecessors to be Rey and Max Van Berchem, students of military architecture, but he understood his task, as he says, as making "un important développement à l'étude de Rey," and, he adds elsewhere, "rectification" of Rey's work in certain cases. One of the important ways he enlarged on Rey was in the rigor of his method and the intensiveness of its application. For the investigation of any individual castle, Deschamps systematically studied and prepared the following: an analysis and characterization of the castle in detail and as a type, on its own terms and in terms of what the Crusaders found when they arrived at the site and nearby; a consideration of relevant models the Crusaders could have used, comparative developments of Crusader castle building and its features, accurate plans and elevations of site and architecture (carried out by his project architects, Anus, Coupel, and Lauffray), and precise identification and location of the site as part of the system of Crusader defenses at any given time. The aim of these investigations is a serious effort to distinguish the various phases and campaigns of the building, and to differentiate the Byzantine, Crusader, and Arab parts of the fabric. Furthermore it was possible for Deschamps as an eminent art historian to expand on art historical considerations about which Rey had had little to say.[116]

The achievements of Deschamps and his architects were remarkable. Not only did their fieldwork produce the most accurate and useful measured drawings of these complex constructions, but also the photographic documentation – including dramatic aerial photos of the sites – is invaluable in light of the subsequent history of these buildings. Photographs for the study of Crusader art had become a reality in the mid-nineteenth century, and the remarkable work of Louis de Clercq, who produced four albums on Antioch and the Holy Land, included one entire volume on Crusader castles.[117] Yet even though Enlart included a number of photos in his two albums, it was Deschamps who really was the first to make full use of photographs for documenting his work.

Another achievement was the fact that in some cases, major clearing work was undertaken. At Crac in particular, the work of clearing took years to accomplish on the part of nearly two hundred men all told. As a result Crac was completely restored with the Kurdish villagers who had lived inside the castle being relocated outside the walls, where they are found today. It is curious in light of this vigorous study and the major clearing activities that no serious excavations of the Crusader castles were undertaken by the French antiquities service at this time. Despite the fact that other excavations on sites from earlier periods were underway at about this time, including the French campaigns at Dura-Europas, Deschamps never initiated a dig. As a result, there has been no French excavation of a major Crusader castle, and most of the few important excavations that have been carried out were done by English (e.g., 'Atlit, etc.) and Israeli (e.g., Belvoir, etc.) archaeologists, along with one American project (Montfort).

The work of Paul Deschamps as *archéologue*, art historian, and historian fully repaid the trust placed in him by Enlart and by René Dussaud, the great French scholar of ancient and medieval Syria who was in charge of the antiquities service under the French Mandate. By 1939 Deschamps had published two major studies on Crac des Chevaliers and on the system of castles organized for the defense of Jerusalem in the Latin Kingdom, both of which remain basic works for scholars today. Thus just before World War II broke out, Deschamps was able to complete his research on the fortifications from Crac des Chevaliers to the south. What he achieved still serves to help guide us in identifying thirteenth-century masonry from that of the twelfth. Even though the work of Paul Deschamps represents for the larger world of Crusader studies the culmination and final flowering of the pioneering French view that Crusader and French were equivalent in the medieval Near East, his legacy along with that of Camille Enlart was to provide us all with a fully structured historical paradigm of Crusader architectural and artistic developments. Even if the French approach consistently subordinated the figural arts to architecture in methodology and the material on Crusader castles only reinforced this modus operandi, the work of Enlart and Deschamps is still the essential and critically important entrée into the task the present study addresses: what Crusader art and architecture can be identified in the period from 1187 to 1291?

New views and different perspectives on Crusader art and architecture had begun to emerge, however. Already many years before Deschamps published his first two volumes, T. E. Lawrence had written a thesis, mainly on twelfth-century Crusader castles, as an undergraduate at Jesus College, Oxford. Lawrence espoused an independent but, as it turns out, not antithetical point of view to that of Deschamps. Lawrence's work was eventually published posthumously, in 1936.[118] Lawrence basically knew nothing of Deschamps's work, and although Deschamps had read Lawrence's study, he only referred to it once in passing in his volume on *La Défense du Royaume de Jérusalem* in 1939.[119] Lawrence's thesis is still worth reading, but it is more celebrated in the English-speaking world than elsewhere, partly because of the fame of the author, and it is certainly not a scholarly work at anywhere near the same level of quality as that of Deschamps. More pertinent here is the fact that only Deschamps seriously addressed the full range of Crusader military architecture from 1099 to 1291, that is, he deals with thirteenth-century architecture as fully as possible, whereas Lawrence concentrated on the twelfth century. Lawrence was, however, a bellwether for another prominent Englishman and fellow Oxonian whose historical work would approach the art of the Crusaders in the Holy Land from a completely new point of view. T. S. R. Boase, writing in 1939, proposed the following idea: "in sculpture, painting and architecture, the West and the East meet and effect exchanges in Palestine: there was also a similar interaction in literature."[120]

VI

Thomas Sherrer Ross Boase (1898–1974) was, in the academic world, along with Kenneth Clark in the museum world, a pivotal figure around the time of the Second World War for advocating the study of art history in England.[121] He came to the study of the Crusades and to the study of the art of the Crusaders as a scholar of medieval history in the English manner. While holding a series of major positions including director of the Courtauld Institute and professor of art history at the University of London (1937–47), and president of Magdalen College, Oxford (1947–68), Boase turned his attention to Crusader art with increasing intensity from the late 1930s until his death in 1974, the same year as Paul Deschamps's death. Boase broke new ground in his 1939 article by interpreting the art of the Crusaders against a European rather than primarily a French background. He also proposed the idea that there was give and take, a genuine exchange of artistic ideas between the Western art the Crusaders brought with them and the art of the Levant which the Crusaders found. Boase was the first in effect to suggest that what was "Crusader" about Crusader art was the multiplicity and diversity of its sources. Although he himself never used the term "Crusader art," he did pave the way for others to coin it.

In 1939, Boase wrote about Crusader art almost exclusively in terms of the twelfth-century examples. He refers to post-1187 developments only in the briefest terms with regard to Crusader castles at 'Atlit (Chastel Pelerin, 1218) and the thirteenth-century phases at Crac des Chevaliers. Shortly after World War II, however, in 1950 Boase wrote the first version of a study that would not be published until 1977, in volume 4 of *A History of the Crusades*, three years after his death. In the meantime, between 1950 and 1974, Boase would also publish two books on the art and history of the Crusaders that clearly indicate how dramatically the field was enlarging with significant new finds of Crusader art, and in what important ways Boase's view of Crusader art was changing.[122]

By contrast with his introductory article in 1939, Boase attempted a comprehensive survey of the material in his later chapters for volume 4.[123] Whereas he does not in effect enlarge the corpus of monuments published by Enlart and Deschamps in architecture – he discusses more than sixty churches and nearly forty castles – he does enlarge it significantly in terms of other media in the chapter titled "Mosaic, Painting, and Minor Arts," reflecting the fruits of recent scholarly work. He also presents a basic introductory attempt at a narrative chronological discussion, even while saying that "it is difficult to trace any clear chronology in crusading building."[124]

It is evident there were major changes in the study of the art of the Crusaders between 1939 and 1977. Which aspects did Boase contribute and who else was instrumental in effecting these changes? Among the important contributions made by Tom Boase himself, we can cite first the extensive use of color plates to illustrate his wide-ranging 1967 text.[125] These plates are effective in conveying a real sense of the building materials and the sites, the texture and color of the stone, the terrain and the overall setting.[126] Secondly, Boase explores the idea of East-West interchange that he introduced, arguing how Crusader figural works were influenced by Byzantine and even Arab art. Boase continued his use of color illustration in his second book, making this work an illustrated narrative history focussed on the Crusaders in the Holy Land instead of on the Crusades, including two of the earliest color plates of Crusader manuscript illumination.[127] Third, although Boase generously acknowledges the pioneering work of de Vogüé and Enlart, he expands on their work by enlarging on their French frame of reference and spending a quarter of his discussion on figural arts they did not know. In dealing with the new material, Boase is cautious, but he focused on the importance of Byzantine influence for painting, unlike the church architecture. Finally, Boase attempts to distinguish thirteenth-century work from that of the twelfth century in all media.

In sum, Tom Boase provided in his series of publications an introduction to the new corpus of Crusader art in formulation, to go along with the known corpus of Crusader architecture. He also made the first attempt to integrate the two and to understand them as Crusader production. To some extent, this endeavor is carried on in the present study. Boase himself was not, however, the investigator who introduced the new manuscript painting or the panel painting to the scholarly world. From the 1950s to 1974, Boase attempted to bring the issues of this important new research into focus for the wider world of

Crusader and medieval studies. Part of the significance of these issues resided in the new importance which manuscript and panel painting gave to Crusader art in the thirteenth century.

VII

It was Hugo Buchthal (1909–96) and Kurt Weitzmann (1904–93), two prominent German scholars trained as Byzantinists, who were responsible for introducing Crusader manuscript illumination and Crusader panel painting, respectively, into the discourse on Crusader art and architecture. Buchthal built a corpus of twenty-one illustrated Crusader manuscripts starting with the well-known but little studied Psalter of Queen Melisende.[128] Fourteen of these manuscripts are dated in the thirteenth century: four in the period *c.*1200–44, ten in the period 1250–91. Not only did Buchthal thereby contribute major new material into the discussion of Crusader art, but he also had important things to say about the nature of this art and the artists in the twelfth and the thirteenth centuries:

> Miniature painting in the Crusading Kingdom ... was not a colonial art. It had a distinctive style of its own, which was not derived from any single source, but emerged as the result of copying illuminations from a variety of Byzantine and western manuscripts, and of developing certain features of these models in a highly original and individual manner.... The masters of Jerusalem or Acre were either foreigners themselves, Frenchmen or Italians who had been specially recruited for work in Outremer, or Frankish natives who had perhaps served part of their apprenticeship at Constantinople, or in some well-known scriptorium in the Latin West. Not only did they work in their own native tradition but, more often than not, they were also given models to copy which had been imported from a different region of the Latin West, or from Byzantium. They were thus bound to produce works in which several different styles are superimposed on one another.... Thus miniature painting in the Crusading Kingdom developed into a very composite art, subject to influences which were the result of local conditions, and which differed with each succeeding generation.... The surprising thing is ... that, in spite of the obvious lack of continuity, something like a local style and a local tradition of unmistakable identity should have emerged at all.[129]

This "local style" and "local tradition of unmistakable identity" is what Buchthal meant by "Crusader art."

Buchthal also has specific observations on Crusader book painting in the thirteenth century:

> It is ... surprising to find that miniature painting in the Crusading Kingdom is much more varied, and of infinitely greater vitality during the thirteenth century than in the twelfth. Its beginnings are entirely traditional: when the scriptorium of the Holy Sepulchre at Jerusalem is revived for a short period during the second quarter of the century, it works on exactly the same lines as before the catastrophe of 1187....[130] The main chapter does not start before the middle of the century: the new impetus derives from the presence in the Holy Land, from 1250 to 1254, of St. Louis and the French court. The scriptorium of Acre has at first sight very little in common with its predecessor at Jerusalem. The western elements are much stronger than ever before; they are predominantly French, and assert themselves not only in the style and iconography of the miniatures and initials, but also in the choice of the texts selected for illustration.[131]

What irony there is in Buchthal's interpretation in which, far from starting out as a French-inspired production, Crusader manuscript illumination reaches its most productive phase at the end of its existence when Western, especially French, aspects assert themselves most strongly. Would that de Vogüé and Enlart could have known this!

Weitzmann also discussed Crusader painting shortly thereafter, in two pioneering articles on Crusader icons.[132] In these two publications Weitzmann presented forty-three images from a total of twenty-six newly attributed Crusader icons on Sinai, combined with two model books and two other icons, one on Cyprus and one now in Grottaferrata, which he called possibly Crusader. In the earlier 1963 article Weitzmann compared a crucifixion image in one of the Acre manuscripts published by Buchthal to a crucifixion on an iconostasis beam from the selection of icons at St. Catherine's Monastery on Mount Sinai he was presenting. He concluded with an important formulation of the artistic phenomenon that also built on Buchthal's earlier comments:

> Attempts to distinguish the nationalities of the icon painters may not always be successful, simply because Italian and French artists working side by side and apparently having models from both countries available, gradually developed a style and iconography which, when fused with Byzantine elements, resulted in what one might simply call Crusader art.[133]

Thus Buchthal and Weitzmann effectively first conceived or coined the terms "Crusader manuscript illumination" and "Crusader art" in the publications just mentioned. It is significant to note that these innovations hinged on the study of painting, a medium heretofore little associated with the Crusaders in the thirteenth century. Furthermore, most of the painting discussed – two-thirds of the manuscripts and twenty-three of the twenty-six icons – was attributed to the thirteenth century. It is not too strong to say that this new material revolutionized the study of Crusader art and the publications by these two scholars marked the turning point to what we might describe as the current state of the question.

Along with the introduction, analysis, and interpretation of these new works of Crusader painting, these two authors noted that a comprehensive assessment of Crusader painting had yet to be attempted. They expressed the expectation that more material could well exist and remained to be identified and evaluated. They also raised important problems that needed to be explored. Buchthal wondered about the larger relationship between Crusader and Muslim art while noting the presence of Muslim influence in thirteenth-century Crusader book painting. He also commented on the issue of the influence of Crusader manuscript illumination on the West. Noting that thirteenth-century book painting in the Crusader Kingdom did not find as strong and enthusiastic a response in Europe as vice versa, he suggested certain reasons to explain this. First is the general decline of interest and what he calls the growing apathy of Latin Christendom for the fate of Syria-Palestine. Second is his claim that Westerners now had "the beginnings of a more mature appreciation of the humanist message of Byzantine art ... and this message could now be learned more profitably from a study of Greek metropolitan works: no provincial Latin clearing-house was needed to transmit it."[134]

Finally, he thinks that the three greatest Crusader manuscript painters of the thirteenth century were not representative of the mainstream of Western painting: "they did not help to prepare the way for the achievements which towards the end of the century became the turning-point in the history of European art."[135] These are important points that will each need to be reevaluated. Yet despite his surprisingly strongly provincial view of Crusader art, Buchthal also had a remarkably strongly positive statement to make about the achievement of Crusader book painting. Speaking of the three main masters referred to above, he says:

> Their achievement must be judged not so much for the dissemination of ideas fertile for the future as for a sensitive comprehension of the cultural and human potentialities presented by the Latin East. To this the manuscripts from Acre added a reflection of its wealth and vitality, and mirrored, too, a multi-racial society whose character, at the same time cosmopolitan and super-national, was so far ahead of its time. This art was far more deeply rooted in the country and in the atmosphere to which it belonged than that of the masters of the twelfth century, but it was not destined to survive the noble cause which it had served.[136]

It is evident that Crusader manuscript painting and Crusader icon painting developed parallel to each other to some extent and were very closely linked, the latter a phenomenon that Weitzmann discovered and explored with convincing results. It is also evident, however, that Crusader icon painting is preserved only fragmentarily. Weitzmann himself points out that St. Catherine's was on the geographical margin of the Crusader Kingdom and that the greater number of icons produced for the Crusaders must have been intended for the churches of the Crusader States in Syria-Palestine. Obviously most of this material now must have perished, but some of it may have been taken to Cyprus or even to the West, as was done with the manuscripts. Weitzmann hopes that seen in this light, new panel paintings from the Crusader East may be identified in the West.

Kurt Weitzmann for his part also proposed the following about Crusader artists:

> One of the conclusions to be drawn from our study of the Crusader icons is that a considerable number of painters – many of them highly qualified – were attracted to the Latin Kingdom of Jerusalem, and later to Acre, from various parts of Europe, and that workshops were established which became exceedingly prosperous. The close relation of icon painting to miniature painting suggests that these workshops were in intimate contact with the scriptoria of Jerusalem and Acre; indeed, there may have been collaboration even to the extent that some of the artists produced miniatures as well as icons.[137]

The work of Buchthal and Weitzmann followed by others has shown that art flourished in the Crusader States on mainland Syria-Palestine, especially in the period from 1250 to 1291. This is clearly a problem to understand in light of the political, military, and economic decline of the Crusaders in Syria-Palestine in these years. However,

> Even more important than the problem of the proliferation of this Crusader art is that of the impact it must have had on the Latin West. The thirteenth century is a period of intense influence of Byzantine style on almost every country of Europe. Only an astonishingly small number of original Byzantine manuscripts and icons of the thirteenth century has been found on Latin soil, and even granting that some may have perished, we have good reason to doubt that their number ever could have been very great.[138]

In light of this puzzling situation, the understanding of which has not changed in the interim, Weitzmann makes several suggestions. One is that in some way or other, what he calls "the sizeable group of Crusader artists" played an important intermediary role bringing knowledge of Byzantine artistic forms to the West. We may ask in regard to this proposal, if what these artists were bringing back to the West was not in fact knowledge of Crusader art, in which byzantinizing forms were imbedded to some extent?

Another suggestion he makes is that one of the means for transmission of byzantinizing forms was through model books, such as the Freiburg leaf and the Wolfenbüttel sketchbook. Other possible means were through sketches of icons in manuscripts or even the importation of actual icons, such as the Virgin and Child at Grottaferrata or the head of an archangel on Cyprus.[139]

There can be no doubt that the basis of our picture of thirteenth-century Crusader painting – and many of its important details – in terms of its nature, chronology, and development, relatively slim though it is, is primarily due to the contributions of Buchthal and Weitzmann. In the period from 1187 to 1244, until Hugo Buchthal attributed a psalter in the Biblioteca Riccardiana in Florence and three service books now in Naples and London to the period between the Third Crusade and the loss of Jerusalem to the Khwarismian Turks, little figural artwork was identified to have been produced in the Latin Kingdom beyond the coinage and what may have been done to decorate the mainly defensive architecture of castles and fortified towns. In the period from the 1244 to 1291, the most dramatic contributions to our knowledge of Crusader art in the Latin Kingdom of Jerusalem have been made since 1957 with three phenomena. First, we have the identification of an important corpus of manuscripts attributed to Crusader Acre.[140] Second, we have the identification of an important corpus of panel paintings in the form of icons now in the Monastery of St. Catherine's on Mount Sinai.[141] They are seen to have Western influence such as Latin inscriptions or Western iconography and are attributed as Crusader icons; their painters are associated in some cases with the school of Acre, although many of the panels seem to have been painted at St. Catherine's. Third – an entirely new contribution – the production of art associated with Louis IX, the king of France, in Paris has been directly linked with the revival of Crusader painting in St. Jean d'Acre.[142]

Overall this figural art is interpreted as having been sponsored by the Church, by Crusader lords,[143] by members of the military orders, and by educated members of the aristocracy, the bourgeoisie, and the merchant class. The production of the art was carried on after Louis's departure partly by homegrown Crusader artists trained or even born in the Holy Land, partly by French or Italian Crusader artists who came from Paris, or Tuscany or Sicily, partly by Eastern Christian atists who worked for the Crusader patrons.

VIII

It is a fact that in the figural arts knowledge of Crusader art in the thirteenth century has been changed most dramatically since 1957 by the publications of manuscript illumination and icon painting referred to earlier. As far as the study of thirteenth-century Crusader architecture and the material culture associated with architecture is concerned after World War II, however, it is the archaeological studies conducted since about 1970 that have contributed most to expanding our knowledge in this area, especially in the territory of the Latin Kingdom of Jerusalem.[144] For these studies there have been numerous contributors at different sites, but the most important scholars who have focused their work on Crusader material have been the following. In 1970 M. Benveniste published a book that surveyed for the first time the full range of archaeological sites in the Crusader Kingdom.[145] He was followed by R. D. Pringle, who published extensively in the 1980s and 1990s. More recently since the 1990s, Crusader archaeology has been practiced by A. Boas, R. Ellenblum, and B. Porée, among others. Not only have they provided important work on individual sites or special problems, but they also have introduced large areas of archaeological research into Crusader studies.[146]

Archaeology has been conducted in castles and towers, towns, rural settlements, and on religious sites and buildings from the Crusader period, and much new information has been forthcoming in regard to thirteenth-century developments.[147] The role of castles in thirteenth-century warfare has been studied by C. Marshall in a useful book that to some extent takes account of what archaeological findings there are.[148] Nonetheless, the stratigraphical excavation of Crusader castles and their study has been focussed largely on twelfth-century examples,[149] although there have been some valuable recent publications on thirteenth-century castles. R. D. Pringle published (1985) a reappraisal of the thirteenth-century castle of Safed (Saphet) and its Mamluk successor, stimulated by the new edition of the thirteenth-century text describing the construction.[150] Pringle has also (1986) reexamined the great hall at Montfort, first excavated in the 1920s.[151] The Templar castle of Chastel Pelerin at ‘Athlit was built in 1217–18, but the town outside is later, probably dating to 1225–50. ‘Atlit was partially excavated during the British Mandate by C. N. Johns, one of the few castle sites seriously investigated archaeologically to any degree. R. D. Pringle has now edited Johns's publications of the excavations from the 1930s along with a revised version of his guide to Pilgrims' Castle.[152] The original 1947 edition of the guide was mostly lost in transit from Oxford to the Near East at the time that hostilities broke out following the announcement of the United Nations partition plan for Palestine. A revision was prepared in 1950 but never published for lack of funds, so the new edition published in 1997 is most welcome. Other material left unstudied from these excavations has also been published separately with valuable results, such as some of the pottery from the castle and fortified town of ‘Athlit.[153]

> One of the most important recent developments in the study of Crusader castles has been the discovery of the extent of Latin settlement in the Latin Kingdom of Jerusalem. In many cases the buildings of these colonists were modest and have either vanished completely or left undistinguished remains which have attracted little attention. A study of Crusader castles which concentrates only on spectacular structures like Crac des Chevaliers and Margat, however, would give a very misleading impression of the nature and variety of Crusader military architecture.[154]

R. D. Pringle has identified more than seventy-five such towers, and there were most likely more. The best recent study of such a tower, its variegated history in the twelfth and thirteenth centuries, and finds from its excavation is *The Red Tower*, by R. D. Pringle.[155] These towers were the most frequently found type of fortification utilized by the Crusaders in the twelfth century, and they continued in use in the thirteenth century, although they were often occupied later by one of the military orders, such as the Templars in the Red Tower.[156]

If the archaeology of castles overall has remained little explored, the investigation of towns, mostly fortified, has been much more active since 1967 and has shed important light on thirteenth-century Crusader construction and material culture in Jerusalem, and many of the coastal cities: Acre, Ascalon, Caesarea, and farther north in Tyre, Sidon, Beirut, and Tripoli.[157] Jerusalem was the focus of Crusader attention even in the thirteenth century, of course, despite the fact that the Holy City was out of Crusader hands most of the time. Some excavation work has shown that the walls of the city, rebuilt by Saladin and his successor, were then dismantled by Sultan al-Mu'azzam ‘Isa in 1219–20.[158] When the Crusaders regained access in 1229, repairs were carried out, but the citadel was taken and destroyed in 1239 by al-Nasir Dawud, and in 1244 the city was lost to the Khwarismian Turks and never regained. Inside the city, the excavations at the Temple Mount, just south and southwest of the Haram al-Sharif, have yielded interesting Crusader period finds.[159]

Of greatest interest for the Crusaders in the thirteenth century was Acre, second largest city in the kingdom and de facto capital between 1191 and 1291. Although there is considerable controversy over the placement of the walls of the city on the east side and the dates of the fortified walls that encompassed the Montmusard suburb to the north, recent work is helping to resolve the questions.[160] The single most important contribution to the determination of the placement of the walls and the extent of Acre is by B. Kedar.[161] Inside the city, major work has been going on in the 1990s by the Sterns, among others. Dramatic new finds have been made all over the city: in the Hospitaller complex, near the Templar fortress, and in the Genoese quarter, and their publication has been slowly appearing.[162] The Crusader port has been a target of special investigation, and digs just outside the old city walls have also yielded important information and interesting Crusader material.[163]

The southernmost major Crusader coastal city in the Latin Kingdom was Ascalon, the walls of which were destroyed by Saladin in 1191. Richard I rebuilt its walls in 1192, but they were then pulled down again a year later. A portion of the walls was rebuilt eventually when Richard of Cornwall regained the city in 1239, but it was captured by the Mamluks in 1247 and later destroyed by Baybars in 1270. Remains of several churches have been identified, but most of them appear to have been Byzantine.[164] Up the coast, Jaffa was one of the most important ports for pilgrims to Jerusalem despite its small harbor. Richard I also repaired the walls here in 1192, and others such as Frederick II, Patriarch Gerald of Lausanne, and John of Ibelin, with help from Louis IX, worked on the fortifications between 1228 and 1253. Baybars also destroyed these walls in 1268 when he took the city. Archaeological probes have not succeeded in finding anything here save part of the seawall on the southwest side of the city. Locations of most churches have been made on the basis of documentary sources.[165]

Farther north on the coast, the medieval town of Arsuf has been excavated in a series of campaigns, principally during the 1980s.[166] The important site of Caesarea was yet another fortified city whose walls were destroyed in 1191 after being captured by Saladin in 1187. The Crusaders reoccupied the city in 1206, and King John of Brienne with the help of Leopold of Austria and the Hospitallers began the project of refortifying the walls in 1217, before an attack by al-Mu'azzam 'Isa interrupted that campaign.[167] Work was resumed in 1228 with the help of German Crusaders, but was only completed with the advent of Louis IX in 1251–2. When Baybars captured the city in 1265, its walls were partly demolished. Excavations have been underway in Caesarea in recent years with various published results on the walls, the thirteenth-century cemetery, the port, and material finds.[168]

North of Acre, there were three major fortified coastal cities in the Latin Kingdom. Tyre was the most important and the only one held continuously by the Crusaders from 1187 until 1289. It was located on an island connected to the mainland by a manmade causeway. The city was protected by major walls with a number of towers on the seaward and landward sides, and it had two heavily fortified gates. The fortifications were damaged by earthquake in 1170, but the city was spared conquest by Saladin by the arrival of Conrad of Montferrat in 1187. Even though the walls were still in a partial state of disrepair in 1202 and were not fully repaired until later in the thirteenth century, Burchard of Mount Sion reports them as completely rebuilt in 1283. Despite the importance of Tyre for the Crusader Kingdom, relatively little archaeological work focused on that period has been conducted there in recent times except for the excavation of the Church of St. Thomas and the recent new find of another church with all its graffiti.[169]

Between Tyre and Beirut, Sidon – like Beirut – was regained by the Crusaders in 1197 and held until 1291. Most of Sidon's land-wall defences were destroyed by Saladin in 1191, and it is unclear when and how they were rebuilt in conjunction with the land castle.[170] No doubt much work was done when Louis IX was here (1253–4), but two gates of the city existed in 1228. The famous sea castle at Sidon was apparently built in three phases starting in 1227 with the German Crusaders, followed by Louis IX in 1253 and the Templars in 1278.[171] Beirut was also in Crusader control most of the thirteenth century, except for Muslim occupation between 1187 and 1197. John of Ibelin refortified the walls in 1205. As at Sidon, a survey of Beirut's land-wall defenses was carried out in the 1920s during the French Mandate.[172]

In the County of Tripoli, the two main coastal cities were Gibelet (Jbail) and Tripoli itself. Gibelet was conquered by Saladin in 1187, who took down its defenses and returned to Crusader control only in 1197 when the castle was apparently rebuilt along original lines.[173] The castle of Tripoli did not succumb to Saladin in 1187, however, and remained continuously in Crusader hands longer than any other fortification in the Crusader States, falling to the Mamluks only in 1289.[174] Recent archaeological work in Tripoli has focused on the castle in the twelfth century.[175]

Finally, in the principality of Antioch the archaeological investigation has also been limited. The fortified town of Tortosa has been the subject of a recent historical study, with archaeological material.[176] Although neither Crac des Chevaliers nor Margat (Marqab) Castles have had major studies since the work of Paul Deschamps, the fresco painting in these two castles has been the subject of a recent study.[177] Farther north, no recent excavations have been undertaken in Antioch itself, but the pottery discovered in the pre–World War II excavations at Al-Mina have been included in recent studies on Crusader ceramics.[178]

Besides the architecture, important studies have also been made on the Crusader material culture, such as pottery and glass. R. D. Pringle, A. J. Boas, and B. Porée have been active in this area, but they are by no means the only scholars working on pottery from the Crusader period.[179] Edna Stern and others have recently been working on the huge amount of material discovered at Acre.[180]

In sum, in terms of new information and new material, it is evident that archaeological studies of the Crusaders in the Holy Land have made a substantial contribution to our understanding of the Latin Kingdom in the thirteenth century. With regard to the architecture of castle, city, and church, the pottery, the glass, and the coins, there is much new material from recent work that can help inform us about Crusader art and developments in the art of the Crusaders between 1187 and 1291.

IX

The third important historiographic development in the study of the art of the Crusaders in the Holy Land since the 1950s is the challenges that have been voiced to the concept of "Crusader art." I have more to say about this in the concluding chapter, but here we can identify some of the main protagonists. The late Otto Demus began the debate in an important review of volume 4 of *A History of the Crusades*, when he stated that "it is . . . questionable whether this label [Crusader art] should be used at all for the sum total of the art that originated in the Crusader territories. . . . Some branches may be legitimately designated in this way, especially miniature and icon painting . . . but others do not seem to qualify for such a definition. There is, for instance, hardly such a thing as 'Crusader Sculpture,' the few surviving works being stylistically so heterogeneous that they cannot be brought under a common heading."[181] Since Demus issued this challenge, I have attempted to argue, in a monograph devoted specifically to the Nazareth Capitals, as well as in Volume 1 of this study, that Crusader art can indeed be usefully seen to include sculpture, architecture, metalwork, coins, silk embroidery, ivory carving, as well as monumental painting, manuscript illumination, and panel painting.[182] It remains to be seen, however, how the criteria identified as characterizing Crusader art in the twelfth century can be applied to the art of the Crusaders in the thirteenth century.

At the same time that Demus was writing, Hans Belting was also mounting a serious challenge to the idea of Crusader art from a different point of view. In 1978 we find his approach in an article he published on thirteenth-century German manuscript illumination in Saxony and its sources in Byzantine-influenced model books titled, "Zwischen Gotik und Byzanz."[183] Here Belting introduces the idea of a "lingua franca" in art. This means that he is proposing the existence of works of art in which painters working in the Mediterranean region integrated fully understood Byzantine principles with certain western European characteristics so seamlessly that we cannot discern the artist's place of origin. It is in effect an artistic lingua franca on the linguistic model.

Belting enlarged on his characterization of the artistic lingua franca in his papers for the session on "Near East and West in 13th Century Art" in the Acts of the 24th International Congress of the History of Art held in Bologna in 1979.[184] He proposed that certain thirteenth-century works exemplified an art neither Western nor Byzantine, but which developed a new synthetic language of components difficult to distinguish. He insisted this art could only be identified in terms of specific works, which embodied an East-West synthesis in the particular historical circumstances of the Mediterranean in the thirteenth century after 1204. This art, in his view, was distinct from the old notion of the Italian *maniera greca* which was a general concept derived from Vasari in the sixteenth century and lacking specificity. By contrast, the art of the lingua franca was very specific and could also be called "l'art du commonwealth mediterranéen de Venise."[185] Finally, Belting made the following assertion: "Il faudrait reserver l'expression 'Art-Croisé' pour le 12e siècle. Son existence ne participe à la compréhension de l'art occidental qu'au niveau des idées et des programmes, et non à celui des formes et des techniques."[186] Belting's view immediately raises certain questions:

1. What is the relationship of Belting's idea of the lingua franca in art to Weitzmann's notion of Crusader art?
2. What are the implications and uses of Belting's analysis and formulation of the artistic lingua franca for the study of Crusader art?

We propose to discuss these questions in the course of our inquiry into the nature and development of Crusader art in the thirteenth century.

Belting's idea that Crusader art was limited to the twelfth century was reinforced by the independent views of another scholar. Also in 1979 Marie-Luise Bulst proposed some very different views on the nature of Crusader art.[187] In her study of the mosaic decoration in the Church of the Holy Sepulchre in Jerusalem she states forthrightly that, in her opinion, Crusader art is better and more correctly characterized as the "art of the Frankish colonialists in the Kingdom of Jerusalem." In particular she points out that it was not the Crusaders, that is, the actual *crucesignati* who came as soldiers or pilgrims (or both), who built, painted, or sculpted the works we call Crusader art. It was mainly the resident Franks and the Italians from Genoa, Pisa, and Venice, that is, the settlers. They were western Europeans who came and stayed, some to intermarry, and their children, who generated the art either as patrons or even as the artists. Furthermore, she asserts, the Kingdom of Jerusalem remained a Western colony, and this colonial outlook characterized Crusader art.

We should remark at the outset that in contrast to Weitzmann or Belting, Bulst was focusing her attention on art of the Crusaders in the twelfth as opposed to the thirteenth century. Thus we refer the reader to our discussion of her issues in the conclusion of our book on the art of the Crusaders in the twelfth century.[188] In this volume I apply her criteria to the thirteenth-century art under consideration and consider the results. Nonetheless, she renders a signal service in drawing attention, first to the importance of patronage in defining Crusader art and second by focusing on those patrons as mainly the resident Franks, the settlers, as distinct from those marked with the cross who came and went on Crusade. The issue of Crusader art as a colonial art is a more difficult issue. I have commented on the problem of interpreting Crusader art in the twelfth century as a colonial art in the first volume of this study.[189] In this volume, it will be evident that the nature and development of Crusader art is different in the thirteenth century, that the relationship of art in the Latin Kingdom with that of western Europe is altered, and we shall have to reconsider this issue with these important changes in view.

Along with this proposal to rename and reconceptualize Crusader art by M. L. Bulst, other questions have been voiced à propos of painting and especially with regard to certain icons. The fundamental issue here is, what works of painting belong to the corpus of Crusader art? In 1986, for example, the late Doula Mouriki published a major monograph, "Thirteenth-Century Icon Painting in Cyprus."[190] Related to the important examples of Cypriot icons she discussed are several that Weitzmann first published as Crusader from Acre in the period *c.*1250–*c.*1280, in particular, two closely related icons with mounted soldiers: St. Sergios with a kneeling female figure, and a bilateral icon with Sts. Sergios and Bacchos on one side and the Virgin Hodegetria on the other.

Mouriki deals cautiously with these icons pointing out their Cypriot and Syrian characteristics and concludes that they were probably done by a Cypriot artist of Syrian background on Sinai.[191] Meanwhile, Lucy-Anne Hunt has recently argued that these two icons were probably done by a Syrian Orthodox painter in the County of Tripoli, comparing them to wall paintings at Qara and in the region of Qalamoun, probably before 1271 when Crac des Chevaliers fell to Baybars.[192] At this point in the unresolved debate, Mouriki's and Hunt's arguments are more persuasive than Weitzmann's idea that they were done by a South Italian artist or that they were done on Cyprus itself as George Soteriou had originally proposed.[193]

Mouriki's and Hunt's discussion of these icons brings out two important points. In the case of the icons with the mounted soldier saints, it is clear that despite the integration of East and West that these works exemplify, and the iconographic features that identify these panels with Crusader patrons, they are still problematic in regard to their place of origin – Sinai, Cyprus, Acre, Tripoli, or somewhere else? Furthermore, the origins and background of the artist who did them is not yet clear – South Italian, Venetian, Cypriot, Syrian, Greek, or Frankish? Nonetheless, these icons are in my opinion no less Crusader because of these difficulties, as I argue later.

The most recent scholar to take up the issue of defining Crusader art, Bianca Kühnel, is again primarily interested in the art of the Crusaders in the twelfth century, but she has an important observation relevant here:

> an over-intensive dealing with problems of identity distracts attention from what should be the major goal of any study trying to outline a school of art, namely the definition of its profile and character. The obstinate hunt for the ethnic identity of anonymous artists and the emphasis on historical and religious circumstances that could be seen to testify to indigenous artistic activity, mean bringing the background into focus and leaving the monuments in shadow.[194]

She continues:

> It seems to me more correct to baptize the various ingredients of Crusader art with names reflecting their respective appurtenances, which can be documented, and seek the local character of Crusader art in its local roots and not in hypothetical attributions to putative locally-bred artists of an unbroken tradition. As we have seen, "local" does not necessarily and exclusively mean local artists, but mainly local past, local interests, local beliefs. This definition of the local character of Crusader art may be much more productive than the search for lost identities or indirect, written proofs of artistic activities.[195]

Her call to return to the analysis of the artistic works and to the importance of their local features for defining Crusader art is important. Heeding her words in dealing with thirteenth-century Crusader art, I certainly give primacy to the monuments themselves and make every effort here to analyze and understand the local character of the works. The problem will be that the roles of unnamed patrons and artists for many paintings will constantly challenge us to evaluate their part in the process of art production as a means of comprehending the uniquely multicultural nature of Crusader art, in terms of function, meaning, and content. We must find ways to respond to these challenges.

At the end of her study "Thirteenth-Century Icon Painting on Cyprus," Mouriki made the following cautionary comment: "We may wonder if Crusader painting, according to the traditional definition, is a less substantial reality than has been assumed."[196]

Recently Robin Cormack has also discussed the limitations of the "traditional definition" in seeking new and fruitful approaches to this art: "the present stage of research has reached an impasse. It can be suggested that this is because the argument has so far been pursued in art historical terms with a strong emphasis on style and iconography. An alternative approach must be to ask whether technical considerations might be able to offer the possibility of progress over the nature of production of some of these paintings.... This will allow the more precise and refined assessment of the category 'the art of the Crusaders.'"[197]

As we shall see, there is no doubt that our understanding of Crusader painting has benefited from greater scrutiny, more careful and knowledgeable analysis, and more sophisticated interpretation. But the fact is that the idea of Crusader art will not be any less valid as a concept even though its definition can and must be critically reconsidered and evolve as studies move ahead. Cormack is surely correct to call our attention to issues of technique, but there are important aspects of style and iconography that require reevaluation and reinterpretation. Seen in this new light the substantial reality of Crusader art will not diminish, even as the criteria for works to be included in the corpus are refined and adjusted with regard to developments in the thirteenth century.

In sum, these challenges to the idea and the corpus of Crusader art and the ensuing discourse, demonstrate that the study of the art of the Crusaders in general, and specifically the thirteenth-century art, is currently very active. Clearly in the course of all future historical inquiry, we must continually attempt to define more precisely what Crusader art is in the thirteenth century, and which works belong to the corpus. Having introduced the views of these scholars and some of the issues they have raised, we shall see what their arguments look like after I discuss the works of art in Chapters 2 through 8 and when we consider the problem, "What is Crusader art?" in the concluding Chapter 9.

X

The views surveyed above constitute some of the most significant statements about thirteenth-century Crusader art and contributions toward its study since 1860, by major scholars who have fundamentally shaped the way we see this art today. It is significant that the understanding of Crusader art is so different at the start of the twenty-first century compared with what it seemed to be at the end of the nineteenth.[198] It is clear that much progress has been made in the efforts to identify and characterize the art of the Crusaders over the past century and a half. The current state of the question challenges us to better comprehend what Crusader art there was in the thirteenth century, how it developed, and how it was interrelated with work done in the Crusader States as well as with other art from the Near East, both Christian and Muslim, and with art from western Europe.

Our study of the art of the Crusaders in the Holy Land during the period 1187 to 1291 is a fresh attempt to discover, analyze, interpret, and characterize the nature and development of this art and architecture in a particularly troubled historical setting. In approaching this study we must recognize that the political, military, and ecclesiastical situation and the economic and social circumstances of the Crusader States in Syria-Palestine differed fundamentally after 1187 compared with what they had been before Hattin and Saladin's conquest. In response to the loss of Jerusalem and the precarious state of Crusader holdings, the number of Crusade expeditions increases sharply in this period. There were seven major Crusades to the Frankish East after 1187: in 1190–2, 1202–4, 1217–1, 1228–9, 1239–41, 1248–50, and 1270–2, compared with only two before 1187. Despite these military efforts, however, the land controlled by the Crusaders is sharply reduced and diminishes steadily in the later years of the century; not only that, the very walls of Jerusalem are dismantled. Most significant perhaps is the fact that after 1187, the Crusaders never regain complete control of the main holy sites that formed such a focus for Crusade ideals and artistic production in the twelfth century. In fact the Crusaders are reduced to the expedient of negotiating treaties and truces with the Muslims, to arrange access to the holy places and to try to control the Muslim military threat.

The Crusader artistic production in these circumstances was fundamentally different from that in the years before 1187. No longer could Jerusalem, Bethlehem, and Nazareth provide the stimulus for art sponsored by the main institutions of and in the kingdom or by pilgrims, travelers, and merchants. The new locations of Crusader artistic production were mostly fortified port cities along the coast, such as St. Jean d'Acre, Tyre, Tripoli, Ascalon, Jaffa, Caesarea, Beirut, Sidon, and Tortosa; major castles, such as Crac des Chevaliers, Margat, Belfort, Safita, Chastel Pelerin, Montfort, Belvoir, and Safed; and a few inland cities and towns, the most important of which was Antioch. As we understand it today, pilgrimage, which had flourished in the twelfth century, was still popular, but diminished in numbers in the thirteenth. In the Crusader East, not only were the main holy places mostly under Muslim control, but also other newly important holy sites, like the Monastery of St. Catherine's in the Sinai wilderness were distant and difficult of access. The role of the pilgrim as patron is still important, but very different in the thirteenth century.

Overall, important aspects of the picture we have of Crusader artistic production in the Crusader States of Jerusalem, Tripoli, and Antioch seem fragmentary and unclear. Many important questions must be answered as we pursue our inquiry. In architecture, we know that major church building was sharply reduced and that castle construction and the repair of fortifications was of necessity given the highest priority in building. We also know that the minting of coinage continued more or less unabated in the surviving holdings. Placed in this context, however, can it really be that the overwhelming majority of Crusader painting is to be found in the period from 1250 to 1291? Can it be that there really is so little figural sculpture and metalwork? Is the only more or less constant architectural or artistic activity the seemingly unceasing repair and rebuilding of city and castle fortifications?

To begin with, we must recognize important changes in the historical circumstances in which Crusader art was produced. First, one of our major problems is, of course, the Fourth Crusade. Given the huge amount of booty that the Fourth Crusaders captured in Constantinople and sent back to Europe, suddenly the Holy Land is eclipsed from view as a source or center of artistic production. How can we raise this veil, so to speak, and look beyond the riches of Byzantium to see what was going on in Syria-Palestine, even if production may have been reduced? Second, we must assess Crusader artistic activity in the holy places during periods of Muslim control and during the time access was arranged by truce and treaty. Scholars have differed over what went on at these times. How were the holy sites liturgically and physically maintained, to what extent were repairs possible to important churches and to their decorations, was there any new construction, and could pilgrims continue to find souvenirs in the form of metalwork and painting to take home with them? Third, there is the change in military strategy for Crusade expeditions to the Holy Land. Did the shift to attack Egypt first sharply diminish resources in the Crusader States? How did this affect the production of Crusader art in the Holy Land?

Clearly the position of the Latin Kingdom, the County of Tripoli, and the Principality of Antioch in the eastern Mediterranean was dramatically different after 1187, and especially after the Third and Fourth Crusades. Instead of the Frankish presence in the Levant being entirely focused on the coast of Syria-Palestine, now there were other major Frankish holdings: on Cyprus after 1191, in Constantinople, and in Frankish Greece after 1204. These new holdings changed the strategy for conducting Crusades in the East; now Cyprus increasingly became a staging ground for targeting the center of Muslim power in Egypt en route to the Holy Land, rather than direct assaults on the Muslims in Jerusalem as we saw with the First Crusade. The Latin Empire and Constantinople was a tempting alternative to the Holy Land for Western attention – for ecclesiastical interests, economic interests, and military interests. These new Frankish centers also produced works of art and part of our challenge is to understand what that art was and how it related to the art of the Crusaders in Syria-Palestine. It is well known that both Cyprus and Constantinople had strong ties to the Latin Kingdom of Jerusalem in this period, and that there were close artistic ties. But our knowledge of these artistic developments is severely limited and we need to know much more.

Indications are that, compared with the twelfth century, much more Western art was imported into the Crusader States between 1191 and 1291. We need to investigate this phenomenon. Does the appearance of Western enamels, metalwork, and textiles mean that such objects are being sent to the East from centers in the West, or does it mean that artists from the West are coming to the Crusader East and setting themselves up to produce such art in places such as Acre, Tyre, Tripoli, and Antioch? We know that at least one manuscript painter came from Paris and set up shop in Acre in the 1280s. What does this indicate about artists, the art market, patrons, and productivity in the thirteenth century in the Crusader States? To what extent is the increased dependence on the West seen in military, ecclesiastical, and economic terms in this period also a feature of the artistic production? How can we explain the outpouring of "Crusader icons" between *c.*1250 and 1291 under these circumstances? Is it not odd that apparently this period of major patronage for "Crusader icons" occurs just when access to the three main holy sites is being sharply constricted and then cut off? Or could it be that this is part of the explanation for why we find so many icons in the second half of the century? Does Sinai provide one important alternative for the increasingly inaccessible major holy sites, and are the Crusader icons we find there now mostly done as gifts for this special holy place?

Finally, in looking at the current state of the question about the art of the Crusaders in the Holy Land during the thirteenth century, a number of important and basic problems present themselves. What function(s) did each work of Crusader art serve? Who were the patrons for Crusader art: if, as Buchthal argues, the majority of the luxury books were done for patrons in the royal court, what role did ecclesiastical officials play, not to mention educated soldiers both secular and religious, such as the major figures in the chief military orders, namely the Hospitallers, the Templars, and the Teutonic Knights, and private pilgrims? Did the leaders of each one of the numerous major expeditions to the East after 1187 have a role to play in the sponsorship of works of art? If, as Weitzmann suggests, church officials and Templars were major sponsors for the icons and panel paintings, who else can be identified as important sponsors? What role did the Italian merchants, aristocratic and religious women, Hospitallers and Teutonic Knights, members of the bourgeoisie, and private pilgrims play?

Ultimately, we hope to answer the basic question, what is Crusader art in the thirteenth century in Syria-Palestine? In formulating our discussion we propose to move ahead, based on the following propositions: First, Crusader art in the thirteenth century is distinct from that of the twelfth century. Second, Crusader art in Syria-Palestine is different from Crusader art on Cyprus or in Constantinople and in Frankish Greece. Third, Crusader art in Syria-Palestine is distinct from the art of Eastern Christians in the Near East. Fourth, Crusader art has a special role to play in the Mediterranean world in relation to Byzantine art, Armenian art, Italian art of the *maniera greca*, French and German art, and Muslim art. In addition to the solid basis of scholarship discussed in this chapter, many current scholars have made substantial and important contributions that have shaped our approach to the study of Crusader art in the thirteenth century. These contributions are found both within the area of Crusader studies, in both history and art history, and outside, mainly in the fields of Byzantine art and archaeology, East-West studies in the Mediterranean world during the medieval period, and studies in Muslim medieval art and history.

In pursuing our goal of studying the art of the Crusaders in the Holy Land during the thirteenth century, we must deal with what is an elusive and difficult subject, much more problematic in certain ways than Crusader art in the twelfth century. Whatever the problems, however, my approach is clear and should not be in doubt. In this inquiry I am dealing with the history of Crusader art as history. Drawing on the inherently interdisciplinary nature of the history of medieval art, I am focusing on the problems of studying the works of art and architecture in terms of understanding and constructing their patronage, their production and technique, their artists and architects, their functions, their style and meaning, and their immediate historical context through visual and written evidence of the period. Approached in this manner, I endeavor to balance the concrete documentation with a certain minimum of historical imagination necessary to carry the historical narrative along. Working in the context of the rapidly changing discipline of the history of art since 1995, the new agendas of postcolonial and multicultural studies will prove to be congenial to this endeavor, along with the new-historicist concerns of race, class, and gender, and it will be seen that women's studies, reception, and even performance theory can be relevant and valuable in handling various problems with which this material presents us.

In sum, I wish to examine the art of the Crusaders and show how this art is a distinctive product of the thirteenth-century environment in which it was produced. I want to do this by addressing the art directly, in terms of recognition and interpretation. I also want to do this by addressing certain issues pertaining to the art, which can be briefly restated in conclusion here.

1. Crusader art: what is Crusader art in the thirteenth century in Syria-Palestine, what is distinctively "Crusader" about this art, and how do we identify its main characteristics?
2. Multiculturalism: who were the patrons commissioning the art of the Crusaders in Syria-Palestine, and who were the artists producing it? How did the indigenous artistic traditions that the Crusaders encountered in the Holy Land interact with, combine with, or exert influence on Crusader artists and the art they produced, along with the western European traditions that formed part of their own heritage and the Byzantine art that was an active force in the Crusader and the Eastern Christian artistic worlds? Was there an artistic lingua franca in the thirteenth-century Mediterranean world, just as there was a lingua franca for shipping and international commerce at this time?
3. Religious and secular art: what functions were served in the thirteenth century by religious art and by the new secular art after midcentury in the Crusader States of Syria-Palestine? In religious art, is pilgrimage art still a major component, as it was in the twelfth century, and what explains the new media in thirteenth-century art, especially the appropriation of icons for use in the Latin church? Why does secular art become so important in the Holy Land, and how does this development relate to the rise of secular art in Europe after *c.*1250?
4. Colonialism: despite the postcolonial perspective of current scholarship, the thirteenth-century art of the Crusaders in the Holy Land exhibits some examples that appear to be more colonial than anything identifiable in the twelfth century. Why is this, and how can this art be understood as Crusader, not French colonial?
5. Crusader artistic developments: what distinctive Crusader developments can be seen in art; in the architecture of churches or castles; in the iconography of religious or secular imagery; in the formal design of painting, sculpture, or architecture; in the techniques of the various media; in the creative work of fulfilling the commissions of sophisticated Crusader patrons in a multicultural religious, social, economic, and political context?

In sum, it is astonishing to consider the extensive corpus of Crusader art and architecture that we have to work with today, compared to that with which Enlart worked in the 1920s. Basically, Enlart did not know or consider thirteenth-century Crusader painting in the form of icons or manuscript illumination. Yet more than any other media, these forms of painting have expanded and defined the nature of thirteenth-century Crusader art in our era, the period of 1957 to the present. Will there also be breakthroughs in other media like these, for example, in metalwork, ivory carving, numismatics, sigillography, or textiles? Will current archaeological fieldwork define new examples of Crusader architecture or uncover new and important examples of architectural sculpture, painting, coins, pottery, or glass? To be sure, recent research has offered new insights relevant to Crusader work in most of these areas.[199] Our task, in light of scholarly contributions old and new, is to construct a newly integrated vision of Crusader art for the period from 1187 through the thirteenth century to 1291, a completely revised and newly presented state of the question.

PART ONE

1187–1244

O God, the nations have come into your inheritance; they have defiled your holy temple, they have laid Jerusalem in ruins. . . . We have become the reproach of our neighbors, the scorn and derision of those around us. . . .

O Lord, how long? Will you be angry forever? . . . Remember not against us the iniquities of the past; may your compassion quickly come to us, for we are brought very low. . . .

Help us, O God our savior, because of the glory of your name; deliver us and pardon our sins for your name's sake. . . .

Then we, your people and the sheep of your pasture, will give thanks to you forever; through all generations we will declare your praise.

Psalm 78
Liturgy for the Commemoration of Jerusalem, 1188

SALADIN'S CONQUEST OF JERUSALEM AND THE AFTERMATH

THE ART OF THE CRUSADERS, 1187–1192

THE PRECARIOUS CONDITION OF THE LATIN KINGDOM AND THE CRUSADER STATES IN 1187–1188

Following the catastrophe at Hattin on 4 July 1187, where the greatest Crusader army ever to take the battlefield in the Latin Kingdom was annihilated, where the relic of the True Cross was captured by the Muslims, where the king of Jerusalem and the masters of the Hospitallers and the Templars were captured, Saladin moved directly to conquer and occupy Crusader territory. Between 5 July 1187 and 1 January 1188 he managed to take every major Crusader city in the Latin Kingdom, except Tyre. In the Principality of Antioch, the Crusaders managed to hold Antioch and the castle of Margat; in the County of Tripoli, they held only Tripoli and Tortosa, and the castles of Crac des Chevaliers and Chastel Blanc. But the most serious loss was, of course, the Holy City of Jerusalem.[1] (Map 1)

Saladin had turned his attention to planning an attack on Jerusalem immediately after the battle of Hattin. To ensure success he systematically took the major ports along the coast and as many inland castles and towns as possible. He began by conquering Tiberias on 5 July 1187, Acre on 9 July 1187, and continued by taking Beirut, Sidon, Jaffa, Ascalon, and Gaza, as well as Gibelet in the County of Tripoli. Inland only the castles of Belvoir, Safed, and Belfort held out, along with Shaubak and Kerak across the Jordan. Among the smaller but important castles that were captured was La Fève, in the Jezreel Valley, west of Belvoir and south of Hattin. The Templar garrison from La Fève had been destroyed at the springs of Cresson on 1 May 1187. Although fully regarrisoned as soon as possible, it could not hold out against Saladin's army after Hattin on 4 July. Shortly after it was taken, the Muslims began the process of dismantling the fortifications. This was an ominous indication of Saladin's policy for captured military sites to come.[2]

The refugees from these places mostly crowded into Tyre or went farther north to Tripoli. On 14 July 1187, the arrival of a strong leader from Europe via Constantinople to Tyre, the Marquis Conrad of Montferrat, made it possible for the Crusaders to organize and defend the city against the Muslims in the face of an extended siege during November and December 1187. Saladin never did succeed in taking Tyre.[3]

Meanwhile Saladin attacked the Holy City in late September. Balian of Ibelin, one of the few who escaped from Hattin, was there, and he along with the Patriarch Heraclius assumed command against the attack. Because the Crusader army had been destroyed at Hattin and many other people had sought refuge in Tyre, there were few defenders, but the population had been swollen by noncombatants seeking safety. The chronicle of Ernoul estimates that there were fifty women and children for every man in the city.[4] Those soldiers who were there had to be paid, however, and the continuation of William of Tyre's chronicle known as the Paris Eracles reports that the Patriarch and Balian had the Holy Sepulchre aedicule stripped of its silver decoration to be melted down and used to strike coins for the defenders.[5]

At first, Saladin attacked from the west side without success. Then he moved his assault to the northern corner of the western walls where his siege engines could operate more effectively against the fortifications. The location of their attack is identified in the *Itinerarium*. "There used to be a stone cross which our knights had once erected on the walls in memory of their victorious capture of this city after their capture of Antioch. Those savages destroyed this with a missile from a catapult, and flattened no small part of the wall with it."[6] It was the same zone along the walls where the First Crusade had entered the city in 1099. Meanwhile prayers were offered, penance was done, the "monks, priests and nuns all went barefoot beneath the walls in a procession with the Holy Cross that belonged to the Syrians carried before them, and the priests carried aloft the Body of Christ."[7] All to no avail.

After only six days of Saladin's main assault, Balian d'Ibelin, the Crusader commander, was forced to come to terms, despite the formidable protective walls. The Orthodox residents of the city were said to be negotiating with Saladin to open the

gates of the city to the Muslims, which may have hastened the surrender.[8] Thus Saladin conquered Jerusalem on 2 October 1187, in circumstances very different from those that had characterized the Crusader victory in 1099. In regard to the aftermath, even the Crusader chronicle of Ernoul reports:

> I shall now tell you how Saladin had the city of Jerusalem protected so that the Saracens would do no harm to the Christians there. He placed two knights and ten serjeants in each street to guard the city, and they guarded it so well that I never heard of any wrong being done to a Christian.[9]

A ransom was arranged for Christians who wished to leave and could pay the individual fee, a capitation tax. Nonetheless the terms were generous:

> The Sultan agreed to give the Franks assurances of safety on the understanding that each man, rich and poor alike, should pay ten *dinar*, children of both sexes two *dinar* and women five *dinar*. All who paid this sum within forty days should go free, and those who had not paid at the end of the time should be enslaved.[10]

Many poor persons were also released under a blanket ransom payment arranged by Balian, but twice as many remained because he could not raise a large enough sum to cover them all; neither the patriarch nor the military orders apparently would contribute. Of the Christians who remained, most were native Syrians or Greek Orthodox who presumably entered the Sultan's service or payed tribute. Among the Franks, ten Hospitallers were allowed to stay for a year to man their hospital; four Syrian priests were also authorized to celebrate the liturgy at the Church of the Holy Sepulchre.

The second of October 1187 was a Friday, and the Muslims deemed it a good omen that Jerusalem fell on their holy day. For the Christians it was the Feast of St. Leger; for the Muslims Imad ad-Din said it was the anniversary of Muhammed's ascension to heaven. When the Muslims entered the Holy City that Friday, one of the first acts they performed was to reclaim Jerusalem for Islam by removing a prominent Christian symbol:

> At the top of the cupola of the Dome of the Rock there was a great gilded cross.... Some of them climbed to the top of the cupola to take down the cross. When they reached the top a great cry went up from the city and from outside the walls, the Muslims crying the *Allah akbar* in their joy, the Franks groaning in consternation and grief. So loud and piercing was the cry that the earth shook.[11]

This was such a momentous and symbolic act that both Muslim and Crusader chroniclers report this deed.[12] Jerusalem, third holiest site in Islam after Mecca and Medina, was back in Muslim hands! Jerusalem, holiest site in Christendom, was lost again to Christianity! Now the Christian laments for the loss of the Holy City begin. It remains to be seen if the loss of Jerusalem was reflected in the contemporary Crusader art.

Bad news traveled fast. Pope Urban III died on 20 October after hearing of the catastrophe at Hattin and possibly first word of the loss of Jerusalem.[13] As the news began to circulate in Rome by the end of October, the newly elected pope, Gregory VIII, immediately issued a call for a new Crusade. In his letter, *Audita tremendi*, dated 3 November, he writes:

> On hearing with what severe and terrible judgement the land of Jerusalem has been smitten by the divine hand,... Saladin came upon those regions with a host of armed men. There advanced against him the king, the bishops, the Templars, the Hospitallers and the barons with the knights and the people of the land and the relic of the Lord's cross,.... They were attacked and, when our side had been overpowered, the Lord's cross was taken, the bishops were slain, the king was captured and almost everyone else was either killed by the sword or seized by hostile hands, so that very few were said to have escaped in flight. The bishops, moreover, and the Templars and the Hospitallers were beheaded in Saladin's sight. We do not think that we ought to describe the events in letters until somebody comes to us from those parts who can explain more fully what really happened: how, once the army had been overcome, the infidels invaded and ravaged everything so that it is said that there are very few places left which have not fallen into their hands.... What a great cause for mourning this ought to be for us and the whole Christian people![14]

Gregory had much detailed information about Hattin, and little about the subsequent fall of Jerusalem because of the time news took to reach Italy.[15] Nonetheless he did not hesitate to send out this letter calling for a new Crusade as one of the first acts of his pontificate. Shortly after this, he also initiated specific liturgical observances for all of Latin Christendom in support of the Crusade: a Lenten fast was ordained for the Fridays in Advent for five years, and a special mass was to be sung on those days. On Wednesdays and Saturdays in Advent, all healthy Christians were also to abstain from eating meat. In addition, special prayers were ordered to be said for the liberation of the Holy Land and for the release of Christian prisoners from Muslim captivity.[16]

In this manner the extremely difficult situation of the Crusaders in the Holy Land was given a striking immediacy and a continuing liturgical presence in western Europe; a more direct link with heightened consciousness was forged between East and West, which was completely different from the calls for Crusades after the fall of Edessa and the Second Crusade failed in the 1140s. It would result in two major expeditions being organized and sent forth between late 1187 and 1204. Both the Third and Fourth Crusades resulted in unparalleled destruction of Christian works of art and architecture. No Muslim was involved in the depradations of the Fourth Crusade on the city of Constantinople in 1204. Saladin was, however, responsible for ordering major devastation on former Crusader holdings during the Third Crusade, and he began his policy of destruction or removal of Crusader work after the conquest of Jerusalem in October 1187.

THE DESTRUCTION AND DISPERSAL OF CRUSADER ART AS THE RESULT OF SALADIN'S CONQUEST OF JERUSALEM IN 1187

Saladin's conquest of most of the cities, towns, castles, and fortified positions in the Latin Kingdom of Jerusalem, and many in the other Crusader States, meant that there were serious losses of artwork and architecture. Some were caused by the "cleansing" ordered by Saladin of Muslim holy sites formerly held by the Crusaders in Jerusalem and other major places.[17] Some were the result of Christian attempts to preserve portable religious works and precious materials by taking them from churches and monasteries. By removing them from public view, or from treasuries or other sanctuaries, the Christians hoped to save these religious objects and treasures and take them to some safe place, either elsewhere in the Crusader States (e.g., to Tyre) or possibly to some major castle on the mainland, to Cyprus, or even to the Latin West. There are also stories of state papers, that is, legal documents being lost, but the details of what specifically happened are lacking. Finally, there was also loss of Crusader art caused by the sale of personal objects and even, in extremis, theft of valuable ecclesiastical objects from churches in the city during the forty-day period Saladin proclaimed for arranging ransom payments. There was also the hiding or burial of works for "safekeeping": some that were recovered by the Crusaders after 1191, some that never were recovered during the Crusader period but were found later, some that were never found.

Cleansing the Holy Sites

The policy of cleansing the Muslim holy sites was an important feature of Saladin's conquest. The continuations of the *History of Outremer* by William of Tyre[18] and the *Itinerarium Peregrinorum* do not discuss this in great detail, but some examples are given. We are told that before Saladin worshipped in the Haram, he literally had the Temple (*le Temple*) cleansed with rose water.[19] In addition to removing the cross on the Dome of the Rock, the Muslims also pulled down the cross on top of the Hospitallers' church opposite the Church of the Holy Sepulcher.[20] Jerusalem was meant to have a new set of symbols on its skyline proclaiming the presence of Islam.

The Muslim sources are, not surprisingly, much more detailed and informative about Saladin's policy, however. Ibn al-Athir reports that Saladin ordered that all Muslim shrines should be restored to their original state. All Templar buildings attached to the Aqsa Mosque were removed, presumably thus wiping out years of recent Crusader construction and decoration.[21] Some important new works of Islamic art were created: in restoring the Aqsa to its former glory, Saladin commissioned a new mihrab adjacent to where the magnificent pulpit or minbar of Nur ad-Din was to be placed in the Aqsa.[22] Fine marble was acquired; golden tesserae from Constantinople and other special materials that Ibn al-Athir says had been kept in storage for years were used. It is not clear whether these materials were Crusader stores that the Muslims took possession of, were newly acquired, or some of each.

The Dome of the Rock was cleansed, and on the Friday following the conquest, 9 October, prayer was celebrated there once again with Saladin attending. Imad ad-Din reports:

> They [the Crusaders] had adorned it with images and statues, set up dwellings there for monks [the Augustinians] and made it the place for the Gospel, which they venerated and exalted to the heights. Over the place of the [prophet's holy] foot they set an ornamented tabernacle with columns of marble, marking it as the place where the Messiah had set his foot; a holy and exalted place, where flocks of animals, among which I saw species of pig, were carved in marble. But the Rock, the object of pilgrimage, was hidden under constructions and submerged in all this sumptuous building. So the Sultan ordered that the veil should be removed, the curtain raised, the concealments taken away, the marble carried off, the stones broken, the structures demolished, the covers broken into.[23]

Thus the Muslims removed the marble slabs that the Crusaders had placed over the rock, along with the iron grill that had surrounded it.[24] When it was uncovered, Saladin had handsome copies of the Qur'an brought for use in worship.[25] Meanwhile the Latin inscriptions in mosaic that had been positioned on the Templum Domini[26] were taken down and new inscriptions from the Qur'an were put in their place.

The evidence for some of these removals is to be seen all over the Haram. There are Crusader figural or foliate sculptures, mostly capitals from the Augustinian Monastery cloister or the Templar compound reused as *spolia* in numerous structures such as the Beautiful Gate (Bab al-Silsila and Bab al-Sakina) into the Haram,[27] the entry to the Qubba Nahwiyya[28] and the later summer pulpit of Qadi Burhan ad-Din on the platform,[29] and the Omariyya mihrab in the Aqsa.[30] Other sculpture is also found piecemeal elsewhere in Jerusalem.[31]

Finally, in visiting the Aqsa and the Dome of the Rock, one is struck that reused Crusader sculpture is found in certain conspicuous and important locations, such as on the dikka, on wall panels, on the capitals for Saladin's mihrab in the mosque,[32] and over the entrance to the well of souls as well as for transenna and arcade panels in the Dome of the Rock,[33] among others. In the case of the dikka, the prayer platform is constructed with a rich variety of Crusader foliate sculpture in the form of capitals, abaci, balustrades, moldings intricately put together to form a large and impressive ensemble. It is particularly surprising to find some of the figural imagery remaining on these reused *spolia*: eagles on Saladin's mihrab capitals;[34] birds, animals, and human heads on the dikka; and human heads on the capitals supporting the tympanum above the entry to the well of souls. These figures are "reconciled to Islam," so to speak, by defacement with chisel strokes, lightly applied in some cases, more heavily in others, but the figures are mostly still visible.

It also appears to be the case that the Qubbat al Mi'raj, which likely served as the baptistery for the Templum Domini, was completely renovated with its original capitals left in place. New marble slabs were used to close in the sides, and an inscription was put up dating the work to 1200–1.[35]

The major campaign to remove the Crusader work and to restore and renovate these monuments therefore must have been taking place in the months and years following the conquest on 2 October 1187, although we can rarely specify precisely when the work was completed except in those cases where an inscription survives.[36] Nonetheless, we know that Saladin set the whole process in motion and can imagine that most of the work was done between 1187 and the 1190s, much of it before he died in 1193 and the rest of it by his son and his nephew.

It is hardly surprising that the major Muslim monuments were reclaimed for Islam by having their Crusader appendages removed, to be replaced in certain cases by newly configured *spolia* that was acceptable to Muslim sensibilities. What is more remarkable perhaps, is that many, if not most Christian churches and their monumental decoration, as far as we know, were left alone. Some churches were, of course, converted to Muslim use. The most important of these monuments, the Church of the Holy Sepulchre, was the object of intense debate on the part of the conquering Muslims.

> The Sultan's household, pious scholars and men of virtue, spoke to him about establishing a *madrasa* for Shafi'ite lawyers and a convent for sufis; he set aside for the use of the *madrasa* the church dedicated to St. John near the Gate of the Tribes, and for the convent the patriarch's house near the Church of the Resurrection. He endowed both liberally, thus benefitting both communities. He also set aside sites for *madrasas* for the various (other) communities. . . .[37] He had the church of the Resurrection closed to Christian visitors even as a refuge. Many discussions were held with him about its fate; some advised him to demolish it and abolish all trace of it, making it impossible to visit, removing its statutes, driving away its errors, extinguishing its lights, destroying its Testaments, eliminating its false allurements, declaring its affirmations to be lies. "When its buildings are destroyed," they said, "and it is razed to the ground, and its sepulchre opened and destroyed, and its fires spent and extinguished, and its traces rubbed out and removed, and its soil ploughed up, and the Church scattered far and wide, then the people will cease to visit it, and the longings of those destined to damnation will no longer turn to seeing it, whereas if it is left standing the pilgrimage will go on without end." But the majority said: "Demolishing and destroying it would serve no purpose, nor would it prevent the infidels from visiting it or prevent their having access to it. For it is not the building as it appears to the eyes but the home of the Cross and the Sepulchre that is the object of worship. The various Christian races would still be making pilgrimages here even if the earth had been dug up and thrown into the sky. And when 'Umar, prince of the believers, conquered Jerusalem in the early days of Islam, he confirmed to the Christians the possession of the place, and did not order them to demolish the building on it."[38]

These arguments are important. Saladin and the moderates won out here, but the more radical view of eradicating evidence of the presence of the Crusaders would grow stronger after 1187. Saladin was not averse to destroying sites of military value as we shall see, but he knew the importance of religious holy places and no doubt remembered what had happened in Jerusalem after the destructive attack of the fanatical Fatimid Caliph al-Hakim on the Holy Sepulchre in 1009. Not only had al-Hakim failed to obliterate the site, but also the church had first been rebuilt by the Byzantines in the 1040s, and the Crusaders had then renovated and expanded this new church in the 1140s.[39] Indeed, by adding a second dome they made the Church of the Holy Sepulcher the only double-domed building in Jerusalem, unique in contrast to the Templum Domini and the Templum Salomonis.

What Saladin did do at the Church of the Holy Sepulcher was to have the doors to the church closed for three days to keep everyone out, a protective measure. Then he apparently ordered that the bells in the campanile be taken down and broken. Furthermore, having decided not to destroy the church, he may have ordered one of the two main doors – the right-hand door – to be walled up. De Sandoli argues that Saladin reasoned there was no need for two large doors because so few Christians would remain in the city.[40] Finally, for the future Saladin imposed a tax on anyone, chiefly Christians of course, who wished to visit the holy sites in the Church of the Holy Sepulcher.[41]

Christian Attempts to Save Works of Art

The religious works that Christian refugees attempted to preserve in their possession varied according to the means of the person. The patriarch of Jerusalem at that time, Heraclius, was obviously one of the major figures. He has not, however, received positive treatment by modern historians for various reasons.[42] For one thing, he is vilified by the author of the continuations of the so-called chronicle of Ernoul. It was Heraclius, for example, who had the True Cross relic taken to Sephoris, where it was given to the bishop of Acre who carried it in the battle of Hattin. Thus the texts of the continuations known as the *Chronique d'Ernoul* claimed that Heraclius fulfilled a prophecy: that the True Cross would be lost, just as it had been brought to Jerusalem, by a man named Heraclius. Heraclius, of course, did not die in the catastrophe at Hattin and lived to lead the Christian resistance to Saladin in Jerusalem with Balian d'Ibelin. Furthermore, he was said to take treasures from the Church of the Holy Sepulcher, from the Templum Domini, and from the Templum Salomonis, along with a very large amount of money.[43] Imad ad-Din says that he stripped the gold plating and the gold and silver artifacts from the Sepulcher, presumably meaning the tomb itself.[44] In fact, he attempted to take away so much that some of Saladin's emirs protested that he should not be allowed to despoil the holy sites. Saladin, however, refused to extract more than the agreed amount, ten *dinars*, for his ransom, and he was allowed to leave with an armed escort to seek refuge in Tyre.[45]

The Question of the Loss of Legal Documents

The question of legal documents being lost is a controversial one. In the middle of the thirteenth century, both John of Ibelin and Philippe of Novara record a story about "Les Letres dou Sepulcre" in their treatises on Crusader legal institutions and the High Court. Philippe of Novara tells us:

> Things could be done much better and settled far more satisfactorily in the Kingdom of Jerusalem before the land was lost [in 1187]. For all the *assises* and good usages and good customs, that is to say any usage of great authority, were written down and kept in the Holy Sepulchre, and people called them the "Letters of the Sepulchre" because each *assise* and usage and custom was written out separately on a large and splendid piece of parchment. And also there were the usages and *assises* relating to the *cour des bourgeois* along with those of the High Court. And each piece of parchment bore the seal and sign manual of the king and the patriarch and also of the viscount of Jerusalem. And they were all written out in large ornate letters, and the initial letters were illuminated in gold and all the rubrics were in red [sic]. . . . And whenever it happened that there was an argument in the court concerning an *assise* or usage, so that it was necessary to see the documents, the chest wherein they were kept could be opened by the hands of nine people. . . . And all this I have heard recounted by many who had seen it before the "Letters" were lost, and from many others who knew all about it, some of whom were those who had charge of the "Letters" at some time. And all was lost when Saladin took Jerusalem, and never again was an *assise*, usage, or custom written down.[46]

This story is revealing and fascinating about what it tells us in regard to perceptions of the great losses in Jerusalem in 1187. It also indicates how the presentation or documentary copy of a legal text could be prepared and decorated, and the role which the Church of the Holy Sepulcher apparently played as state church, seat of the patriarch, and major holy site, in this case serving as the place of safekeeping for these putative documents.

Peter Edbury has taken the position that no such Letters existed from pre-1187.[47] He argues that this story was concocted in the difficult years of Ibelin struggles with pro-Imperial forces during the 1230s and 1240s to buttress the Ibelin legal position in the Latin Kingdom. The main evidence against the existence of these Letters in his opinion is the fact that the story simply makes no sense. He analyzes the contradictory nature of the contents of the story. Furthermore, he points out that if these Letters had been so remarkably valuable and useful before 1187, why had no attempt been made to reconstruct or replace them? Why indeed did other major twelfth-century chroniclers, such as William of Tyre, who as chancellor would have had access to royal archives, never refer to such important documents in their writings?

Despite the strong arguments marshaled against these Letters, the question arises whether there might not have been other legal records, from the royal archive or chancery, perhaps of a less exalted nature, that could have been preserved in some kind of trunk for safekeeping and for transport and were taken to Tyre at this critical moment in 1187. Could this story alert us to the existence of other legal documents with illuminated initials and marginal decorations befitting their importance? Could some of these documents in fact have been made before 1187, have been transferred to Tyre and then to the new capital of Acre, but not have survived the siege of 1291? Another question is whether documents, which resembled the examples referred to in the story, could have been produced in the mid-thirteenth century.[48] The fact is that whereas we do not have any Crusader legal manuscripts extant from the period around 1187 or from the mid-thirteenth century, we do have decorated examples from later in the thirteenth century made in St. Jean d'Acre.[49]

The Loss of Artworks by the Crusaders

Other artistic works were lost by the Crusaders in the process of dealing with the surrender and the arrangements for financing the ransom fee. When Balian d'Ibelin surrendered Jerusalem, we are told the story that he brought the keys to the city, that is, the keys to the main gates, to Saladin and handed them over physically.[50] We know nothing about these keys, when they were made or who made them, but we can wonder whether, when the Crusaders took Jerusalem in 1099, they did not have new locks put on the doors and new keys made by a Christian locksmith in the city. Just as with the lock and key to the main doors of the Church of the Holy Sepulcher today, safeguarded by members of the Muslim Jodeh family and employed to open and lock the doors by the Muslim Nusseibeh family, a lock and key that are presumably nearly two hundred years old in 2004, we can safely assume that a similar, very important set of locks and keys for the doors in the twelfth century would have been carefully guarded by the Crusaders.[51] The keys to the Church of the Holy Sepulcher must have also been handed over to Saladin in 1187, who then apparently reduced the functioning main south doors to one portal.

The Old French continuations say relatively little about the frantic efforts made by individual Christians in the city to find the ransom money in the forty days after 2 October, but Imad ad-Din has a long passage:

> The Franks began selling their possessions and taking their precious things out of safe-keeping to sell them for nothing in the market of abjection. People made bargains with them and bought the goods at very low prices. They sold things worth more than ten *dinar* for less than one and were forced to put together all they could find of their scattered possessions. So they scavenged in their own churches, stripped them of their ornaments and carried off candelabra and vases of gold and silver, gold and silken curtains and draperies. They broke open and emptied the boxes in the churches and took from the storage chests the treasures they contained.[52]

In this way, many works of Crusader art were lost, works such as liturgical vessels made of gold and silver, fine textiles, and other metalwork.

We can get some idea of what kind of things there were to be sold, or stolen and sold, if we look at the later inventories of the Church of St. Peter in Antioch (1209)[53] or the personal inventory of Count Eudes de Nevers in Acre (1266).[54]

In this climate of panic and with Frankish people desperately attempting to find the wherewithal to pay their ransom, we can nonetheless imagine attempts by some farsighted churchmen to secret away church treasures. Presumably there were some Latin priests who were hopeful that the Crusaders would return to Jerusalem, Bethlehem, Nazareth, or other sites. Presumably they may have tried to save some of their church treasures by hiding them, as we are told "holy men" of Jerusalem had hidden the relic of the True Cross before 1099. Or in 1187 there is the case of the reliquary now in the Greek Orthodox patriarchate museum, which may have been hidden before Saladin took the city.[55] There is also the possibility that Crusaders asked trustworthy colleagues to store such treasures. Because four Syrian priests were granted the right to stay at the Holy Sepulcher and because many Arabic, Syriac, Georgian, and Armenian speaking Christians were allowed to stay in Jerusalem after the Franks had left – some even exempted from the ransom tax – ([56]), it seems distinctly possible, even likely, that some Latin religious objects, possibly including liturgical books, may have been deposited with them for safekeeping.

The most famous example of the Crusaders hiding something away in 1187 – something that survives today – is found not in Jerusalem, but in Nazareth. When after the battle of Hattin the threat of conquest by Saladin was unavoidable, certain sculpture already completed for the Crusader shrine in the newly rebuilt Church of the Annunciation at Nazareth was apparently buried for safekeeping. This sculpture consisted of five capitals, one in a rectangular configuration, the other four in a polygonal design, which were intended for a shrine with a baldacchino to be erected over the site of the house of the Virgin inside the Crusader church. It is likely that this sculpture was buried in 1187 rather than in 1263, when the Church of the Annunciation was captured and razed by Baybars, for several reasons. First, there is a great deal of figural sculpture that survives from Nazareth, all of which seems to date from before 1187, most of which is severely damaged as the result of the 1263 destruction. That means these works were put in place before 1187 and then damaged when the church was destroyed in 1263. There is no way to explain why the five capitals would not also have been destroyed or damaged by Baybars if they had been put in place or even just left exposed to that time. Second, the five Nazareth capitals are also in nearly perfect condition, which appears to indicate that they were never put in place. We can see this not only on the basis of the figural designs, but also judging from their architectural components, that is, the stone flanges on the back of the capitals and their top and bottom surfaces. Thus it is more reasonable to think they were hidden away and buried in 1187 and never recovered after 1192 or 1229, than to imagine they were carved by the early 1180s, left in the workshop unused and undamaged until 1263, and then buried when Baybars threatened the town and church.[57] The ultimate tragedy for the Crusaders, but by the same token a truly fortuitous development for us, was, of course, the fact that the sculptures were never recovered by the Crusaders when they returned after 1192 or later in 1229 and they remained buried until they were excavated in 1908 by Prosper Viaud.[58]

It is evident in light of the references to various kinds of Crusader art and architecture discussed earlier, even limited as they are mostly to Jerusalem, that as a result of Saladin's conquest, the destruction was great and that there were enormous losses. It is also clear that some important art survived. A few manuscripts done in the scriptorium of the Church of the Holy Sepulcher survived and have been recognized.[59] Of the extant six codices, some were done for royal and some for ecclesiastical patrons. We do not know, however, whether they had left Jerusalem before 1187 or were saved at that time, taken first to Tyre, then to Acre or Cyprus, and finally shipped to the West later, or if they were sent directly to western Europe in 1187. It remains to be reconsidered whether they were known by Crusader artists working in the Latin Kingdom after 1187.

Some sculpture survived in situ, for example, on the façade of the Church of the Holy Sepulcher, in plain view but untouched by Muslims out of reverence for Jesus and for the place. The sculptural ensemble on the north entry portal to the Church of Santa Maria Latina also survived, although the church was later destroyed.[60] Much sculpture survived as *spolia* reused on the Haram, as mentioned earlier. Among the Nazareth sculptures, much that had been installed on the church remained in place on view, but the five famous capitals had apparently been buried and thereby survived to be discovered at the start of the twentieth century. The Church of the Holy Sepulcher, the Church of the Nativity, the Church of the Annunciation, with their rich decorative programs, and the shrines at these three primary holy sites survived, even if access by Western Christians was severely limited. It is noteworthy that even if the sculpture at Nazareth was mostly damaged or destroyed, albeit later in 1263, certain major programs of monumental painting survived: at Bethlehem – icons painted on the columns in an encaustic medium and the vast program of mosaics – and in Jerusalem – a huge mosaic program at the Church of the Holy Sepulcher. In fact, the Bethlehem mosaics survive today only partially, while the column paintings are extant more completely, and the mosaics in the Church of the Holy Sepulcher are mostly gone, to be seen only in terms of a few fragments. There is no evidence, however, that these programs were damaged by the Muslims in 1187, as the losses seem to be clearly from later, perhaps after 1291.

Many other Crusader churches also survived; some were appropriated for use as mosques and *madrasas*, especially in Jerusalem, but most were allowed to have their own religious services. Little metalwork survived save what may have been sent to the West as reliquaries. The fact is, however, in light of the numerous relics and reliquaries of the True Cross that had been sent to western Europe before 1187 from Jerusalem, that few if any were sent between 1187 and 1192.[61] It is a striking contrast to compare the lack of such sacred objects sent westward from Jerusalem in 1187 with the huge numbers that were dispatched after the sack of Constantinople in 1204. It clearly suggests that the Crusader metalwork industry worked on commissions in Jerusalem and that there were not numerous objects to be sent back to the West because Jerusalem was captured by Muslims, not by Christians. Treasures captured or bought by the Muslims were presumably mostly transformed into different configurations for their use, either as precious objects or for their precious materials.

In the face of the terrible destruction and the loss of the holy sites, the question is, how could the Crusaders retain a sense of their rich artistic tradition that had developed between 1099 and 1187? In view of the fact that the Crusaders were forced to relinquish precisely those holy sites on which Crusader art had been lavished in the twelfth century and around which their art had so richly developed, what would they use as models, as works on which to base their new painting, sculpture, architecture, and minor arts? Finally, because the Crusaders were forced to move their bases of operations and their political and ecclesiastical institutions into new centers, mostly located in port cities along the Mediterranean coast but also in heavily fortified castles, the context of art making changed radically.

The next few years would demonstrate how difficult the Crusader situation had become and that there was comparatively little time for artistic production in view of the urgent needs of military defense and the efforts to reclaim parts of the Latin Kingdom from the Muslims.

EVIDENCE FOR CRUSADER ARTISTIC ACTIVITY IN 1187 AND THE YEARS IMMEDIATELY FOLLOWING IN THE CRUSADER STATES

Prior to the attack on Jerusalem, Saladin and his brother, Saif ad-Din al-Adil, had taken possession of the main Crusader fortifications and cities in the Latin Kingdom of Jerusalem from Darum and Ascalon in the south, to Beirut, Gibelet, and Botron in the north, including the port of Acre.[62] Only Tyre remained uncaptured. It was assaulted on 13 November, following the conquest of Jerusalem, but Saladin had waited too long. In the interim, the Marquis Conrad of Montferrat had arrived on 14 July. He organized the defense and resolutely assured Saladin that "he could do his worst, for he [Conrad] would never, if it pleased God, surrender Tyre to him but would defend it against him with God's help."[63] Conrad was aided by a Spanish knight named Sancho Martin in green livery, the Green Knight, who led the daily Christian sallies out of the city. Despite the numerous war machines, petraries, and mangonels that Saladin had had constructed for this siege, they did not succeed in damaging the Crusader resolve to resist. The siege was broken by a strategem whereby Conrad tricked the Muslim fleet blockading the city into sailing five ships into the port of Tyre when its defensive chain was let down. The Muslim ships were ambushed, their crews killed, and the ships captured. Using these vessels, the Crusaders attacked the remainder of the fleet and drove them off. The result of this and a victory on land outside the main gate forced Saladin to withdraw on 1 January 1188.[64]

Tyre, with its magnificent cathedral, one of the largest Crusader churches in the Levant, thus remained in Frankish hands and Saladin was never able to take it. In light of his other conquests, even during the time of the siege at Tyre, this successful defense was the one important indication that the Crusaders might not be pushed into the sea. Following the defeats and devastation from June through December 1187 inflicted on them by Saladin, this victory was a ray of hope for 1188.

Saladin's campaign was not over, however. After wintering in Acre where he received ambassadors from other Muslim states and from the Byzantines,[65] he returned to Damascus in the spring to reorganize. Leaving his brother al-Adil to continue the attacks on Kerak and Shaubak in Transjordan in the south, in July 1188 he marched into the county of Tripoli. Bypassing the Hospitaller castle of Crac des Chevaliers, which he deemed impregnable, Saladin also found Tripoli, recently reinforced by a fleet commanded by Admiral Margarit from the Norman kingdom of Sicily, unassailable. Turning to the north instead, Saladin attacked and took the town of Tortosa but could not capture its castle which the Templars defended. Just up the coast, the huge castle of Margat was also too well fortified, and the Hospitallers who defended it harassed Saladin's army as he passed by. Leaving these tantalizing targets behind, his first major conquests, in late July, were the port city of Latakia and the powerful baronial castle of Sahyun in the hills east of the port.[66] This was followed by the capture of the castle of Bourzey, east–northeast of Sahyun, in late August.[67] It must be said that these were two spur castles completely isolated and built on the most difficult possible sites for attack, yet Saladin was able to take both of them in the matter of a few days. At this point, he approached the city of Antioch for the first time, moved quickly to take two castles north of Antioch, and threatened Antioch itself. Bohemond III sought a truce immediately. Saladin's troops were weary from their battles. By 26 September terms were worked out, and he returned to Damascus. Meanwhile farther south, Kerak, Shaubak, Safed, and Belvoir capitulated to al-Adil, the last on 5 January 1189. Belfort, overlooking the Litani River east of Tyre, was still struggling to hold out. Eventually, in May of 1190, Saladin would receive the surrender of Belfort, but by that time it would not matter so much; the Third Crusade would already have begun its first attack on Acre.

By the end of 1188, however, the situation had gone from bad to worse for the Crusaders. Not only had they lost more valuable territory and many major strongholds, but they also were pinned into three small positions along the coast – at Tyre, at Tripoli, and at Antioch and their more or less immediate environs. Only the great Hospitaller castles at Crac des Chevaliers and Margat and the Templar citadel at Tortosa held out otherwise as well. In this dire situation, help was beginning to take shape in the form of the Third Crusade, for which the pope had issued the call already in late October and early November, 1187. If only the Crusaders could hold their meager possessions a bit longer. Not surprisingly, in these dark days there were few artistic projects underway, but this is not to say there was no artistic work in progress at all.

After the Patriarch Heraclius left Jerusalem with his pack animals filled with treasures and money salvaged from the major Christian churches, his whereabouts are mysteriously lost for the next eighteen months. Whereas it would have been expected that he might go to Tyre, or even Tripoli, seeking refuge, because of reasons of proximity and his office as patriarch for the Latin Kingdom, the only indication we have suggests otherwise. An anonymous text written years later, after the Third Crusade, suggests that he went to Antioch, but Tyre is not out of the question.[68] If so, one wonders where the precious objects that he "saved" from Jerusalem ended up. There is no concrete indication in the 1209 inventory of the Cathedral of Antioch that any of those objects had come from Jerusalem in 1187.[69] Heraclius died sometime in late 1190, well before the Crusaders retook Acre. The new patriarch of Jerusalem was not named until 1197, when Archbishop Aimery of Caesarea was chosen and took his position in the Church of the Holy Cross in Acre.[70] Where had these objects gone in the interim? Were they eventually brought to Acre for Aimery to use?

The Coinage in the Latin Kingdom

Similar questions about the monetary history of coinage in the Latin Kingdom can be asked. Michael Metcalf points to a forty-year hiatus in the all important hoard evidence, between the 1180s and the 1220s, that presents major problems in assessing what developments there were.[71] Two specific questions arise in regard to 1187. One has to do with the possibility of a special issue of coinage struck to pay the defenders during the siege of Jerusalem. The other has to do with the question of currency prepared before the conquest and what happened to those stocks when Acre and Jerusalem fell.

First, the Eracles, one of the Old French continuations of William of Tyre, states the following: "Then Balian and the patriarch went and had the tomb aedicule of the Sepulchre which was all covered in silver uncovered; and then they had it taken away to be struck into money to give to the knights and sergeants."[72] This story suggests that the Patriarch Heraclius authorized turning some special treasure of the church to monetary use for the defense of the Holy City. The story is fanciful in some aspects, but it is not difficult to evaluate the motive of the author of the Eracles, who alone includes this narrative; he is making the patriarch appear like a hero. Nonetheless the story is plausible. Other Crusader coins had presumably been minted in Jerusalem before this time. An emergency issue certainly could have been struck even in the brief time indicated in the Eracles account. The story of Balian and the patriarch is placed in the Eracles between the battle of Hattin on 4 July and the fall of Sidon and Beirut in late July, so the indication is that there would have been at least five or six weeks before Saladin and his army appeared before the walls of Jerusalem to begin the siege.[73] What is the coin evidence?

An anonymous denier that carries the Tower of David on the obverse, and the Holy Sepulcher on the reverse, has been proposed specifically as this emergency coinage (Fig. 1a).[74] The imagery of the coin itself is complex and requires detailed analysis to understand its meaning.[75] Porteous and Sabine agree basically on the interpretation of the fragmentary

inscriptions that survive on the six extant examples.[76] On the obverse, we find "+ TURRIS DAVIT" (retrograde); on the reverse, "+ [SEPULCHRUM] DOMINI." These inscriptions correspond with the imagery of the Tower of David and the Holy Sepulcher on each side, but what is the source of the inspiration for these choices, and how exactly are they represented?

First of all, it is clear that this is an unusual coin because it is anonymous.[77] Second, the coin is also unusual because of its program. Instead of the normal obverse on a royal coin from Jerusalem with a cross surrounded by the name of the king (e.g., "Balduinus" or "Amalricus") and the normal reverse with the image of some architectural feature surrounded by the name of the place (e.g., "de Ierusalem"), the obverse and reverse both have architectural images with specific identifying inscriptions but without references to any persons or specific mention of Jerusalem. This seems to indicate that this is not a royal issue, but it is clearly a coin closely tied to Jerusalem.

What is the meaning of this coin? In the first place, although Sabine never explicitly says it, the choice of the Tower of David and the Church of the Holy Sepulcher corresponds directly to the story in the Eracles where Balian and Heraclius jointly caused this coin to be made. We see this in terms of the obverse referring to the surrogate royal representative, Balian in this case, and the reverse referring to the ecclesiastical representative, the patriarch. Second, whereas the coin is clearly a special, not a regular issue, the combination of the Tower of David and the Church of the Holy Sepulcher would appear to derive from the two most popular royal coin issues of the second half of the twelfth century, namely, the *Balduinus* and the *Amalricus* deniers.[78] Despite these obvious *comparanda*, however, it should be noted that the anonymous coin is on average heavier, 1.0 grams, compared with 0.95 or 0.9 grams for the *Balduinus* and *Amalricus* deniers, respectively.[79] Third, we can observe that by choosing this unusual pairing on one coin, the patrons and designer have focused attention on the Holy City of Jerusalem and on the characteristic iconography of architecture that is typical of royal Crusader coinage before 1187.[80] But what specifically does the iconography of the obverse and reverse convey about Jerusalem before the siege in 1187 that differentiates the imagery on this coin type from its predecessors and its successors?

The Tower of David on this coin is distinct from the image on the *Balduinus* denier in a number of details.[81] Although the number of battlements along the top is the same (i.e., four), the patterning of the tower masonry is different, and the 1187 coin seems to include three curved openings in the central portion of the tower. The *Balduinus* coin has no openings indicated, only masonry. Finally, the 1187 coin has paired L-shaped protrusions on the sides of the tower. On some of the coins the protrusions are all positioned upward; on two of the coins, the upper pair is positioned upward, the lower pair is positioned downward.[82] These protrusions may be representations of special platforms placed on the exterior of the tower for its defense, seen in section.[83]

The representation of the Holy Sepulcher on the 1187 coin is distinct from the image on the *Amalricus* denier by showing the tomb of Christ underneath an architectural superstructure. It is difficult to decide how we should interpret this superstructure. Is this meant to represent the Church of the Holy Sepulcher, which is the normal iconography found on contemporary and later coins and seals, but which is not easily recognized here? Or is this a particular interpretation of the aedicule of the Holy Sepulcher in which the tomb of Jesus was sheltered, for which we do not have any contemporary comparative example? We have argued elsewhere that the *Amalricus* denier shows only the rotunda for political reasons, and omits the aedicule and the tomb.[84] It is significant that the tomb of Christ is represented here in the lower portion of the 1187 coin, and thus given special prominence as the holy site the Crusaders wished to defend. Sabine has discussed the iconographic details of this 1187 coin reverse at length, but a different interpretation of certain aspects may be more accurate.[85] The two essential components are the tomb of Christ under the lower arch, and the complex superstructure, versions of which are variously rendered on other coins and seals.[86] I suggest, however, that the superstructure here is meant to be a view of the aedicule specifically, a view that is difficult to explain in detail with regard to the Crusader structure itself because of later changes in the structure and decoration of the aedicule after 1808.[87] Nonetheless, the reason the superstructure of the aedicule is of primary importance here is clearly, first, the fact that the metal for these coins was taken from the aedicule, as the text in the continuation tells us. Furthermore, second, the superstructure rendered here does not correspond to any of the other more familiar renditions that represent the Church of the Holy Sepulcher, as found on the relevant coins or seals mentioned above. But third, we note that in later manuscript illumination in Acre between 1250 and 1291, we do find representations of both the superstructure of the overall church – some with the tomb and some without – and more specifically the superstructure of the aedicule only.[88] Thus these manuscript illustrations demonstrate that it is possible to find depictions of both the church and the tomb aedicule superstructures as distinct entities, so in principle we can expect the same possibility in earlier coins. In sum, the 1187 coin is a remarkable issue that by its program seems to focus, on the one hand, on the defense of Jerusalem in terms of the Tower of David, which anchored the fortifications of the city on the west side, and on the other, on that for which Jerusalem was worth defending, the Holy Sepulcher and its aedicule in particular.

Second, in regard to the *Amalricus* coins from the Latin Kingdom, minted in Acre, what happened in the period between the loss of Acre in 1187 and the recapture of Acre in 1191? "Where

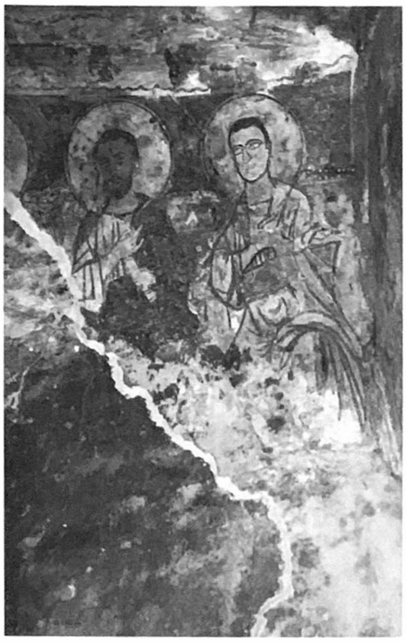
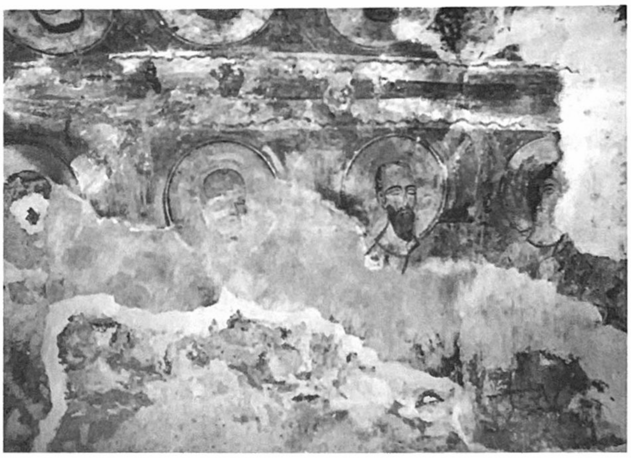
had the stock of currency, amounting to perhaps ten or twenty million deniers, been scattered in the three or four intervening years – was it still in existence? How soon was the minting of *Amalricus* deniers resumed, how much did the new issues weigh, and which are the dies that struck them?"[89] We shall consider these questions as we evaluate the complicated history of Acre between 1187 and 1191, that is, during the period that the Third Crusade comes into being.

The Castle of Margat

When in July 1188 Saladin began his campaign in the north, his army passed by the great Hospitaller castle of Margat, its Old French name, also called Marqab from the Arabic. Remarkably, it appears that despite the dangers of these years (1187–8), a fresco project was underway in the castle chapel just about the time that Saladin marched by. The Hospitallers had taken control of Margat only recently, on 1 February 1186. One of their first building projects was the construction of the castle chapel in 1186–7 (Fig. 2b). It was a chapel that resembled the earlier chapel at Crac des Chevaliers in some respects, but differed in others. It was, for example, slightly larger in overall size (interior dimensions: 23 × 10 meters), but had only two large bays (Figs. 3 and 4), instead of three as at Crac. Its bays were covered by groin vaults instead of the pointed barrel vaults found at Crac, and it also had a larger apse and two pastophoria, accessed directly from the apse. Following completion of the building, the Hospitallers initiated the decoration of the chapel.[90]

Starting with the northeast room flanking the main apse, a room that might have served as a sacristy or even as a special chapel, a program of fresco painting was begun and completely finished, although the remains are now fragmentary (Figs. 5–8).[91] The paintings that survive indicate that the program included several components. There is a Nativity scene including the three magi in the lunette of the west wall under the vault. In the vault itself there is a Pentecost scene with the twelve apostles who receive the inspiration of the Holy Spirit seated on benches along each side of the vault. A cloudy strip runs along the crown of the vault from which the red rays emanate.





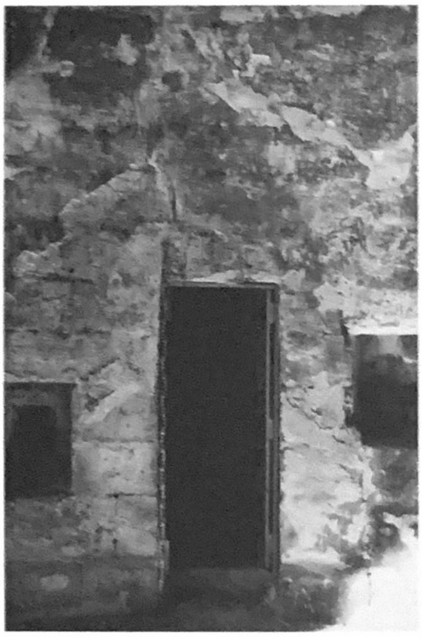
5–8. Margat Castle.
5. *(top, left)* Northeast room, view looking west.
6. *(top, center)* Northeast room, view of vault, 2 apostles (nos. 5 and 6) on south side of vault.
7. *(top, right)* Northest room, view of vault, apostles 1 and 2 on south side of vault.
8. *(opposite)* Northeast room, view of vault, apostles 7, 8, 9, and 10 on north side of vault.

Below the Pentecost, on the side walls of the room, there were two series of frontal, probably standing saints under arcades, of which only the tiniest fragments survive. Based on these meager fragments we can suggest that there were originally twelve saints in these arcades, but it is not possible to identify the figures. No painting survives from the east wall lunette. Although it is likely there was an image that was part of the program here, there is no evidence for whatever the scene may have been. All we can propose is that it may have been one of the main festival scenes from the ecclesiastical year. Finally there are indications of a variety of decorative floral and geometric motifs on the lower walls and around the entry door.

The mixed technique of these frescoes is very common among the Byzantinizing paintings of the period in this region. Furthermore, the style of the work has clear links to local frescoes located to the south in what is now Lebanon and to the east in what is now Syria.[92] The basic Byzantine roots of the iconography in the Nativity and the Pentecost scenes are apparent, even if, as appears likely, the models were somewhat simplified. It is interesting that the configuration of the Pentecost scene on the vault suggests that the artist was using a flat model, perhaps from a manuscript illustration or an icon, not from a composition in a dome.[93]

The most important artistic *comparanda* for the Margat frescoes are found in Mar Musa near Nebek, south of Homs. The main ensemble of painting in this Syrian monastery can be dated to 1192, that is, very shortly after the work at Margat. Comparison of the apostles in Margat to those in the scene of the Last Judgment at Mar Musa demonstrate that the quality at Margat was higher, but they both share in the regional style fostered by the Eastern Christian establishments in this area, mainly Syrian Orthodox and Maronite.[94] This evidence clearly suggests that the main artist was a locally trained painter working for the Hospitallers. It is reasonable to consider the possibility that this artist might have been a Hospitaller who had perhaps begun his training in Jerusalem, but then continued to learn from Eastern Christian painters in the region where he was stationed. It is possible also, however, that he was a local Christian painter in the service of the Knights of St. John here at Margat.

The close association of the painter and his work with this region is further indicated by the small fragments of standing saints under arches along the side walls of this room.[95]



9. Margat Castle, chapel interior, apse wall (outside northeast room), north side with fragmentary remains of fresco underdrawing in geometric patterns.

Although we cannot identify the individual saints by name, we can see the geometric design of the arch under which they stand, a format and a repertoire of decorative design widespread in this area.[96]

In the main apse area, fragmentary remains are found on the north and south walls below the apse conch. On the wall adjacent to the door into the northeast room, we find painted in a light red pigment on a plain ground, a schematic drawing for a decorative design (Fig. 9). The pattern revealed is geometric in form with a grid in which lozenge-shaped forms containing equal-armed crosses alternate with those containing vertical stripes. The arms of the crosses are approximately 5 centimeters wide and 10 centimeters long, the vertical stripes are approximately 4 to 5 centimeters wide, and the lozenge grid measures approximately 26 centimeters on a side. These drawings are found up to a height of 3 meters on the wall. Clearly these designs constitute the underdrawing for the fresco planned for the dado of the apse end of the chapel.[97] On the basis of the examination of the whole apse end, we draw the following conclusions: first, these underdrawings are all that were completed; no finished paintings are found in this area. Second, nothing was done in the apse conch itself. Third, no trace of other painted plaster layers could be found elsewhere in the chapel. Fourth, on the basis of these observations, it appears that the project of decorating the apse of this chapel was planned, that work began on the lower wall but was interrupted and never continued or completed.

The dating of these frescoes and underdrawings must clearly come after the completion of the chapel *c.*1187.[98] The style of the Pentecost apostles corroborates this dating, but it is not possible to be more precise other than saying the work was done shortly after 1187. Because the sequence of painting appears clearly to have started in the northeast room and then moved to the apse wall area, before being abruptly terminated and left unfinished, some important cause can be considered for the interruption. The two obvious possibilities are the campaign of Saladin in the summer of 1188 and the major earthquake that hit Syria-Palestine in May 1202.[99]

Because there is no evidence of physical damage to the chapel or to the apse area where the frescoes are found, one is inclined to discount the importance of the 1202 earthquake as the reason work stopped. It is therefore at least plausible that when Saladin began his campaign along the northeast coast of Syria, the Hospitallers turned their attention to defending the castle and harassing Saladin's army. When the Hospitaller garrison went on full alert in effect, conceivably the painting project was stopped.

Although it is not clear why it was not resumed at a later date, the demands of defending the castle in difficult times may have prevented the fresco project in the castle chapel from being completed. Furthermore, we know that the chapel was called on to serve an unusual role at this time. When Saladin marched past Margat, he did not threaten the castle, but he did capture the town of Banyas (Valenia) immediately to the north in 1188. In these circumstances the bishop of Valenia, suffragan to the archbishop of Apamea, transferred his *cathedra* to Margat. Therefore the castle chapel also served as his cathedral church. Later on, in addition Margat served as a residence for Isaac Komnenos, the Greek ruler of Cyprus defeated by Richard I in 1191.[100] Serving in the capacity of residence or prison for distinguished guests, it is perhaps surprising that the frescoes were not completed. Unfortunately, no pilgrim who visited Margat comments on the frescoes. It seems to have been the case that, for whatever the reasons, the manpower and the money ran out and the fresco project was left unfinished.

Despite the details we do not know about Margat between 1187 and 1202, the situation at Margat in the late twelfth century demonstrates that, just as Crac des Chevaliers demonstrated in the 1170s,[101] castles were in fact given artistic decoration in certain parts and that a chapel was one of the most important objects of artistic embellishment. In fact, most of the religious and communal rooms in these castles very likely also received decoration of one kind or other.[102] These places could have some form of fresco painting, as we have seen, but they could also have had decorative sculpture with foliate or even figural designs, along with military armor, weapons, trophies, or other memorabilia, as appropriate. There may also have been wall hangings and carpets in the private quarters of the highest ranking officers.

Margat is an important example of a major Crusader fortress that provides concrete evidence for possible artistic activity within its walls, even here at the nadir of Crusader fortunes between 1187 and the Third Crusade. Even though castles are not obvious centers for artistic workshops, and in general may be sites for local artists in contrast to the more highly trained painters and sculptors at major court, ecclesiastical, and pilgrimage centers, art was produced within their walls. Given the focus on Crusader fortifications in the years between 1187 and 1291 because of defensive necessity, it is clear that we need to scrutinize every important castle for any possible examples of artistic work.

Conclusions

The events of 1187 and 1188 clearly had a major impact on the artistic activities of the Crusaders in the Holy Land. Many important works of architecture and the figural arts were lost or destroyed by a variety of means. Frankish artists in Jerusalem who survived the siege were forced to leave the city and seek refuge. Crusader artists in other cities captured by the Muslims at this time (e.g., Acre or Beirut) must have also sought safety where possible. Some must have gone to Tyre, Tripoli, and Antioch. Some may have left the Near East and gone elsewhere.

Some important portable works were saved either by being hidden away or by being taken to Frankish held locations, especially Tyre, Tripoli, or Antioch. In the first category, the Nazareth Capitals were saved, but lost to the Crusaders as a result. In the second category, no works preserved have been surely identified as such, but there are six extant illuminated manuscripts that may have been saved in this manner. Also the Antioch inventory mentions golden codices, a gospel book, and other service books.

Few new works of Crusader art can be identified from this period. A major fresco project was apparently interrupted at Margat during Saladin's attacks and never completed. A new coin was apparently minted in Jerusalem. In both of these cases, however, the evidence is thin, and obviously little attention was being given to art making in the face of mortal danger. What artistic production, if any, would be possible in the midst of the strenuous activity which followed during the Third Crusade?

THE CRUSADER STATES AND THE ADVENT OF THE THIRD CRUSADE, 1187–92

Following the disaster at Hattin, Joscius, archbishop of Tyre, sailed westward seeking help in the late summer of 1187, after Saladin's first assault on the city of Tyre, but before his attack on Jerusalem.[103] Traveling in a galley with black sails, to symbolize the bad tidings he bore,[104] Joscius went first to Sicily where King William II recalled his admiral, Margaritus, from Byzantium and ordered him to go to the aid of Tyre. Joscius then went on to Rome where the Genoese had already brought news of Hattin and the fall of Jerusalem. When the news of these disasters reached Rome, the reigning pope, Urban III, died of grief, as the Old French continuation reports, and points out in addition that it had been in the time of Urban II when Jerusalem was conquered and the time of Urban III when it was lost.[105] The new pope, Gregory VIII, wasted no time in issuing the call for a new Crusade at the end of October and the beginning of November, 1187. Richard of Poitou, acting on impulse, was the first important figure to take the cross, in November 1187,[106] but as Richard I of England, he would be, with Philippe Augustus, one of the last major rulers to set out.

After issuing his encyclical, *Audita tremendi*, Gregory appointed Henry, cardinal bishop of Albano, as his official legate and sent him off to preach the Crusade in Germany and France. But within two months Gregory had also died, on 17 December 1187. His successor, Clement III, took office two days later.

Henry, the papal legate, went first to Germany where there was a council scheduled at Mainz in March 1188. Henry's exhortations on behalf of the new Crusade complemented those of the pope's encyclical, by laying more stress on the loss of Jerusalem and the fact that the Holy Sepulcher was in Muslim hands. Frederick I took the cross on 27 March. In France, Joscius, archbishop of Tyre, arrived at a meeting between Philippe Augustus of France and Henry II of England at Gisors. Henry II had learned of the problems in the East from a letter sent to him by the aged patriarch of Antioch, Aimery, in September 1187. Both kings and many of their followers took the cross there 21 January 1188. Philippe, count of Flanders, also vowed to go on Crusade. The French were given red crosses to wear; the English, white; and the Flemish, green. Shortly thereafter, both kings levied special taxes; in France and England the tax was known as the "decima Salahadini," the Saladin Tithe.[107] This was not the first taxation for the Crusades; earlier attempts had been made in England in 1166 and 1184. It was more successful in England than ever before, however, and resulted in more people being directly involved in the Third Crusade, by participation in its financing, than the First or the Second Crusades. Meanwhile, farther south, William II, king of Norman Sicily, had arranged to send a small fleet to aid the Latin Kingdom, in March 1188. These reinforcements enabled Bohemond IV to resist Saladin and maintain Crusader control over Tripoli. William II himself planned to join the Crusade as well and sail eastward with the English, but he died before they arrived, on 18 November 1189.

The major European rulers thus responded positively to the emergency in the Holy Land, but despite the best of intentions, even this Crusade started with great fervor for a worthy cause was delayed and fragmented while the situation in Syria-Palestine remained desperate. Frederick I's date of departure was set as 23 April 1189, the Feast of St. George, a little over a year after he had taken the cross. In fact he was the first to leave, with a large, well-equipped army, on 11 May 1189, very close to schedule. He left from Regensburg, taking the overland route through Hungary into the Byzantine Empire.[108] He sent an embassy to Emperor Isaac Angelus in Constantinople to arrange passage through Byzantine controlled territory. The treatment of that embassy was revealing – both to Frederick and about Emperor Isaac Angelus and Saladin.

When the bishop of Münster and his accompanying envoys arrived in Constantinople in mid-June 1188, Isaac had them thrown in jail, ostensibly as hostages to ensure German good behavior. The Old French continuation remarks matter-of-factly, "that is not something to be surprised at, for the Greeks have always hated the Church of Rome and Latin Christians."[109] Frederick's response to this unlawful act was to try to force the Byzantine emperor to release them by the military power he displayed as his army moved eastward through Bulgaria to Adrianople. The members of the embassy were indeed finally freed, but only in late October 1189. While the German army was camped at Adrianople for the winter, Isaac was eventually forced to agree to a treaty in February 1190, granting Frederick passage to Asia Minor, access to food markets, and Byzantine hostages to ensure compliance. Frederick and his army crossed the Dardanelles at Gallipoli, bypassing Constantinople as part of the treaty. By the end of May 1190 he had marched across Asia Minor and was entering Cilician Armenia. One result of this experience was that Frederick was confirmed in his suspicions that the Byzantine emperor was no friend of the Crusade or the Franks.

Meanwhile, Isaac had sent an embassy to Saladin after his impressive victories at Hattin, Acre, and Jerusalem. The purpose of his diplomacy was to renew the alliance with the

Ayyubid sultan initiated by Emperor Andronicus in 1185.[110] On 6 January 1188, Byzantine envoys arrived in Acre where Saladin was holding court, receiving the congratulations of his allies. As was the custom for major diplomatic events in the Near East, Isaac sent remarkable gifts: four hundred breastplates, four thousand iron lances, five thousand swords, twelve samite cloths, two golden cups, two imperial robes, and three hundred beaver pelts, as well as a gold crown to recognize Saladin as a king, and, of course, as also subject to the emperor.[111] The envoys stressed the emperor's thanks to Saladin for having released Alexius Angelus, Isaac's brother, from a Crusader prison in Acre in July. The emperor was also pleased at the treatment Saladin accorded Orthodox residents of Jerusalem in October, and the notion that he had turned over the important Christian sites to Orthodox clergy.[112] Saladin received the envoys most cordially. The most important news they brought him, however, was word of the new Crusade being organized in the West.[113]

In light of this disturbing development, Saladin perceived how useful a continuing alliance with Byzantium might be. He responded positively with remarkable gifts of his own: twenty Latin chargers, large boxes of gems and balsam, three hundred strings of jewels, a chest filled with aloes, 100 musk sacs, twenty thousand bezants, a baby elephant, a musk deer, an ostrich, five leopards, thirty quintals of pepper and numerous other spices, a silver jar of poisoned wine, and large amounts of poisoned flour and grain, the latter items apparently for the Byzantines to give to Frankish Crusaders.[114] In addition, Saladin sent a *maumeria*, some kind of minbar or pulpit, which Isaac was presumably to set in the one functioning mosque in Constantinople to be used for prayer. It was a gift no doubt comparable to the minbar of Nur ad-Din which Saladin had had installed in the Aqsa Mosque in Jerusalem.[115] Saladin's *maumeria* became something of a cause célèbre, however, when the Genoese captured the ship carrying this work and took it to Tyre. On its arrival there, Conrad of Montferrat interpreted the minbar as evidence for the alliance between Saladin and the Byzantines; he therefore sent a letter dated 20 September 1188 to the West announcing this distressing state of affairs. Philippe Augustus even caused this information to be used to help recruit Crusaders in French territory.

Despite his treaty with Saladin, Isaac Angelus was unable to prevent or even much impede the advance of Frederick I across the empire in the summer and fall of 1189 and the following winter, as we have seen, much to Saladin's disgust and alarm. With further word from various sources confirming that the kings of France and England had also taken the cross, Saladin actively began to make preparations for the coming battle. He commanded that Acre be refortified and put on a war footing.[116] With news of the approach of Frederick and his Crusaders to northern Syria, Saladin considered how to prepare for the attack. The Lyon Eracles states the following:

> Saladin was so frightened at the coming of the emperor that he had the walls of Latakia, Jabala, Jubail, Beirut and all the other cities along the coast destroyed so that the Christians could have no protection there. He was afraid that as the emperor made his way down he would fortify the cities and castles and, if he found them intact, he would occupy them and have them garrisoned and thus damage the Saracen cause. For this reason Saladin had the cities and castles of the coast laid waste.[117]

This text indicates that the walls of Beirut were taken down – Pringle interprets this to mean the town walls, but not the castle, in 1190[118] – along with those of other cities in Syria. The walls of "all the other cities along the coast," that is, cities south of Beirut, would only be dismantled later. While these operations were underway, disaster struck the German Crusader army. Frederick I died while trying to cross the Saleph (Göksu) River near Seleucia on the coast. This occurred on 10 June 1198. A greater calamity for the Crusader army could not be imagined. A new leader was elected, but the army split into three parts. One part sailed from Tarsus to Tripoli, one part sailed from Tarsus to Antioch, and one part, in the manner of a funeral cortege took Frederick's corpse overland to Antioch where the *Itinerarium* records the gruesome details: "At Antioch they boiled the body for a long time to separate the flesh from the bones. The flesh was laid to rest in the church of the apostolic see of Antioch. The bones were carried by sea to Tyre to be transported to Jerusalem."[119] The Lyon Eracles reports: "His body... was carried to the city of Antioch where it was honourably interred in the church of Saint Peter on the right of the choir near the tomb of [Adhemar] who had been bishop of Le Puy. On the left is the place where the lance with which Longinus pierced Our Lord Jesus Christ on the Mount of Calvary was found."[120]

In fact, as optimistic as the *Itinerarium* author was, Jerusalem was not to be retaken by the Third Crusade, and the bones were eventually buried in the Church of St. Mary in Tyre.[121] Meanwhile, Frederick's army had been decimated by the departure of soldiers to return home, by Muslim attack, and by plague in Antioch. When the meager remnants finally arrived at Acre in October 1190, they joined up with other German contingents, which had sailed from Cologne and from Brindisi. A German hospital community was also founded in the camp at Acre in these circumstances,[122] but disease and death took its toll to the extent that few Germans survived to fight with Richard I and Philippe Augustus when they finally arrived at Acre in the spring of 1191.

Saladin had conquered Acre immediately after Hattin, on 10 July 1187, and Jerusalem had fallen on 2 October, but Tyre was held firmly with defenders led by Conrad of Montferrat acting as the "lieutenant of the kings of Outre-Mer."[123] Conrad and the Crusader barons granted major concessions to the Pisans and Genoese, putting them on a level equal with the Venetians, and special commercial privileges were also made to merchants from Barcelona and southern France, to ensure their support. Conrad ordered the moat to be deepened and the walls strengthened. Refugee soldiers from cities conquered by Saladin were organized for the defence of Tyre. Although Saladin besieged Tyre twice, he could not take it and he retired to Acre on 1 January 1188. Saladin possessed Jerusalem and Acre, and king Guy de Lusignan, captured at Hattin, was his prize prisoner. Saladin could not conquer Tyre but what remained of the Latin Kingdom of Jerusalem had no king.

Queen Sibylla had written to Saladin repeatedly, begging for the release of her husband who had been imprisoned in Damascus, and she wrote again from Tripoli. Finally, during his Syrian campaign through the County of Tripoli in the summer of 1188, Saladin agreed, partly to honor this royal lady's request and because he had released almost all of his other noble hostages. It seems to have been a generous act, but also no doubt he could see the possibility that freeing Guy would weaken the Christians by causing dissension. Before he let Guy go, he extracted an oath that the king would not bear arms against him and would go overseas, an oath that Guy had dissolved immediately when he was liberated. The Lyon Eracles says he was freed in Tortosa, sailed to the offshore island of Ruad, and then was reunited with his wife, Sibylla, in Tripoli.[124] This happened just before Saladin conquered the town of Valenia near Margat.

Guy immediately began the process of trying to reestablish his royal power. He gathered his supporters in Tripoli and sought the backing of Bohemond of Antioch. Then in the spring of 1189, accompanied by his brother, Geoffrey, he marched to Tyre to assume command of the sole city in the Latin Kingdom still in Crusader hands. Conrad of Montferrat refused to let him enter, taking the position that he was holding the city for the Crusader kings coming to the Levant.[125] Guy "realized that in all the kingdom there was not a village or a house where he could lodge, he had great sorrow in his heart."[126] He and his men camped outside the city of Tyre, Christian confronting Christian. It was a disturbing precedent to the situation in 1204 outside of Constantinople, made worse here, perhaps, by the fact that both leaders were Crusaders.

At Tyre, the situation was resolved when King Guy decided that the better part of valor resided in an assault on a Muslim-held, not a Christian-held, city. In effect, if his supposed Crusader ally, Conrad of Montferrat, would not relinquish the city to him, he would reestablish his royal position by retaking his own city from the Muslims. He bravely decided to attack Acre, surprising Saladin completely and beginning what became a long siege, one which started on 11 August. It was St. Augustine's Day, 1189.

Guy was accompanied by a Pisan fleet, and upon arrival he attempted an immediate and audacious assault on the city. [127] Outnumbered ten to one according to the Lyon Eracles,[128] this attack did not meet with success. During the fall, his position improved as a number of his leading vassals, men who had remained uncommitted or had supported Conrad at first, joined his army at Acre. Other contingents of Crusaders came as well: Danes, English, French, Germans, Italians, and Netherlandish troops among others arrived in September. This was truly a richly multicultural Crusader army already and the two greatest kings from Europe had not yet arrived with their forces. Conrad of Montferrat was even persuaded to come to Acre, as long as he did not have to serve under Guy's command. Herein lay a weakness in every confederated Crusader army, separate contingents with separate commanders. Meanwhile Saladin arrived at Acre to besiege the besiegers. Although positioned between Saladin's troops and the city defenders and continuing to be outnumbered by the Muslims, the Crusaders were able to survive the first major battle in October. King Guy even saved his rival Conrad of Montferrat from certain death.[129]

The Crusaders dug trenches to protect their exposed position. Through the winter there was a stalemate. Guy and Conrad reached an understanding by which Conrad would recognize Guy as king, if Guy would grant Conrad rights to Tyre, which he already held, as well as to Beirut and Sidon, when they might be retaken. In the spring and summer major battles were fought in May and July. In November the Crusaders forced Saladin to move his camp to a position more distant from the city. At some point during these months a list of Saladin's troops was apparently written in the Crusader camp. The diversity of his troops was both a source of strength and weakness for his army.[130]

Meanwhile, the political situation at Acre had become more complex because of factional divisions among the resident Crusaders. When the queen, Sibylla, and her two daughters, Alice and Maria, died in the summer of 1190 from disease,[131] suddenly the heir to the throne of Jerusalem was her sister, Isabel, wife of Humfrey of Toron and daughter of King Amaury and Queen Maria.[132] In fact it appeared questionable whether Guy's claim to the throne could survive his wife's demise. The Lyon Eracles identifies Conrad of Montferrat, Guy's old nemesis, as being so ambitious for the crown of Jerusalem himself that he persuaded Isabella's mother, Maria, to challenge Guy's right to the crown.[133] Maria, who disliked Isabel's current husband, Humfrey of Toron, forced her daughter to renounce her marriage on the grounds that she had married Humfrey in 1183 at age eight against her wishes. She was now fifteen and being forced to renounce a husband she loved, Humfrey, who was a friend of Guy's, all because of the designs of her ambitious mother and her ally, Conrad! The machinations around Isabel constitute a divisive chapter in political maneuvering even while the Crusaders were encamped at Acre in the fall of 1190. The marriage was annulled by the papal legate, Ubald, archbishop of Pisa, and Philippe of Dreux, cousin of Philippe Augustus and bishop of Beauvais. The representative of Heraclius, patriarch of Jerusalem, who was too ill to be present, was Baldwin, archbishop of Canterbury. The aged Baldwin stoutly defended the rights of Guy and refused to approve the annulment or countenance the marriage of Conrad to Isabel; it was only when he died suddenly, on 19 November 1190, that this situation could be resolved. Isabel married Conrad on 24 November 1190.[134] The Lyon Eracles soberly observed: "One might yet question whether the kingdom of Jerusalem was not put on a dangerous and dwindling course because of this deed."[135]

The marriage apparently took place in the camp at Acre. Nonetheless, Guy, who had been crowned king, refused to yield his rights; Conrad considered himself king of Jerusalem but could not yet be crowned. This standoff continued while the Crusaders waited in camp for the kings of France and England with their armies. Food was short,[136] disease was rampant, many Crusader nobles died that winter: Frederick of Swabia died, and Henry of Champagne nearly died he was so ill. Saladin used his reinforcements to harass the Crusader encampment.

King Philippe of France finally arrived in the camp at Acre on 20 April 1191, with his army and many ships full of supplies. After riding around the city walls, he is said to have observed, "considering how many noblemen have been at this siege, it is extraordinary how slow they have been to take it."[137] The siege had already been underway for twenty-one months. Philippe now assumed leadership and he intensified pressure on the defenders with constant attacks by his crossbowmen and archers, and he set his sappers to mine the wall abutting the Maudite tower. But he did not propose to try to take the city yet. The Lyon Eracles remarks:

> The king of France could easily have taken the city had he wished. But he was waiting the arrival of King Richard of England because they had travelled together and had made an agreement after they had left their lands concerning all the conquests they should make. So he waited for him, as he wanted to share in the joy and the conquest of the city.[138]

King Richard of England arrived at Tyre on 6 June and then continued to Acre on 8 June. He had been delayed en route by a stop at Limassol and a brief campaign, 8 May–5 June, to conquer Cyprus. Before that campaign he married Berengaria, daughter of the king of Navarre, on 12 May 1191 in the Church of St. George in Limassol. During his campaign he had rapidly defeated and captured Isaac Ducas Comnenus, the maverick Byzantine ruler of the Island. The conquest of Cyprus would prove to be the most long-lived and consequential of Richard's achievements in the Near East. Nonetheless, Richard sold the island to the Templars in early 1192; clearly his main objective was Jerusalem and the Holy Land, not Cyprus, and sale of the island, even with only the partial payment he in fact received, no doubt provided welcome income for his Crusade expenses in Palestine.[139]

When Richard arrived at Acre, he provided the catalyst to spur the Crusaders on to victory. Crusader ships now controlled the sea; their siege engines battered the walls with destructive effect, and assaults were made into the breaches in the walls. Death, illness, and bickering in camp slowed the attack, however. The patriarch, Heraclius, died. Both Richard and Philippe were taken seriously ill. Unity was disrupted by disputes between supporters of Guy and Conrad; furthermore Philippe and Richard quarreled over the inheritance of Philippe, count of Flanders, who had died just before Richard arrived. Thus, local politics continued to impede the cause at hand, and squabbles over territory as far away as Cyprus and Flanders distracted the two great leaders. These factors were bad omens for the future. Nonetheless, the siege engines and constant attacks were doing the job. Furthermore, Saladin could not break through to reinforce the city defenders. They surrendered on 12 July 1191. The city of Acre was turned over with all its contents.[140] "The kings' banners and multiform flags were raised high over the walls and towers."[141] The siege had lasted twenty-three months and one day.

The terms of the surrender included a payment of 200,000 *dinars* in exchange for the lives of the Muslim garrison, the return of a large number of Christian prisoners, and the relic of the True Cross was to be given back.

The Crusaders held a sizeable group of hostages to make sure the terms were met. Baha ad-Din mentions that Conrad of Montferrat was to be paid four hundred *dinars* personally for his role as intermediary in the negotiations.[142] Saladin agreed to meet these terms in a number of weeks, as soon as he could make the arrangements.

When the victorious Crusaders took possession of the city, they found much destruction and desecration of the churches. The *Itinerarium* reports:

> The state of the churches inside the city was horrible to behold, and even now it is distressing to remember the shocking things seen within them. For which of the faithful could gaze dry-eyed on the face of a venerable image of God's Son Himself crucified, or of some saint, which had been disfigured or dishonoured in some way? Who would not shudder at the horrific description of how that impious Turkish people abusively destroyed altars, and threw holy crosses on the ground, and beat them in contempt: they set up their mosques in places of sanctity, and having removed all signs of human redemption and the Christian religion, put in all the filth of their Muslim superstition.[143]

There had clearly been substantial losses of works of art and much damage done to the many churches in the city when they had been turned into mosques. The art destroyed, defaced, or damaged included images of the Crucifixion and the saints, crucifixes, altar crosses, and altars. When the cleansing and reconsecration of these churches was completed, the redecoration could begin while the Crusaders turned to other matters.[144]

Philippe and Richard took the main positions in Acre, in the royal castle and the Templar fortress, respectively, and divided the city between them, according to a mutual agreement they had reached in Messina in the winter of 1190, turning aside the claim of Leopold, duke of Austria, as leader of the German contingent. Then they faced the problem of arbitrating the claims of Guy and Conrad over the kingship of Jerusalem. King Philippe supported the cause of Conrad, whereas Richard had received Guy de Lusignan in Limassol in May 1191 and heard his claims sympathetically from that time.[145] After much debate the following was agreed on: Guy would remain king until his death, and Conrad would have rights to Tyre and to Beirut and Sidon when they were retaken. Guy and Conrad would share the royal revenues equally. At the death of Guy, Conrad and Isabella would take the throne.[146]

At this point, King Philippe announced his intention to turn over his portion of Acre and his share of the hostages to Conrad and to return home, leaving Duke Hugh of Burgundy to command the French troops. Richard was dismayed, but he could not dissuade Philippe from this plan. Promising Richard he would not attack his lands until Richard returned home, Philippe sailed for Tyre with Conrad on 31 July, and then sailed for Brindisi three days later. On reaching Italy, the king went to Rome, where the pope, Celestine III, showed him a precious relic-image, the "Veronica" of St. Peter's. This is perhaps the earliest recorded reference to this famous object in Rome, partly destroyed or stolen later in 1527 during the sack of Rome.[147] What irony that during the expedition of Philippe II Augustus, the only major relic-image that he is associated with is not found in the Holy Land, but, on his return from the Crusade, in Rome!

Richard was now in sole command in Acre, and he turned to the task of getting Saladin to honor the surrender treaty while he personally supervised the Crusaders as they began rebuilding the damaged walls of Acre. "King Richard was applying his attention to repairing the walls of the city so that they were higher and better than they had been before they were destroyed. He himself walked up and down constantly, encouraging the workers and giving instructions to the masons."[148] No one discusses the construction of the fortifications in any detail at this point, however, but it appears that the defenses in 1191 still consisted of a single wall and that Montmusard, the northern suburb, was still unenclosed by any fortifications.[149] The description of Acre in the *Itinerarium* is brief and says little about the walls:

> The city is triangular in shape: narrower on the west, more extended on the east. More than a third of its perimeter, on the south and west, is enclosed by the flowing waves.... There is... a tower called the Cursed Tower, which is situated on the wall which surrounds the city. A city called Ptolemais was formerly situated on top of Mount Turon [east of the Crusader city].
>
> The river which flows to the city is called the Belus [which empties into the Bay of Acre just southeast of the Crusader city and south of Turon]. Not far from the river they point out a low rock near the city, where they say the three parts of the world, Asia, Europe and Africa, all meet.[150]

Work on the walls was carried out with all deliberate speed. Negotiations with Saladin dragged on, however. A month passed and Saladin only offered to produce a partial installment on the money and the prisoners to be handed over. Richard sought the help of Conrad in Tyre to assist with the process, but Conrad would not come. Furthermore "he boasted that if and when the True Cross was received he would take half of it on the king of France's behalf and he would not give up the hostages until this was done."[151] Saladin was said to have the relic of the True Cross in his camp, and Crusader envoys were said to have seen it along with half of the money to be paid and all the prisoners except for some of the named captives who were not present.[152] When this was offered, Richard would not accept this as a valid instalment and release the sultan's men held as hostages; Saladin proposed to leave other hostages for the missing prisoners. Neither leader trusted the other and the process broke down. It is evident here that the Crusaders were extremely anxious to recover the relic of the True Cross, which had been lost at the battle of Hattin,[153] as the account in the *Itinerarium* makes clear.[154] Jacques of Vitry, writing later in the 1220s, said somewhat cynically, "they promised to give back the holy cross, which the Christians had lost in battle [at Hattin]. But as they could not find it, the King of England flew into a rage."[155] Had Saladin at least returned the holy relic, the surrender treaty could probably have been kept alive. The relic of the True Cross was clearly a major concern of the Crusaders.

As it was, after consulting with his advisors, Richard determined that Saladin would not honor the terms of the surrender after all. He therefore ordered the Muslim hostages to be marched out of the city and killed, in full view of Saladin's army.[156] This cold-blooded murder by the famous Crusader Richard would never be forgotten by the Muslims. In the face of this massacre, Saladin may have decided that the relic of the True Cross captured at Hattin would never be returned.

Richard was anxious to start his march to Jerusalem, which was of course his real objective. Two days after the massacre, on 22 August, he led his army out of Acre and headed south. This campaign would demonstrate his military prowess and regain territory for the Latin Kingdom along the coast, but it would also reveal serious weaknesses in the Crusade and ultimately, Richard was doomed to fail in his attempt to recapture Jerusalem. This campaign would also produce heavy destruction on fortifications in the path of the Crusader army. Jacques de Vitry reports in general: "When Saladin saw that the city [Acre] was taken, and a great part of his force destroyed, being greatly cast down, and having no hope of defending the other cities against us, he destroyed the walls of the cities by the sea, that is to say, of Porphyria [Haifa], Caesarea, Joppa, Ascalon, Gaza, and Darum."[157] How and when did this happen?

When Richard and the Crusader army marched southward, his first objective was Jaffa, to be used as the jump-off point for an assault on Jerusalem. After passing Haifa and rounding the point of Mount Carmel, the first major city on the coast was Caesarea. The Crusaders advanced in a compact, well-defended formation, with a fleet of ships along the coast to protect and supply the army from the sea. The *Itinerarium* author described the scene:

> There were "men-at-arms of much prowess and boldness, most becoming armour, so many pennants with fluttering flags and banners of many different shapes, so many white-tipped spears, gleaming mailshirts and helmets. It was an army terrible to the enemy, drawn up in battle-array...
>
> King Richard led the vanguard.... The Normans guarded the Standard. The "Standard" was a very long beam like a ship's mast placed on very solid planks on top of four wheels, held together by joints. It is covered with iron and appears invulnerable to sword, axe or fire. From the very top flutters the king's flag, which is commonly called the 'banner'. It is the custom to assign a force of elite knights to protect this implement,.... While the emblem remains erect the people have a sure refuge to which they can run;.... So it stands, strongly constructed "to rally the peoples."[158]

The Muslims attacked the Crusaders every day; progress was slow in any case to accommodate the foot soldiers in the heat and to coordinate the movement of the fleet with the soldiers on land. Saladin decided not to attempt a major battle with the Christians at Caesarea, so he ordered that the defenses there be dismantled before the Crusaders arrived on 30 August.[159] The *Itinerarium* reports that Saladin "partly demolished the walls and towers and destroyed as much of the city as possible."[160]

Farther south, on a plain just north of Arsur [Arsuf],[161] midway between Caesarea and Jaffa, Saladin determined to test the Crusaders with a full attack. On 7 September all through the heat of the day the battle raged. At the end of the day, the two armies fell back exhausted, but the Crusaders held the field. It was the first Crusader victory in open combat over Saladin since Hattin. Saladin was very angry. He ordered his brother as follows:

> Go without delay and have the walls and towers of Ascalon[162] razed to the ground; also the city of Gaza;[163] but entrust Darum[164] to a garrison to defend it so that my people can pass through that way. Have Galatia[165] and Blanchegarde,[166] Joppa,[167] and the Casal of the Plains[168] and Casal Maen,[169] St. George[170] and Ramula[171] and Belmont,[172] Toron,[173] Castle Ernald,[174] Beauvoir[175] and Mirabel[176] destroyed. Also, smash down all the mountain fortresses. May your eye spare neither city, castle nor casal. Destroy everything, throw everything down, except for Crac[177] and Jerusalem.[178]

Baha ad-Din describes the situation at Ascalon: Saladin

> assigned a certain portion of the ramparts to each group of labourers; the task of destroying a curtain and tower was also

> given to each emir and company of soldiers.[179] The work was difficult, because of the strength and thickness of the walls. They mined the walls and set fire to the wood supports so the walls would collapse; they packed the towers with wood and set them on fire, to soften the stone, so they could pull them down. Saladin and his men devoted about two weeks to this demolition.[180]

The first elements of the Crusader army reached Jaffa on 10 September and found the city completely destroyed, so they pitched their tents in an olive grove. When Richard arrived with the cavalry and the fleet, a council was held on how to proceed. They decided to stay in Jaffa and start repairs to the city and its walls immediately.[181] While the Crusaders were in Jaffa from 10 September to the end of October, Richard went to Acre to try to persuade Conrad of Montferrat to join the army.

In the beginning of November the Crusaders marched to Casal of the Plains and Casal Maen. Men of the army rebuilt Casal Maen [Bait Dajan] "to perfection" while the Templars rebuilt Casal of the Plains [Yazur], all in fifteen days.[182] Meanwhile envoys were sent from Richard and from Conrad to Saladin's brother, Saif ad-din, in an effort to negotiate the return of Jerusalem and the relic of the True Cross. Gifts were exchanged – Saif ad-Din sent seven camels and a handsome tent to Richard on one occasion – and there was much discussion; Richard and Saif ad-Din even dined together at Lydda.[183] Meanwhile there was only desultory fighting between the Crusaders and the Muslims. Eventually Richard moved his army up to a position between Ramla and Lydda where they camped for six weeks. The rainy season had started. The army wished to move on to Jerusalem.

When Saladin perceived that the Crusaders intended to march toward Jerusalem, he had the walls and towers of Latrun dismantled and then he retired to the Holy City. The Crusaders advanced to Beit Nuba just northeast of Latrun and Castellum Arnaldi in heavy rain. In early January 1192, a council was held. The Hospitallers, Templars, and resident Crusaders argued that it would be better to consolidate their position along the coast, rescue Ascalon and rebuild its defenses first, before attempting to attack Jerusalem.[184] Even if Richard's army could take Jerusalem, they argued, who would defend the Holy City against Saladin's reinforced army when the majority of the Crusaders returned home after visiting the Holy Sepulchre? In the face of reality, Richard was forced to agree. This decision was nonetheless very unpopular, many soldiers despaired of seeing Jerusalem, but the weather was terrible, and there was mud everywhere. Richard led the march to Ascalon arriving on 20 January. A large contingent of French troops refused to come and camped at Ramla. Morale in the Crusader army was very low.

When the Crusaders arrived at Ascalon, "they found that it had been so completely razed to the ground by the Saracens that it was only with great effort that they were able to get in through the gates over the heaps of stones."[185] Richard was eventually able to persuade the French contingent to rejoin the army in February. Meanwhile work had begun on the walls.

> They threw out a heap of broken stone and dug down deeply, searching for the foundations of one of the greater gates, until they hit solid masonry. You would have seen everyone working together, chiefs, nobles, knights, squire, and men-at-arms passing stones and rocks from hand to hand. There was no distinction between clergy and laity, noble and commoner, servants and princes. All laboured equally together... and so in a short time they made so much progress that even the workers themselves were impressed....
>
> When they had brought in skilled masons the work grew more rapidly. The king played a prominent part in the work as he did in all his operations. By building with his own hands, urging others on and distributing money he helped the work to advance more effectively. On his encouragement, each of the chiefs and magnates took on responsibility for completing a part of the building, each according to their means. If any of them abandoned the work because of their lack of money, the noble-minded king, whose heart was greater than his rank, would bestow on them whatever they needed from his own resources. So the work advanced . . . through his efforts and expense that it was said that he was responsible for completing the rebuilding of three quarters of the city.[186]

An important inscription found at Ascalon corroborates the description of the work at Ascalon in the *Itinerarium* and adds certain information to our knowledge of the work there. The inscription reads: "Master Philip, (clerk) of the Chamber of King (Richard) of England, made this (work of fortification from) gate to gate."[187]

Pringle identifies and describes Master Philip: he was

> King Richard I's clerk,... a native of Poitiers, of which, in 1189, Richard was overlord both as Count of Poitou and as Duke of Aquitaine. In the same year that Richard ascended the throne of England, Philip accompanied him on his Crusade and, in 1191 witnessed his marriage with Berengaria of Navarre at Limassol in Cyprus.
>
> The... inscription therefore confirm[s] the chronicle evidence cited already, which states that most of the rebuilding done at Ascalon was paid for by Richard himself. As clerk of the Chamber, Master Philip was evidently the official responsible to the King for overseeing the work, for paying the professional masons and for buying the materials. In other words, he would have acted as clerk of the works. The text thus provides us with some further insights into... how the building of defensive works was organized. Indeed, the setting up of the text itself may be seen as an administrative act; and, just as in Roman and Byzantine administrative practice it was invariably a civil rather than a military official who was responsible for organizing the building of town walls and who normally set up the inscription(s) recording the fact, so too in this text the clerk's name is given a more exalted position even than the King's. There can be no doubt, however, that the clerk was acting in the King's name and not on his own responsibility.
>
> Another detail in which the inscription supports the evidence of the chronicles is in indicating that the town wall was divided into sectors, each of which was completed by a different person. If by *porta(e)* the text means the main gate(s) of the town, then, following William of Tyre's description, the King's sector recorded here would have taken up about one-quarter of the whole enceinte. At the time of the Third Crusade, it was not only the Franks who made use of such methods. The Muslims used the same system both for building and, as we have seen, for destroying town walls. At the same time that Richard was rebuilding the walls of Ascalon, Saladin was also strengthening the defences of Jerusalem, sharing the work out between his emirs.[188]

Pringle goes on to identify the typical characteristics of this phase of the construction of the walls visible in the archaeological evidence. Richard's walls are characterized by their narrow courses, smooth ashlar facing, brown or cream mortared rubble fill, and the use of antique marble or granite columns built through the walls.[189] Certain remains of Richard's walls are still visible in the ruins of the city today.[190]

Work went on for five months, January to May 1192. It was clearly more difficult and time-consuming to rebuild the walls than it had been to destroy them. But Richard understood the strategic importance of Ascalon and intended that by reestablishing this bastion, the Crusaders could protect the Kingdom from Muslim invasions from the south.

While the rebuilding of Ascalon was in progress, Richard was continuing negotiations with Saladin and his brother in an effort to reach a settlement,[191] and he sought to quell fighting between the Pisans, partisans of Guy, with the Genoese, who supported Conrad, at Acre. Meanwhile Richard received a disturbing report about developments in England and his chancellor urged him to come home at once. He could see that his time was short, and he needed to attend to certain responsibilities before he left the Holy Land.

Shortly after Easter, 5 April 1192,[192] Richard called a council to resolve the issue of who was to be king of Jerusalem.[193] When those present at the council surprisingly voted unanimously for Conrad, Richard had no choice but to agree, despite the difficulties he had had in getting Conrad to aid the cause of the Crusade expedition. Richard sent Count Henry of Champagne as his official envoy to inform Conrad of the decision and to extend his recognition of Conrad as king-elect. Conrad received the news with joy and preparations were begun for the coronation in Tyre.[194] But the coronation would never take place.

On 28 April Conrad was assassinated in Tyre by two Muslims sent by Sheik Sinan, the "Old Man of the Mountain." Isabel, who had an infant daughter, Maria, was understandably distraught, and she sought the counsel of King Richard on how to proceed. Meanwhile, Count Henry, who had heard the news in Acre, returned to Tyre where the people of the city immediately proclaimed him to be the leader they wanted to marry Isabel and wear the crown of the kingdom. Clearly, no one wanted Guy de Lusignan.[195] Henry also sought the advice of Richard. Richard, too, was stunned at the news of Conrad's death, but he was pleased that his nephew had been chosen to be king of Jerusalem. Richard gave his assent. Isabel agreed to marry Henry and the ceremony was celebrated in Tyre with unseemly dispatch on 5 May 1192. Despite the irregularities of its arrangement, it turned out to be a happy marriage for Isabel and Henry, but Henry would never be crowned king; he ruled as Isabel's husband.[196]

Meanwhile, during the maneuvering over the kingship of Jerusalem, Richard saw to it that the ill-fated Guy de Lusignan was not forgotten. Richard had been impressed with Guy since the time they met on Cyprus in May 1191. In the face of a Greek revolt on Cyprus in early April 1192, the Templars, who bought and briefly held Cyprus after his conquest, had sold the island back to the king. Now Richard sold it to Guy.[197] Hence, Guy de Lusignan, who could not reclaim his position as king of Jerusalem following the debacle of Hattin, established the Lusignan dynasty on Cyprus, a dynasty that would remain in power for nearly three hundred years, long after Acre and the Latin Kingdom had fallen in 1291.

Following his return to Ascalon after the consultations surrounding the royal arrangements for Isabel and Henry, Richard decided to attack Darum south of Gaza. In a brief campaign Richard took the fortress on 22 May 1192 after mining the walls and towers. Count Henry arrived two days later, on Pentecost, and Richard formally turned the castle over to him.

At this point, Richard was forced to decide whether to depart for England, from where more disturbing news had just arrived, or to make one more attempt to take Jerusalem. A Poitevin preacher named William reminded Richard of all his exploits and conquests to date. "Having begun so brilliantly, do not allow a swift retreat to obscure the glory you have won so far; let it not be said against you in the future that you made a cowardly retreat leaving unfinished business."[198] Richard decided to stay and ordered his army to prepare once again to march toward Jerusalem.

The army set out on 7 June 1192 and by the 10th they arrived for a second time at Beit Nuba. While supplies were being brought up, the Syrian bishop of Lydda came to pay homage to Richard bringing him a relic of the True Cross.[199] Shortly after this, the abbot of Mar Elias also came to Richard. He told him of how he had saved a fragment of the True Cross from Saladin by burying it in the ground. Now he took the king to that place where they recovered this holy relic and brought it back to the army. "There the people adored it with the greatest devotion, eagerly kissing it and weeping many pious tears."[200] Clearly the Crusaders still sought and revered the relics of the True Cross with the greatest fervor.

Once again the king hesitated and called a council to discuss strategy, in particular whether to attack Jerusalem. A group of advisors, the majority of whom were resident Crusaders, proposed that it would be wiser to march into Egypt and attack the Muslims there. While this discussion was underway, Richard was informed that a huge supply caravan, lightly guarded, was on its way to Jerusalem from the south bringing provisions to Saladin. Richard attacked and captured the caravan southwest of Hebron and seized enormous booty. Saladin was horrified and braced for an immediate attack on Jerusalem. But when Richard returned to Beit Nuba, surprisingly the decision was made once again not to attempt an assault on the Holy City. As had been the case in January, arguments based on caution attributed to the Hospitallers, Templars, and resident Crusaders won the day. There were fears of a lack of water, their inability to protect vital supply lines, and too few soldiers willing to stay in the city to defend Jerusalem against a relieving army. Despite his professed goal of retaking Jerusalem, Richard again backed down at the brink of victory. Again, a majority of the members of the army were personally devastated; here they were only a few miles from the Holy City and the attack was called off. Richard's surprising caution here makes clear the strong influence which the resident Crusaders, especially the Hospitallers and the Templars, had in the decision-making process.

The king sounded the retreat on 4 July, but his army was dispirited and some men went back to Jaffa on their own. Richard attempted to open negotiations with Saif ad-Din for a treaty, continuing the long-standing negotiations with Saladin, but to no avail. With this response, Richard ordered the fortress of Darum to be razed and Ascalon to be further strengthened;

meanwhile he returned to Acre to prepare to depart for the West. With this reprieve, Saladin seized the initiative and sent a strong force to attack Jaffa. Richard was forced to sail to Jaffa to save the city. In a famous incident, upon his arrival,

> with no armour on his legs he threw himself into the sea first, up to his groin, and forced his way powerfully on to dry land. The first and next after the king were Geoffrey du Bois and Peter des Préaux. All the rest followed them, jumping into the sea and advancing on foot. They boldly attacked the Turks who obstinately opposed them,.... The outstanding king shot them down indiscriminately with a crossbow he was carrying in his hand, and his elite companions pursued the Turks as they fled across the beach, cutting them down.[201]

With this gallant action and other feats of derring-do, Richard secured Jaffa from the Muslims, and he ordered that its fortifications be repaired at once. Exhausted by his exertions, however, Richard again fell ill. Now he was forced to seek and obtain a truce with Saladin. On the one hand, Saladin agreed to let Christian pilgrims have safe and free access to the holy sites. Also commerce was to be exercised freely through the whole country. He also agreed that the Crusaders would hold the territory south from Acre to Jaffa. (Map 2) But one of the terms was onerous and demeaning: Ascalon was to be returned to the Muslims and its fortifications, only recently rebuilt by the Crusaders after four months of hard work, were to be demolished once again. Richard wanted to refuse this, but he was powerless to resist and had to accept this bitter pill. The truce went into effect on 2 September 1192 and would be in effect for three years and eight months. It is referred to as the Treaty of Jaffa. The relic of the True Cross was not mentioned, nor was it ever returned by Saladin to the Crusaders.[202]

Those Crusaders who were prevented from marching to the Holy City and fulfilling their vow by conquest, were now allowed to go as unarmed pilgrims. Richard himself could not or would not go, and he put one stipulation on these arrangements. The French soldiers who had been so unruly and opposed to or thwarted his commands, were not to be allowed to make this pilgrimage. The three parties who did make the pilgrimage were led by Andrew de Chavigny, Ralph Teissel, and Hubert Walter, bishop of Salisbury. The pilgrims in all three parties were allowed to visit the holy places in Jerusalem and they were shown the relic of the True Cross and were allowed to kiss and adore it.[203] Saladin showed much honor to the bishop and when his visit was nearly finished, he said that the bishop might ask him for whatever gift he most desired and it would be granted to him. The bishop did not ask for the return of the relic of the True Cross lost at Hattin; rather he asked that two Latin priests and two deacons be allowed to celebrate the liturgy at the Holy Sepulcher, at the Church of the Nativity in Bethlehem, and at the Church of the Annunciation in Nazareth. Saladin granted his request.[204]

Returning to Acre, the pilgrims made preparations to return home. On 29 September, Queens Berengaria and Joanna of Sicily set sail. Richard followed on 9 October, but was shipwrecked, captured by Leopold of Austria, and turned over to the Hohenstaufen emperor, Henry VI, who extracted a huge ransom for his release. Thus ended the Third Crusade on another unpredictable note of Christian animosity against Christian. This expedition had clearly been much more successful than the Second Crusade: the Latin Kingdom of Jerusalem had been reestablished, even if Jerusalem and the other major holy sites had not been captured. But omens of future trouble and decline could clearly be seen in the political dissension and fighting among the resident Crusaders, in the inability of the Western Crusade leaders to overcome dangerous factionalism in the name of the Crusader cause, and in the weakness of the Latin king.

Pilgrimage and "The Condition of the City of Jerusalem"

Ironically, the Third Crusade never attempted a direct attack on Jerusalem, but Jerusalem was in fact the last place visited on pilgrimage by soldiers who had been on the Crusade before they set out to return home. Although there is no independent pilgrimage account per se in these years, that is, 1187 into the 1190s and early thirteenth century, the accounts of the pilgrims' visits to Jerusalem in the *Itinerarium* and in the account by Ambroise include certain descriptive references to the Holy City.

In the *Itinerarium*, those in the second party of three groups of pilgrims have their visit described in the most detail. They went first to the Church of the Holy Sepulcher where they reportedly saw the relic of the True Cross that Saladin had captured at Hattin. At the aedicule of the Holy Sepulcher they saw French and Syrian prisoners at work, and some offerings were given directly to them rather than being left at the tomb only to be taken away by the Muslims for their own use. They also saw the Calvary chapel and the cracked stone in which Jesus' cross had been fixed. Leaving the Church of the Holy Sepulcher, the pilgrims went south across town to the Church of St. Mary, Mount Sion, and the place of the Assumption. They also went to the Coenaculum to see the table of the Last Supper. Leaving the southwest corner of the city, the pilgrims went into the Kidron Valley to see the Tomb of the Virgin Mary. Finally,

> we went up into that vaulted room in which it is said that our Lord and Redeemer was held for the night, awaiting his crucifixion on the morrow. We poured out pious tears there and placed affectionate kisses on the place. Then as the Turks were throwing us out we left quickly. We felt great pain at the pollution profaning the holy places because of the horses which infidel Turks had irreverently stabled there.[205]

This appears to mean that as they were leaving, the pilgrims returned into the city to one of the places where, tradition said, Jesus had been held before his crucifixion.

These holy sites in Jerusalem in the *Itinerarium* correspond more or less exactly to the route Ambroise describes on his pilgrimage visit at this time. Ambroise seems to have been in the second party as well, and he identifies himself as one of the pilgrims on foot, not on horseback. Ambroise adds that the Church of St. Mary, Mount Sion, "all defaced it lies, and ruined and laid waste."[206] This is apparently a very up-to-date account of the condition of this venerable church as a result of the 1187 conquest.

Along with these comments on pilgrimage to Jerusalem in the early 1190s, we also have the important and informative text known as "L'Estat de la cité de Jérusalem," "La Citez de

Jérusalem, the "The City of Jerusalem," or "The condition of the City of Jerusalem."

The preface to this text says, "As most good Christians are glad to talk and hear about the holy city of Jerusalem and the holy places where Our Lord died and lived, we will tell you what it was like on the day Saladin and the Saracens took it from the Christians," that is, 2 October 1187.[207] This text appears today in manuscripts of the chronicle of Ernoul, indeed in all the manuscripts of the short continuations to William of Tyre's *History* up to *c.*1229, and it is placed in the narrative just before the account of the siege of Jerusalem by Saladin.[208] It also appears in the Rothelin Continuation of the *History of Outremer* by William of Tyre, inserted at the year 1229, and in the *Assises de Jerusalem*, both texts that were written well after 1187 (or 1229), despite retaining almost the same prefatory sentences referring to October 1187 for the "City of Jerusalem."[209] Even though the L'Estat as we know it is found in these narrative chronicles, however, it is possible, even likely, that it began its existence as an independent text to guide pilgrims to the various pilgrimage sites in and around Jerusalem. Versions of this text were translated in the Palestine Pilgrims Text Society publications by C. R. Conder, and more recently by Janet Shirley.[210]

The author(s) of this description of Jerusalem is not known, neither the original author nor those who later on revised the text. The text functions in two ways: on the one hand, it is a kind of commemoration of the Holy City in the long period when Christian access was often severely restricted, that is, from 1187 to 1229, for those texts that continue William of Tyre's *History* up to *c.*1231.[211] On the other hand, the text serves as an introduction to Jerusalem for those continuations that recount the story of the Crusader Kingdom up into the 1240s, the 1260s, or the 1270s.[212]

"The City of Jerusalem" begins its description on Mount Sion with the Church of St. Mary and the Augustinian monastery; it refers to the holy places of the Last Supper, the upper room where Christ appeared to the apostles and to St. Thomas after Easter and at Pentecost, and the place where the Virgin Mary died. Unlike the account of Ambroise, it makes no mention of damage to the Church of St. Mary.

Then the text addresses the four main gates of the city and the streets that ran from those gates with major sites located on them. There was the gate of David (Jaffa Gate) on the west side, the Golden Gate on the east side, St. Stephen's Gate (the Damascus Gate) on the north, and the Gate of Mount Sion on the south. The author provides a combination of material on the holy sites and information about what the visitor will see when entering from each of these gates. The author also mentions other, less important gates, including the Gate of Jehosaphat (the Lion Gate, or the Gate of St. Stephen today), the Lazarus postern gate (east of what is today the New Gate), and the Tannery postern gate (the Dung Gate). In the process of discussing these gates the author also describes certain abbeys and churches outside the walls of Jerusalem, but the author concludes by noting that only those churches and abbeys with congregations that are in communication with Rome are included, that is, primarily Frankish establishments.

"The City of Jerusalem" can be seen as having an ecclesiastical focus, and it does have some of the stories and lore of the sites, but it is clearly different from earlier pilgrim's accounts, such as those by John of Würzburg or Theodorich. In organization it is somewhat different from the biblical – main holy sites, or pilgrimage route sequencing of the earlier pilgrims, although the main holy sites are still focal points of discussion.[213] By approaching the Holy City in terms of the main gates, the principal streets running from those gates and the primary sites found on those streets, the text takes on more of the character of a guidebook. Whereas the text deals mainly with the situation of Jerusalem under Crusader control before Saladin's conquest as indicated in the preface, it also has some comments on current conditions, that is, after the conquest. All of it is aimed at Frankish pilgrims, with certain important practical material including information on markets and accommodations as well. Because the author describes the city with reference to streets leading in from each of the four main gates, there is some repetition in regard to references to certain important sites, but the text is quite informative nonetheless.

The author begins by locating Jerusalem and telling us that it is now, in 1187, not situated as it was when Jesus was crucified. In the time of Jesus, Jerusalem was located more on Mount Sion and the sites of Calvary and the Holy Sepulcher were outside the city walls. After describing what can be seen on Mount Sion, the author starts with the Gate of David on the west side. The main streets mentioned are Mount Sion Street, David Street, and Patriarch Street. The author refers to the Dome of the Rock as the Templum Domini, indicating that it was Crusader Jerusalem being described, not Ayyubid or Muslim Jerusalem. Furthermore, when St. James Church is mentioned, there is no reference to the Armenians, for reasons the author gives later, and the saint is identified as St. James of Galicia, referring to his great pilgrimage site at Compostela. The food markets are described off David Street and the Exchange: the corn market; the vegetable, fruit, and spice market; the fish, cheese, and fowl market. The shops of the palmers, who sold palm fronds to pilgrims, and of the Syrian and the Latin goldsmiths, are also specified, alongside the Convent of St. Mary Major, the Monastery of St. Mary Latin, and the hospital.

Only then are we introduced to the first main holy site, the Church of the Holy Sepulcher. Although the Church of the Holy Sepulcher receives a whole section of the text, the description is in fact quite cursory, but there is some interesting terminology. The entry from the parvis in front of the south transept portal is described in some detail. There are three entrances from the south: the main entry (no indication is given that one of the two main doors was walled up), the entry up the stairs to the right and into the Calvary chapel, and the entry to the left through the Holy Trinity Chapel. The Holy Trinity Chapel is noted as having become a popular place for weddings, and children were baptized there. The aedicule of the Holy Sepulcher stood directly inside the church from this chapel; it is a structure this text refers to as the "Monument." At the east end of the church was the apse with an altar called the "Cavet."[214] It is interesting that the author uses both the word "chevez" and a special word for an altar in the chevet, the "Cavet." Between the monument and the choir was an altar where the Greeks sang their liturgy, set off by a partition, and there was a lectern called the Compass where the canons read the epistle. In earlier pilgrims' accounts, the Compass was described as the center of the world, but this author omits any such reference,[215] nor is there any mention of the True Cross Chapel of the Syrians.[216] Also accessible from the east end were the Crusader canon's cloister, and the Chapel of St. Helen, where the cross, nails, hammer, and the crown of thorns of Jesus were found, according to this author. Unfortunately this text omits any reference to the figural imagery of the mosaics or the inscriptions found in the Church of the Holy Sepulcher, mentioned by certain earlier pilgrims, especially John of Würzburg and Theodorich.

The next section of the text refers to markets for cooked food, on the ominous-sounding Malquisinat Street, and for cloth and clothing, both in vaulted streets off the Exchange. Then there is a long description on the Temple, the second of the major holy sites. Here again the Crusader terminology was used: the Temple of Solomon is identified as where the brothers of the Temple, that is, the Templars, lived. The Dome of the Rock is called the Templum Domini, and the quarters of the Augustinian canons is referred to as to the left, that is, to the north of the Templum Domini. The author also refers to the Golden Gate and how the Crusaders opened it only twice a year: once for the Palm Sunday procession and once for the Feast of the Holy Cross on 14 September. This section is striking in referring to the conditions of Crusader Jerusalem before Saladin "cleansed" the Frankish buildings and artistic decoration on the Haram al Sharif following his capture of the city.

In the next part of the text, the author describes the region related to the northern gate, called St. Stephen's Gate. Outside of this gate was the traditional site of St. Stephen's stoning and the church marking the place, which was pulled down before Saladin's siege because it was close to the walls. But also here was found the "Asnerie," that is, the stable for pack animals used by the Hospitallers. The Asnerie was not demolished, however, "and afterwards it was, in fact, essential to visiting Christians, who paid to enter Jerusalem when the city was under Saracen control, because they [the Muslims] would never let them reside within the city."[217] Thus the author of this part makes clear that he (or she) is writing after Saladin's conquest in 1187, when Christians were allowed to come to Jerusalem under terms of a truce (e.g., after the Treaty of Jaffa in 1192) for three years and eight months, or even later. Because the Muslims would not let Christians stay inside the city while they were in control, pilgrims could find accommodations at the Asnerie. The author then goes on to give further details about how Christians coming to Muslim Jerusalem would be treated: they would have to come to the Holy Sepulcher by the postern gate of St. Lazarus, and they would have to pay the Muslims to visit the holy sites. This section makes clear that even if the basic text was written in 1187 just before Saladin's siege, there were later emendations that refer to the period between 1187 and 1229. What is surprising, perhaps, is that there are not more of these emendations in the main text of the L'Estat, to account for the numerous important changes that the Muslims effected in Jerusalem in 1187 and the years following. This indicates rather strikingly that the author wished this text to reflect Crusader Jerusalem primarily as it was during the time they controlled it, not as it was after 1187 in Muslim hands.

The remaining portions of the text describe the streets and the gates as yet not discussed, along with important sites outside the city walls. There is, for example, an unusually long passage on the Georgian Monastery of the Holy Cross to the west of the David Gate, where a relic of the True Cross was located, and the author tells an unusual conglomeration of stories about the wood of the Cross. One of the stories relates how the head of Adam is related to the cross of Christ. "In memory of this all the crucifixes made in the land of Jerusalem have a head placed at the foot of the cross."[218]

The sites related to the Tannery postern gate and the gate of Jehosaphat are also described. The Jewish quarter is described as being in the northeast section of the city, north of the Church of St. Anne adjacent to the street of Jehosaphat. Many Syrians are also cited as living in that quarter. Along the street of Jehosaphat is also located "the church of Rest; there it was said, Our Lord Jesus Christ rested as he was being led to crucifixion. There too was the prison where he was held the night he was apprehended in Gethsemane."[219]

Outside the gate of Jehosaphat, the text locates the Tomb of the Virgin. In Crusader times there was a Benedictine abbey with a church and the Tomb inside the church.[220] The author notes that when the Muslims took the city the abbey was demolished, but the church and the Tomb were untouched. In fact the text mentions a number of holy sites in Gethsemane, on the Mount of Olives and at Bethany and Bethpage. It is therefore quite surprising that the place of the Ascension, a major holy site in earlier pilgrims' accounts, is not mentioned by name other than to say, "On Mount Olivet was an abbey of white monks."[221]

Finally, the author concludes this basic description of Jerusalem by saying,

> Now I have told you the names of the abbeys and churches of Jerusalem outside the city, and of those in the streets of the Latins, but I have said nothing at all about the abbeys and churches of the Syrians, nor of the Greeks, Jacobites, Bedouin, Nestorians, Armenians, or any of the other peoples who had churches and abbeys in the city but were not of the Roman obediance. The reason I have no intention of telling you about all these people just mentioned is that they are said never in any way to have accepted obediance to Rome.[222]

This is a striking passage because it voices a strong multicultural awareness on the part of this author. John of Würzburg had concluded his pilgrim's account *c.*1170 with a similar, if not even more remarkable, catalogue of the many Christian peoples in Jerusalem. The parallelism of the two passages strongly suggests that whoever was the author of the "City of Jerusalem," he or she was also a Crusader pilgrim from the West, possibly one who had visited Jerusalem shortly before Saladin's conquest. The presence of the special details pertaining to Christian pilgrimage visits between 1187 and 1229 indicates that later the same author returned, or another pilgrim came to Jerusalem, and added these emendations.

As we shall see,[223] additions to this basic text continued to be made later, perhaps during a period of truce between the Crusaders and the Muslims. Thus even if the original author had not returned after October 1187, at least a later author incorporated certain selected reports on the conditions a pilgrim would face in making a pilgrimage at that time, when the Holy City was in the hands of the Muslims. Whoever the original author was, the fact is that when a description of Jerusalem was needed, versions of this text are used for all the different versions of the continuations of William of Tyre's *History*. It was a special text apparently generated at the time of Saladin's invasion of the Latin Kingdom that was then recycled for later use, "immobilized" to a certain extent like certain coins of the realm after 1187, but revised from time to time.

Crusader Manuscripts at the Time of the Third Crusade

"The Condition of the City of Jerusalem" is a text that provides us with direct knowledge of the Holy City in the year 1187, but it does not survive from a known manuscript written in that year.[224] In fact the earliest codex that contains this important description dates only much later, in the thirteenth century. The only manuscripts known to me which are directly related to this period, specifically to the year 1191, are in fact parchments that refer to financial records transacted during the course of the Third Crusade. Although they are undecorated, and thus not examples in themselves of artistic work to take note of directly, they are valuable nonetheless for what they tell us of Crusader life at the time of the Third Crusade.

The "Acre Archive" came on the market in London in 1987.[225] At that time Sotheby's put up twenty-five documents written on vellum that pertained to financial arrangements, mostly made during the siege of Acre. The catalogue describes the documents as follows:

> Twenty-five documents varying in size from c. 59 mm. by 130 mm. to 225 mm. by 185 mm., written on vellum of inconsistent quality but generally Italianate in appearance, written in various dark brown inks in a variety of European late romanesque charter hands, some with flourished initials, mostly with folded plica at foot, some with seal tags and several with coloured threads for pendant seals, no seals remaining, some with contemporary endorsements of the names of the issuers or the sums of money involved, all with seventeenth- or possibly eighteenth-century endorsements and filing classification in an Italian hand, all with at least one (and sometimes up to three) nineteenth-century filing numbers on dorses, some with stains, some creased in folds and elsewhere, some (including that of Philip Augustus) rather faded, generally in fine condition.[226]

Most of these documents provide a fascinating example of the interactive commerce that went on between merchants from the Italian maritime cities, chiefly Genoa, and the members of the Third Crusade. They all give us a glimpse of the context in which the Crusaders lived and worked, and in which they also, of course, commissioned works of art in other circumstances. Because these documents are unstudied and they need to be checked carefully to be certain no forgeries are contained among them, I can only make a few preliminary observations about what they apparently contain. Following are the names and transactions recorded from a small selection of the documents:

1. Philip de Dreux, bishop of Beauvais, stands surety for 100 silver marks borrowed from Waleran de Casanova, citizen of Pisa, by Nicholas de Chambli, Hugh de Mosseio, Peter de Follosia, and Hugh de Franssureis, dated "in castris iuxta accon," 1191.
8. Radulphus, lord of Coucy, stands surety for 100 silver marks borrowed from Giovanni de Rosio and associates, merchants of Genoa, by William de Farmers, Radulphus de Fossatis, Radulphus de Cozeta, Hugh de Rosseo, and Peter de Berlis, dated "in castris iuxta Accon," May 1191.
18. John, count of Ponthieu, stands surety for 200 *livres tournois* borrowed from Salvagius Testa, Peter Stroxoli and associates, citizens of Genoa, by Gui de Noellis, Hugh li Wer, Robert de Sancto Rikario and Radulphus de Vima, on behalf of all the Crusaders from the town of Abbeville, dated "in castris iuxta Accon," June 1191.
20. Philip, king of France, agrees to stand surety in place of Philip, count of Flanders, who has died during the siege of Acre while acting as guarantor for a total of 820 silver marks borrowed from Lodisius Brezano, citizen of Genoa, by the late count's knights Ingebrand de Mauritania, Sicher of Ghent, Nicholas de Ruminiaco, Matthew de Cysonio, Philip de Hamald, Hugh de Roureio, Roger de Bosco, Gui de Morlaio, Walter de Leskin, and Baldwin de Villeriis, dated "in castris iuxta accon," 1191, witnessed "in palacio nostro" by Gui the butler, Matthew the chamberlain, and Radulphus the constable. . . .
21. Richard, king of England, duke of Normandy and Aquitaine, and count of Anjou, safe conduct to travel back beyond the seas, without loss of the status of a Crusader, to Jacobo de Ihota to collect money due back to him having been loaned, on the king's surety, to Galfrid de Haia, William de Gorram, Philip Walensi and Marcaderus, "Teste me ipso Apud Accon," 3 August [1191].[227]

These documents provide interesting and valuable evidence for a number of important points, not the least of which is the fact that financial dealings were complicated and detailed documents were necessary. First, it is clear that financial dealings were required during the Crusade to make it possible for the participating soldiers to meet their financial obligations. Second, nineteen of these dealings took place in the Crusader camp outside Acre, five took place in Acre, and in one case, the document indicated it was executed in Jaffa. This suggests that life in the Crusader camp near Acre took on the character of a small town, with commerce, religious services including even marriages, and apparently even the minting of coins. Third, most of the loans reported in these documents were handled by Genoese or Pisans, with the Genoese being more prominent in numbers and in the amounts loaned. Fifteen Genoese merchants were mentioned by name, compared with only four Pisans, but one of the latter, Jacopo de Ihota, is mentioned five times. Indeed, a number of financiers and borrowers are mentioned in more than one document. Fourth, the Italianate character of these documents produce the interesting phenomenon of names being written in phoneticized Italian spellings. For example in no. 18, we read Robert de Sancto Rikario for Robert de Saint Riquier. Fifth, the multicultural nature of the people involved in these documents, both in terms of their place of origin and their station in life, is notable. We find the financiers to be all Genoese or Pisans. The borrowers include many French or Italians, a few Flemings, one or two English and Germans. Those standing surety are for the most part prominent figures such as the bishops of Beauvais or of Chartres; Richard, king of England, or Philip, king of France; and the counts of Ponthieu, Flanders, Blois, or certain knights. One figure, Radulphus of Coucy, is apparently a member of the family whose heraldic arms appear on a "wappenpokal" found at Resafa in 1982. Radulphus, or Raoul, stood surety in May 1191, at Acre, but then apparently died shortly thereafter, in November 1191 also

at Acre.[228] The "wappenpokal" that later turns up at Resafa in the thirteenth century may have been brought to the Latin Kingdom by Radulphus.[229]

In sum, these pieces of vellum with their financial records potentially provide a remarkable insight into the lives of a number of important and not so important Crusaders. Major sums of money are involved, so records such as these are necessary. Many of these persons, like Radulphus de Coucy, must have had personal possessions that included works of art, including not only metalwork, but also manuscripts and devotional images. These parchment records do not tell us about those works of art, but they do provide a glimpse of the rich cultural context in which the Crusaders lived and died, and out of which their artistic production emerged.

Crusader Coinage in the Latin Kingdom, 1187–1192

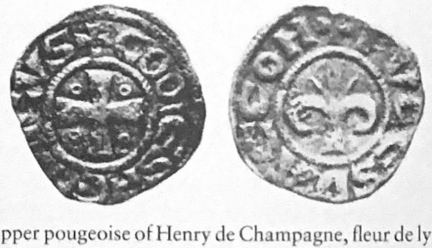
Besides the proposed emergency issue of coinage in Jerusalem struck in September 1187 to help pay for the defense of the Holy City by Balian d'Ibelin and Patriarch Heraclius discussed above, there are a number of other anonymous, special coin issues that have not been securely dated or located.[230] In comparison, there are relatively few examples of regular Crusader coinage in this period. The historical situation during Saladin's conquest and the subsequent period of the Third Crusade was obviously turbulent. Our understanding is hampered by the lack of coin hoards from this crucial period. Nonetheless questions arise about the regular royal Crusader coinage that exists, despite the rapid changes in rulers in 1191–2. We must consider the various anonymous coins, possible baronial issues, and the presence of western European coinage brought eastward by the Third Crusaders.

In considering royal issues by the Latin King of Jerusalem, there is the possibility that the old "Amalricus" denier (Fig. 10) was continued as an immobilized type after the death of Amaury, not only during the time of Baldwin IV, Amaury's brother, and Baldwin V, Amaury's son, but also possibly during the reign of Guy de Lusignan.[231] Guy was, after all, married to the daughter of Amaury. Considering this possibility, however, we have to admit that there is no particular numismatic evidence to attribute examples of this coin to the period 1187–92. All that we can say is that Guy de Lusignan issued his own distinctive coinage at some point between 1186 and 1194, as did Henry of Champagne, 1192–7. The hoard evidence that we have strongly suggests, however, that immobilized types were continued after the death of Amaury in 1174.[232] The question is when and by whom?

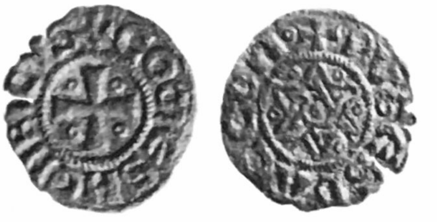
If we accept the idea that the three logical mints in the Latin Kingdom prior to Saladin's conquest in 1187 were Jerusalem, Acre, and Tyre,[233] the problem of what happened to the currency stocks between 1187 and 1191 can be hypothetically answered by at least suggesting that they may have been secured in Tyre until Acre was retaken in 1191. How soon the minting of the immobilized "Amalricus" type may have been resumed is unclear, but on the whole, it seems unlikely between 1187 and 1192. It seems unlikely because of the chaos and confusion in regard to who held the kingship and under what circumstances during the military action in this period, and the fact that Conrad of Montferrat, not yet elected king until 1192, held the city of Tyre from 1187 until he was assassinated there. Other factors to be considered are the possibility that Guy de Lusignan may have issued his own coins, and the fact that Henry of Champagne appears to have issued his own currency at this time. Additionally, there seems to have been some separate emergency coinage struck as well. One might entertain the notion that a regular, traditional coinage in the name of a former king could usefully have been resorted to when Guy was attempting to survive as king after Hattin in July 1187, both before and especially after the death of his wife Sibylla in the early fall of 1190. But the hoard evidence does not seem to reveal any evidence to lend credence to such an idea.

Among the royal issues by the current Latin King of Jerusalem, two distinctive coins are conveniently identified: 1. an interesting copper coin with a portrait of Guy de Lusignan, inscribed on the obverse, "+ REX GVIDO D," and on the reverse, "EIERUSALEM,"[234] (Fig. 11) and 2. a copper coin known as a *pougeoise* of Henry of Champagne inscribed on the obverse, "+ COMES HENRICUS," and on the reverse, "+ PUGES DACCON"[235] (Figs. 12 and 13). Conrad of Montferrat was not known to have issued any coinage in the Levant while he was in command of the city of Tyre or during his brief time as king-elect.

The copper portrait coin of Guy de Lusignan has been persuasively argued by Metcalf to have been minted most likely only on Cyprus.[236] Moreover, as Malloy, Preston, and Seltman illustrate, there are three distinct portrait types.[237] All three portraits are bearded, but one has a Byzantine-style crown with



12. Acre, copper pougeoise of Henry de Champagne, fleur de lys on reverse. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)



13. Acre, copper pougeoise of Henry de Champagne, hexagram on reverse. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)

pendulia, one has a Western-style crown with three jewelled crosses, and one seems to be a debased version of the Byzantine type in which the curls of the hair predominate. All three have the peculiar division of the "DE" of the inscription, with the "D" on the obverse and the "E" on the reverse. How can these different portrait types be explained?

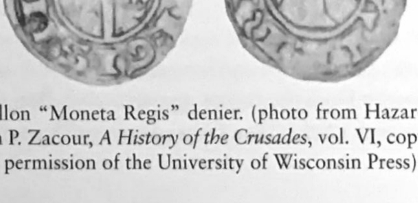
If Metcalf is correct that Guy issued all of his coinage during his two-year time on Cyprus, it means that he combined the "Rex Guido de Ierusalem" type with two issues that refer to Cyprus in their inscriptions. There was a scyphate electrum bezant with a full-length standing figure of the king on the obverse with the inscription, "+ REX GVIDO DE CIPRO," and on the reverse, a seated figure of Christ enthroned with the inscription, "IC" "XC." The image of the full-length figure of the king appears to be drawn from Guy's royal seal of 1190, where the king is depicted full length, but enthroned.[238] The image of the standing full-length ruler and the style of his royal robes seem to derive from Byzantine sources.[239] There was also a copper coin with an eight-pointed star on the obverse and the inscription, "+ REX GVIDO," and on the reverse, a cross with pellets, and the inscription, "+ DE CIPRO."[240] The fact is, of course, that Guy was crowned king of Jerusalem, but was never crowned king of Cyprus. Furthermore it is documented that Guy used his title, king of Jerusalem, on Cyprus. And, as Metcalf points out, almost all of the extant Guy de Lusignan coins have been found on Cyprus, almost none in the Holy Land.[241] Metcalf speculates that the "Rex Guido de Ierusalem" coins may have been minted in Limassol.

There are two observations to be made about this unexpected possibility. If Guy de Lusignan really did have all his coins minted on Cyprus, it symbolically indicates at the very outset of the Lusignan dynasty on the island the close link that would exist between Lusignan Cyprus and the Latin Kingdom, politically, economically, and otherwise, all through the thirteenth century. Furthermore, the copper coin with the inscription, "Rex Guido de Ierusalem" is unique among twelfth-century Crusader royal issues in using a portrait of the king in place of the "cross pattée" on the obverse, which is the normal motif on royal coinage. The likely model for the portrait obverse with an architectural motif reverse was the royal seal for the king of Jerusalem, which had a very strong tradition in the twelfth century.[242] For the idea of the bust-length portrait, it is not inconceiveable that Guy was inspired both by the Byzantine type mentioned earlier and the Bohemond III deniers from Antioch, the only Crusader coin type to employ this imagery consistently in the second half of the twelfth century.[243] We should note, however, that the Antioch helmet deniers employ the portrait on the obverse with the cross on the reverse. The problem here, it seems, was the cross on the traditional royal coin type obverse. I propose that whatever the source of the idea for the portrait, Guy placed his own royal image on this coin – following the program of his royal seal – as a carefully chosen substitute for the cross, in view of the fact that the True Cross was lost at Hattin when the Crusader army was under his command. The fact that he places an image of the Holy Sepulcher on the reverse of this coin, thereby maintaining the royal tradition of architectural motifs of the Holy City, means that he was sensitive to the traditions of royal numismatic and sigillographic design by his predecessors, the kings Baldwin and Amaury.[244] The intriguing representation of his royal portrait as both Frankish and byzantinizing in iconography seems, furthermore, to reflect the special conditions he faced on Cyprus, with the Greek population and the Frankish overlords, which he apparently was attempting to address.

In contrast to the coinage associated with Guy de Lusignan, the copper coins of Henry of Champagne are quite Western in appearance.[245] Henry did not rule as king of Jerusalem and he chose to style himself "+ COMES HENRICUS" on the obverse of his coins, never using the royal title on his coins in the Levant (Figs. 12 and 13). On the reverse we find a handsome fleur-de-lis, or, quite rare, a hexagram or six-pointed star, both motifs found in France, but oddly not in Champagne.[246] There is also the unusual feature for Crusader coins of the designation of the currency, "PUGES DACCON." The denomination of these coins is somewhat in doubt. They are not deniers; they are *pougeois* or oboles, a coin worth a quarter of a denier. What is interesting about this is that a *pougeois* only makes its appearance in France slightly later, in the early thirteenth century.[247]

Henry of Champagne's coinage constitutes, as Porteous describes it, "the first coins that can be given a definite place in the renascent kingdom."[248] They demonstrate a certain connection with western Europe that reflects the strong influx of Western Crusaders and, no doubt, Western coins with the Third Crusade. They also show that ideas for types, as well as design and designation can still come from the Crusader East even during this period of upheaval and reorganization, and they provide us with a link to the future in terms of the Latin Kingdom of Jerusalem, because as coinage they are issued from 1192 to 1197.

Among the most intriguing coinage in this period there are a certain number of anonymous issues, one of which features a cross design of great interest (Fig. 14). There is a billon denier with the image of the True Cross, that is, a double-armed cross, which includes a pendant alpha and omega from the lower crossarm. It appears on the obverse with the inscription "MONETA REGIS," and on the reverse a typical equal armed cross pattée with the inscription "+ REX IERL'M."[249] This coin



14. Acre, billon "Moneta Regis" denier. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)

is related to an anonymous billon denier, a royal issue probably from the time of King Fulk that also carries an image of the True Cross, as well as the seals of the grand masters of the knights Hospitaller.[250]

Without doubt it is the imagery of the True Cross that is distinctive about this coin. The True Cross served as one of the fundamental symbols of the Crusader presence in the Holy Land during the twelfth century.[251] When the relic of the True Cross was lost at the battle of Hattin, however, the Crusaders ceaselessly attempted to recover it through their negotiations, as recorded by the chroniclers of the Third Crusade and Saladin's historians and biographers. There can be little doubt that for the period 1187–92, the True Cross was very much on the minds of the Crusaders.[252]

What distinguishes the image of the True Cross on this coin is the presence of the pendant alpha and omega. Since early Christian times, the alpha and omega when associated with the cross symbolized the infinite nature of Christ, and the universality of the message of the cross for all time.[253] No reliquary of the True Cross, Crusader or otherwise, survives in this period, 1098–1291, however, with pendants of the alpha and the omega.[254] The sole examples of this iconography in the twelfth century otherwise appears to be on the seals of the grand masters of the Hospitallers and on one early seal of the bishop of Acre.[255] Given the way the representation is composed on the Hospitaller seals, one is meant to understand that the grand master is depicted kneeling before an image of the True Cross, or a reliquary of the True Cross. The most notable reliquary of the True Cross in Jerusalem was, of course, the royal Crusader reliquary in the Church of the Holy Sepulcher, which was located very near to the Hospital of the Knights of St. John.[256] We have no information that this royal reliquary had pendants of the alpha and the omega, nor do we hear of a representation in the True Cross chapel with this iconography.

What does this specific iconography mean on the coin? It appears that the iconography of the double-armed True Cross with the alpha and omega as pendants is particularly associated with the Hospitallers in Jerusalem in the twelfth century, before 1187. In 1187, with the loss of Jerusalem to the Muslims, however, this association was interrupted. In 1191, with the reconquest of Acre by the Crusaders, the cult of the True Cross was reestablished in Acre. Not only was the patriarchal church in Acre dedicated as the cathedral of the Holy Cross, but also the headquarters of the knights Hospitaller was relocated there. We may also note that, although the Hospital in Acre was originally located in close proximity to the Cathedral of the Holy Cross where the relic of the True Cross was kept, by 1149, however, the Hospitallers had moved farther to the west, and also we now know the cathedral was located farther to the east than originally thought.[257] The fact that the "MONETA REGIS" coin is anonymous, that it uses the special iconography of the True Cross with the alpha and omega as pendants, and that it retains the reference to Jerusalem on the reverse, seems to indicate several significant things. First, this is a coin that is associated with the newly relocated cult of the True Cross in Acre after its reconquest in 1191. Second, the special iconography of the True Cross with the pendants found here is important. It both differentiates this coin from the earlier anonymous billon denier coin with the imagery of the True Cross issued in Jerusalem at the time of Fulk,[258] and it maintains the association with the Hospitallers, whose grand master continued to use this iconography on his seal throughout the thirteenth century. It is this strong connection with the Hospitallers that has been noted with regard to the city becoming known as St. Jean d'Acre, either at the end of the thirteenth century or possibly later, exactly when is not certain. Third, I believe that Metcalf may be correct in suggesting that "the issue could have been produced in haste immediately after the recovery of Acre, when King Richard and King Philip were still adjudicating the rival claims of King Guy and would-be king Conrad."[259] This means that just at that crucial time when the kingship of Jerusalem was unresolved, in July of 1191, a coin was struck that nonetheless proclaimed the association between the king of Jerusalem and the True Cross, and it was struck in Acre where the cult of the True Cross was newly reestablished. At the time of its reconquest, Acre became the provisional capital of the Latin Kingdom and, although the Crusaders could not have known it in July 1191, it would remain the de facto capital for one hundred years. Finally, the "MONETA REGIS" coin featured iconography strongly associated with the Hospitallers, who were heavily involved in the affairs of the kingdom and, along with the Templars, had assumed a new importance in these affairs during the Third Crusade.[260]

The strong association of Acre with the cult of the True Cross at this time can be reinforced indirectly by a curious story about Conrad de Montferrat. The continuation to the Genoese chronicler, Caffaro, reports that sometime after the Crusaders retook Acre in July 1191, Conrad of Montferrat and the king of France, Philippe Augustus, found a reliquary of the True Cross in the commandery of the Hospital of St. John in Acre. The relic contained inside was apparently labeled as follows: "crux sancta hospitalis beati Laçari de Betania." This suggests that a relic of the True Cross, formerly preserved in Bethany, had been brought to Acre for safekeeping, perhaps at the time of Saladin's invasion. Conrad of Montferrat sent this relic to the Cathedral of St. Lawrence in Genoa where it was exposed behind the altar dedicated to St. John.[261] The story raises many questions, not the least of which is why and under what circumstances Conrad would remove a reliquary from the hospital in Acre. Whatever the explanation for that may be, it is evident that it would not have been possible for anyone, and especially Conrad, to export a relic of the True Cross from Acre at this critical time, unless the Crusaders had their own relic ensconced in the place of honor in the Cathedral of the Holy Cross.[262] Richard I had been given two relics of the True Cross while the Crusader army was camped in Beit Nuba in June of 1192. Presumably one or both of these relics were deposited in the Cathedral of the Holy Cross before Richard left Acre. The Syrians in Acre were also said to have a relic of the True Cross as they also had in Jerusalem at the Church of the Holy Sepulcher.

In sum, the "MONETA REGIS" coin appears to be a special regal issue of limited numbers produced in Acre, one which is accordingly very scarce in the finds and only found in the region around Acre. Clearly it celebrates the association of the king of Jerusalem with the True Cross. Quite possibly it may have been struck to commemorate a special event, such as the restablishment of the cult of the True Cross in Acre at a time

15. Acre, gold bezant, 80% fineness. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)

when the kingship was unresolved, or even the peace treaty of 2 September 1192.

The other type of royal coinage to be noted is the gold issue, the bezant. In the years 1187–92, the bezant produced in the Latin Kingdom underwent a major change in metal content although the type of Muslim coin it imitated continued to be the al-Amir type, a type found in Egypt all through the twelfth century.[263] The gold standard of 80 percent fineness (Fig. 15) was reduced at some point to 68 percent fineness (Fig. 16). Numismatists refer to the turbulent events of 1187–8 as the likely time that the change occurred, noting that "new bezants" are referred to in certain documents of 1190, 1192, and 1194.[264] These coins appear to have been minted mainly in Acre (1191–2) and Tyre (1187–92) in the period we are discussing here.

As for baronial coinage in this period, there was little, because the main centers (e.g., Sidon and Beirut) were not under Crusader control between 1187 and 1192.[265] Only Tyre was, but Conrad of Montferrat issued no coins during his stay, and its baronial coins are much later, from the mid-thirteenth century, and mostly from the second half. In sum, baronial coinage, thought at one time to be proliferating during the time the royal rights of the kings of Jerusalem were being weakened, especially in the period of 1187 and the years immediately following, is not yet a factor to be considered by 1192.

Farther north, in Tripoli and in Antioch, coinage was however continuing to be issued all through this period. The major coin type of Tripoli between 1187 and 1192 consists of a star billon denier, either bearing the name of Count Raymond III, "+ RAMUNDUS COMS" on the obverse or, after his death in 1187, "+ BAMUNDUS COMS" (Fig. 17) when Bohemond of Antioch assumes power.[266] The denier gets its popular name from a handsome eight-pointed star on the reverse, which is surrounded by the inscription: "+ CIVITAS TRIPOLIS." Copper coins from Tripoli at this time are anonymous by contrast and only carry the inscription "Civitas Tripolis." They can have the interesting star and crescent design, or a fortified gate or castle design (Figs. 18 and 19). Tripoli was also the source of a gold bezant (Fig. 20) modeled on the eleventh-century type of al-Mustansir in contrast to what is found in the Latin Kingdom of Jerusalem. Like the Latin Kingdom bezants, the standard of gold used for those produced in Tripoli was changed in 1187 or a year or two later.[267]

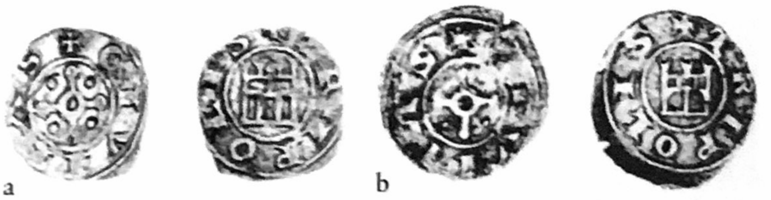
16. Acre, gold bezant, 68% fineness. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)

Antioch also used al-Mustansir type bezants, but their supply was apparently minted in Tripoli.[268] In Antioch, the helmet denier is the major coin type (Fig. 21), one of the longest-lived types of any Crusader coin, dating from the time of Bohemond III about 1187 to the time of Bohemond VI, who died in 1274.[269] These brief comments on the coinage of Tripoli and Antioch indicate that their mints continued basic immobilized types with little alteration between 1187 and 1192, although the levels of production may have been reduced. We can expect that the upheaval created by Saladin's invasion of the Crusader States would, however, eventually cause some important changes in the North as well.

This leaves the important question of the role and importance of western European coins in the Crusader States to be considered. Michael Metcalf has observed that

> if European deniers were imported into the Crusader principalities in the decades before the fall of the First Kingdom [1187], it would seem that in principle they were required to be melted down and reminted into the official issues of the Latin kings or the counts of Tripoli or the princes of Antioch, for the hoards . . . contain few strays of European types, other than the preferred currencies. From the time of the Third Crusade a totally different situation obtained in the Latin Kingdom (but not, apparently, at Antioch). A profuse variety of French, Italian, and other western European coins are found in five important hoards from Tripoli, Kessab, Châtelleraullt, the Lebanon ("Stewart"), and Syria ("Phillips"), all from the early thirteenth century.[270]

What the hoard evidence seems to indicate therefore is that with the arrival of the Third Crusade, once again we find, just as we found at the time of the First Crusade, there were significant numbers of western European coins in circulation in the Crusader States. This presence will apparently continue to build into the first quarter of the thirteenth century as the result of subsequent expeditions, including the German Crusade of 1197, the Fourth Crusade, and the Fifth Crusade.[271] The question that we must investigate insofar as it is possible is, to what extent did the presence of this coinage shape the Crusader issues in the Holy Land between 1191 and the 1220s? The remarkable fact is that, except for the coins of Henry of Champagne, Western coinage had little impact between 1191 and 1192, and, if anything, Henry devised a denomination in



18. Tripoli, anonymous copper coin with fortified gate. (photo: after Slocum catalogue)

the Latin Kingdom, the *pougeois*, that then emerged later on in France.

The introduction and presence of so many Western coins in the Latin East starting at this time, in the early 1190s, certainly underscores one aspect of developments there that we have already seen in other ways, namely, the multicultural character of trade, commerce, and currency in the Crusader States. Just as the language of shipping and maritime commerce, the lingua franca was developing in the eastern Mediterranean at this time,[272] the variety of coins provided, mutatis mutandis, a monetary equivalent to the linguistic phenomenon. The coins provide one means – limited but important – of assessing artistic developments at this time. But it is an extremely valuable means because it demonstrates, as the figural art before 1187 also demonstrated, the strongly independent, Eastern character of the Crusader outlook in regard to those visual productions that would enjoy a multicultural audience. This is in distinct contrast to certain other Crusader features, such as, for example, their military armor and weapons, which tended to be strongly Western in character, despite some appropriation of Eastern types.[273] What can we say of artistic developments in regard to the other figural arts and in regard to developments in western Europe at this time?

The Art of the Crusaders at the Time of the Third Crusade

We have seen on the basis of evidence pertaining to the First and Second Crusades that varied Crusader-sponsored artistic activity was possible in the Holy Land during the time a Crusade was in progress, but that the Crusade itself did not necessarily stimulate very much such work.[274] In the case of the Third Crusade, however, the Crusade not only directly stimulated and effected certain kinds of artistic or architectural activity, but also it was apparently responsible for the curtailment of other work. Let us consider the identifiable examples.

It must be said that the situation at the time of the Third Crusade was different from earlier times, first because of the damage and destruction to works of specifically Crusader art and architecture in the wake of the disaster at Hattin, Saladin's conquest of most of the Latin Kingdom, and his capture of Jerusalem in 1187–8. What would the Crusaders choose to rebuild and replace; what could they rebuild and replace?

We should recall that the Crusaders in the Holy Land had commissioned a great deal of art between the 1130s and 1187. There was a certain tradition of production in various media, venues for artists to work, established centers. Saladin's invasion and especially his conquest of Jerusalem seriously interrupted these developments. But just as the Latin Kingdom was not eliminated and the Third Crusade revived it politically, the art of the Crusaders would not have been eliminated, but relocated and revived. Where can it be found and under what circumstances, between 1187 and 1192?

It is also true that the Third Crusade generated developments in art not known from the earlier expeditions. For example, at the time of the preaching of the Third Crusade, visual art apparently played a role in the recruitment process. "The use of images naturally took its place alongside sermons, songs and liturgy in the dissemination of crusading ideology."[275]

What is interesting at the time of the preaching of the Third Crusade is that we find a new connection to the Holy Land in regard to the dissemination of the crusading ideology. Images are produced that would accompany the preachers and that would be shown to the crowds to spur them to take the cross. Ibn al-Athir reports that at Tyre,

> monks and priests and a crowd of Frankish knights and nobles dressed themselves in black and expressed great grief at the loss of Jerusalem. The Patriarch of Jerusalem [Heraclius] took them with him on a journey through the Frankish domains calling on the people to help, invoking their aid and inciting them to avenge the loss of Jerusalem. Among other things, they made a picture showing the Messiah, and an Arab striking Him, showing blood on the face of Christ – blessings on Him! – and they said to the crowds: "This is the Messiah, struck by Mahomet the prophet of the Muslims,[276] who has wounded and killed Him."[277]

Baha ad-Din also reports on the role of Conrad of Montferrat in the recruiting for the Third Crusade,

> the Marquis, the ruler of Tyre, was one of the most cunning and experienced of the Franks, and his was the chief responsibility for luring the crowds of Crusaders from overseas. He had a picture of Jerusalem painted showing the Church of the Resurrection, the object of pilgrimage and deepest veneration to them; according to them the Messiah's tomb is there,

21. Antioch, helmet denier of Bohemond IV or Bohemond V. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)

> in which he was buried after his crucifixion. This sepulchre was the object of their pilgrimage, and they believed that every year fire came down upon it from heaven... [the Holy Fire on Holy Saturday]. Above the tomb the Marquis had a horse painted, and mounted on it a Muslim knight who was trampling the tomb, over which his horse was urinating. This picture was sent abroad to the markets and meeting-places; priests carried it about, clothed in their habits, their heads covered, groaning: "O the shame!"[278]

It is remarkable that Muslim historians are commenting on this phenomenon. Apparently the reason they are aware of it is that these images originated with the Crusaders in the Latin Kingdom. Baha ad-Din clearly states that this kind of image was commissioned by Conrad, and the text suggests that it was produced in Tyre, before being sent overseas. Ibn al-Athir does not indicate precisely where the image of the Arab striking Christ was done, but Tyre is the most likely place based on what he says in his text. Also, we do not know exactly where Heraclius went after he left Jerusalem with many church treasures,[279] but clearly he may also have gone to Tyre as well as Antioch, as mentioned earlier. In any case, these texts suggest that one source of propaganda images for use in recruiting for the Third Crusade was imagery from the Holy Land, specifically from Tyre which Conrad commanded through the dark days of 1187, 1188, and beyond.

Unfortunately, nothing can be identified as yet that might give us a notion of what these propaganda images specifically might have looked like, but we can imagine a scene of the Arrest of Christ in Gethsemane, or the Mocking of Christ, being adapted for the scene described by Ibn al-Athir. We can also conjure up in our mind's eye what the components of the Holy Sepulcher and a mounted Muslim knight might have looked like if painted by a Crusader artist, based on comparison to existing paintings, especially from manuscripts of the second half of the thirteenth century.[280] Finally, perhaps we can see in Italian art the change of the image of the Arab generated by Crusader images, of which the placards would have been one type. Consider the development from the formulaic imagery based on Byzantine models found in the mosaics of San Marco in the twelfth century, to the more portraitlike handling, ethnically and otherwise, in the painting of St. Francis before the Sultan in the upper church at Assisi and Giotto's fresco in the Bardi Chapel in Santa Croce in Florence, of the thirteenth and fourteenth centuries.[281]

The significance of these stories beyond the immediate association with propaganda images is the suggestion they give to the role of Tyre as a possible center of Crusader image making. Tyre was an artistic center we know about in the twelfth century in terms of architecture and coinage but from which we have nothing much extant in terms of painting or sculpture. Nonetheless we have good reason to think of Tyre as playing some kind of a role as a center for Crusader art because of its importance politically and militarily, because Saladin did not take it during his invasion of the Latin Kingdom, because it was therefore a place of refuge for many during that invasion, and because it was an important Crusader port. Are there any other indications from the story of the Third Crusade that would enlarge our picture of Tyre as some kind of an artistic center?

One of the notable features of the Third Crusade is the phenomenon of diplomatic missions, which are sent back and forth for various purposes. Diplomacy had formed a part of political life in the Latin Kingdom from early on.[282] From this point on, however, active diplomacy to arrange treaties, truces, and terms of agreements became an increasingly important aspect of Crusader political life in terms of foreign policy.

Between 1187 and 1192, negotiations were carried out for the surrender of Jerusalem in October 1187 and the ransom of the Frankish Christians in the city.[283] Arrangements were made for the terms of the surrender after the Christians retake Acre in July 1191.[284] When these terms were not met, new negotiations were opened that carried on until ultimately the Treaty of Jaffa is agreed on in September 1192.[285] The diplomatic interchange was effected between the Crusaders and Saladin, but the embassies actually involved a number of important persons, including Saladin and his brother, al Adil, and the Muslims were actively in contact with Conrad of Montferrat in Tyre as well as the main Crusader army, while Richard I was trying to involve him in the military activities farther south during the campaign of 1191–2.

Because such diplomatic exchanges usually involved the presentation of gifts as part of Near Eastern custom, and sometimes gifts of great value such as works in precious metals were involved, the Crusaders would have had to rely on certain places with treasuries and artist's ateliers as sources of these gifts. It is clear from the chronicles that diplomatic gifts often included objects captured in some military action.[286] Again Tyre, and later Acre, would be a source for certain objects to be stored and acquired, or even a place where they may have been produced. We know that Christians carrying their personal possessions, some quite valuable possessions, streamed into Tyre, and probably Tripoli and Antioch, during the dark days of 1187 and 1188. Some of these treasures no doubt remained in Tyre; some were probably later transferred to Acre. But these possessions and the treasuries in which they were preserved – royal, ecclesiastical, Hospitaller, Templar, aristocratic, commercial, knightly – as well as the artistic venues for making such objects in all of these cities, will need to be considered throughout the period from 1191 to 1291. We shall also wish to scrutinize all diplomatic exchanges involving the Crusaders for evidence of artistic activity in this period.[287]

Among the most valuable objects in Crusader possession, two that rank at the very top are the reliquary of the True Cross and the regalia of the king of Jerusalem. Despite the loss of the state relic at the battle of Hattin, it is clear that the Crusaders remained devoted to and identified with the True Cross in the succeeding years. Having suffered the loss of the official relic into the hands of Saladin, the defenders of the city of Jerusalem in 1187 turned to the Syrian relic of the True Cross in their prayer and procession for the protection of the city.[288] The Crusaders continually strived to effect the return of the state relic all through the diplomatic negotiations of 1191 and 1192.[289] Remarkably Conrad is reported to have sent a relic of the True Cross from Bethany found in Acre in 1191 to Genoa. King Richard I received two relics of the True Cross while encamped at Beit Nuba in 1192, and quite possibly one or both were given to the cathedral in Acre.[290] We note how devoutly the soldiers who went on pilgrimage to Jerusalem in September 1192 venerated the relic of the True Cross shown to them in the Church of the Holy Sepulcher.[291] We may also expect that the patriarch once again placed a relic of the True Cross in the chapel of honor in the Cathedral of the Holy Cross in Acre as soon as possible.[292] The Templars had a relic of the True Cross in Acre. It is evident, too, that the grand masters of the Hospitaller order retain the True Cross on their seal, and we can even note a subtle change in the depiction of that cross in the thirteenth century.

What can be the reason the True Cross on the Hospitaller seals is given a stand on its base in the seals of Garin de Montaigu (1207–28) and Nicholas le Lorgne (1277–85), in contrast to the unspecified bases on the seals of Caste de Murols and others before 1187?[293] Could it be that a new reliquary of the True Cross was manufactured when the Hospitallers were reestablished in Acre and that the seals reflect this new configuration? Furthermore, was the flourishing production of reliquaries for True Cross relics, found among Frankish and Syrian goldsmiths in Jerusalem before 1187, transferred to Acre, so far away from the holy site of Golgotha and the Chapel of the Cross in the Church of the Holy Sepulcher?[294]

The regalia of the king and queen of Jerusalem was obviously more controlled, but what happened to the regalia when Jerusalem fell? The last time the regalia had been seen was in Jerusalem when these objects had been taken out of a special treasury box or trunk for use by Guy de Lusignan and Sibylla in 1186.[295] Was this trunk then taken to Tyre for safekeeping, and eventually to Acre when preparations were being made for the coronation of Conrad that never took place? Both Tyre and Acre are important for the kings of Jerusalem in the period 1191–1291. We shall have to examine the evidence of both places to discover the artistic role they play for the king and queen, and for the kingship of the Latin Kingdom of Jerusalem, in terms of the regalia.

There are two final issues to consider here in regard to Crusader artistic activity in the Holy Land during the time of the conquest of Jerusalem and the Third Crusade, 1187–92. We have discussed instances where Frankish Crusader art was known to be hidden and preserved (e.g., the Nazareth Capitals). We have seen it destroyed or rebuilt (e.g., a number of city walls, fortifications and buildings, and especially the case of Ascalon). We have seen projects interrupted (e.g., the fresco program at Margat castle). And there have been works produced de novo (e.g., especially the coinage or placards for recruiting during the Third Crusade). What about the art of other Christians in the Latin Kingdom, in Jerusalem, in Acre, in Tyre, and elsewhere? Who were the Eastern Christians in Jerusalem and the Crusader cities on the coast?

In Jerusalem we know from various sources, some of which we have already discussed, that after the Frankish Christians had left in 1187, the Eastern Christians that remained were mainly local Arabic- or Syriac-speaking Christians, along with Armenians, Copts, Ethiopians, and Georgians.[296] Indeed many of these Eastern Christians were on good terms with the Muslims, some even with Saladin personally. Cahen tells the story of a physician, Abu al Khayr, son of a Christian physician whose father became a monk at the time of the Crusader King Amaury. Abu al Khayr had access to the Crusader royal court – he taught the leper king, Baldwin IV, to ride horseback – but he also was in contact with Saladin. In fact he sent Saladin a letter predicting that he would conquer Jerusalem on the basis of astrological information from his father. When Saladin did in fact conquer Jerusalem, Abu al Khayr was rewarded as a member of a family of Christian physicians.[297]

Certainly the art of these Eastern Christians who stayed on in Jerusalem was not destroyed. Certainly the art that these Eastern Christians commissioned continued to be produced. Certainly the Crusaders continued to have access to these Eastern Christians and could commission "Crusader" art as well, if not so readily in Jerusalem, then in Tyre, and eventually in Acre after it was retaken. It remains to be seen if we can identify "Crusader" art made for them by Eastern Christians, in the period from 1191 to 1291,[298] the way we have identified some examples in the period 1098 to 1187.[299] We shall search for examples in Crusader territory, such as Acre, Tyre, Tripoli, or Antioch, or in territory mostly in Muslim hands in this period, in particular the main Christian holy sites of Jerusalem, Bethlehem, and Nazareth.

The second issue deals with the interface between the Crusader States and the surrounding territories – near and far – including western Europe, Byzantium, and the Muslim states. We have seen that the presence of imported European coins is an important aspect of the Third Crusade in the Holy Land. In light of important artistic developments in Europe at this time, some of it characterized by strong Byzantine influcence,[300] what is the role of the Frankish East in these developments? Were works of Crusader art taken to Europe in 1187 with fleeing Frankish residents of the Latin Kingdom including some of the twelfth-century Crusader manuscripts now in Western libraries? Is there any evidence that European art was sent to the Levant to fill a need that the Crusaders could temporarily not fill because of the upheaval and destruction wreaked by Saladin in 1187 and 1188? How did the European developments embodying the transition from the Romanesque to the new Gothic style relate to new artistic activities in the Holy Land by the Crusaders? To what extent was the new wave of Byzantine influence in Italy at the end of the twelfth century and the strong byzantinizing presence there all through the thirteenth century related to Crusader developments?

One intriguing development in Rome highlights the importance of this question. Philippe II Augustus left the Third Crusade immediately following the capture of Acre, as we have seen, but his return trip home was infinitely more successful than that of Richard I. Richard, as we remember, was captured by Leopold of Austria, accused of murder, imprisoned, and turned over to the emperor, Henry VI.[301] He was only released many months later by the payment of a huge ransom. Philippe II Augustus, although maligned in some English sources as cowardly, was apparently in bad health, and he needed to attend to affairs at home, hence his decision to leave for France. On his way from Brindisi, he stopped at Rome, where the pope, Clement III, gave him an image of the Veil of Veronica, that is, "Veronicam i.e. pannum quemdam linteum quem J. C. vultui suo impressit."[302] The "Vericon" or "vernicle," which became the central image relic of Christ in Rome in the Middle Ages and later, and whose origin there is shrouded in mystery, is first mentioned specifically in Rome in this incident. Although ironically, Philippe Augustus does not bring the image to Rome, but rather receives it there, it is he, the Crusader homeward bound, who is connected with one of its first documented appearances there.[303]

Byzantium in the late twelfth and early thirteenth centuries was severely weakened after the defeat at Myriocephalon in 1176 by power struggles in the imperial court and, of course, by the Crusader sack of the city of Constantinople in 1204. Crusader involvement with Byzantium increased during this period through interaction with Frankish settlers in Byzantine lands. The Crusader experience and their artistic developments in the Holy Land in the 1190s and 1200s has been largely overshadowed, screeened off, veiled from Western view by the events of the Fourth Crusade and the new Frankish presence in Cyprus, Constantinople, and Frankish Greece. It is hoped that by looking at the Crusaders' experience in the Holy Land, and their relationship with the Byzantines and Franks in Byzantine territory, from an Eastern vantage point, we can try to observe and recover more of what happened there artistically.

Finally, the importance of diplomatic interaction with the Muslims was greatly expanded during the Third Crusade. Even though Saladin would die at age fifty-four in 1193, the Crusaders had opened a new door to artistic awareness and influence in relation to the Ayyubid sultanate in Cairo. This diplomatic focus was paralleled by a new military strategy that apparently had been first aired in the Crusader council called by Richard I in camp at Beit Nuba in the summer of 1192. Resident Crusaders at that council had advocated the idea of attacking the Muslims in Egypt, thus diverting the military burden of battle and destruction to the south and away from the Crusader States. This strategy, first enunciated at the time of Richard I's Crusade, later materialized in the Crusades led by the legate Pelagius and then by King Louis IX and the legate, Eudes de Châteauroux. We shall have to examine whether this new orientation by the Crusade movement was paralleled by a new intercultural awareness artistically by the Crusaders in the Holy Land as well.

Conclusions

Compared with the First Crusade, the Third Crusade was a failure: Jerusalem and the other holy sites were not recaptured. Even measured on that standard, however, it was also a partial success, and compared with the Second Crusade it produced major accomplishments: Acre and the coast of Syria-Palestine were back in Crusader hands, and the Latin Kingdom of Jerusalem was reestablished on a firm footing. Nonetheless, Saladin's conquest of the Latin Kingdom and the ensuing Third Crusade had resulted in a much-reduced territory under Crusader control, compared with the Crusader States at the time of King Amaury I. From this point on, during the hundred years from 1191 to 1291, Acre was the de facto capital of the Latin Kingdom and Frankish holdings in Syria-Palestine, apart from the few major castles they held inland, existed as wealthy maritime communities, with some industry and limited special agriculture in the environs, perched precariously along the coast. By virtue of the change in focus from the holy sites to these commercial ports, the Crusaders enjoyed a certain prosperity economically, but always in the context of a dangerous and volatile political, diplomatic, and military situation. The Crusaders relied on diplomacy and détente with Byzantium and their adversaries, to some extent depending on the disarray of their enemies to protect them. With the advent of the Mongols from the East and the Mamluks in Egypt in the 1250s, however, both economic and political activities came under direct attack and were eventually snuffed out. In the face of this peril, the Crusaders relied ever more heavily on their maritime lifelines, with Cyprus nearby, and with Italy especially, but also with France in the West.

The status of the Latin Church in the Crusader Kingdom had been much changed by the treaty of Jaffa in 1192 in which Saladin and Richard I had agreed on territorial rights.[304] A narrow strip of coastland was guaranteed to the Franks, which extended from Tyre in the North to Jaffa in the south, and the Muslims and the Crusaders exercised a condominium over the towns of Lydda and Ramla. The devastating fact was, however, that of the original thirteen episcopal sees under the patriarch of Jerusalem, only three cathedral cities remained in Frankish hands: Acre, where the new patriarch would reside; Tyre; and Caesarea. In the latter two cases, their archbishops had survived the invasion and the Third Crusade. In the case of Acre, a new bishop, Theobald, formerly the prior of Nazareth Cathedral, was named shortly after the city was retaken by the Crusaders, in August 1191. The Crusaders hoped to reoccupy other sees in the coming years.

Nonetheless, the Crusaders did reconquer the country in 1192, whether it was relatively a larger or a smaller area they held. In doing this they embodied the "pioneer" ideals of the Frankish period, as the successors to the heroic First Crusaders;[305] Certain individuals came to be idealized, even mythologized, in these terms, in particular, there was Godefroy de Bouillon from the time of the First Crusade; from the time of the Third Crusade there was Richard the Lionheart, and later there would be Louis IX. There was also Eudes de Nevers whose tomb became a cult center. Their goals, vows, and efforts were dedicated to the name of God; they were leaders devoted to the Crusader cause, to their faith, for which they were ready to fight and die if necessary. In the eyes of their contemporaries this was the source of their strength. It is interesting that, as the Crusades developed, these important heroes, men like Richard I and Louis IX, were also major builders.

In terms of artistic activity, the prosperity of the Crusader commercial port cities supported the work that needed to be done, such as rebuilding fortifications. There is also some major new construction in Acre especially, but it is better known in the written sources than as extant architecture because of later destruction and rebuilding. Demand for figural works of art is apparently vigorous at times, but the locations and periods of flourishing production are difficult to identify with precision, except in certain special cases. Furthermore, the identity of patrons and the conditions of patronage, as well as the origins and training of the artists in the multicultural contexts of these fortified port cities, along with a few important castles, are major issues. Other difficult questions arise in regard to the process of workshop activity and the functions of the works. All of these factors require intensive scrutiny to clarify when, how, and why this art was done.

In the period from 1191 to 1204 and the following early years of the thirteenth century, certain work can be identified. Fortifications destroyed by Saladin were being rebuilt, some new castles were constructed, some new coinage was being issued. But there is little evidence for the production of manuscript illumination, metalwork, or other works of figural art so popular before 1187, work that must have been done after 1187 as well. Part of the reason for this may be the impact of the results of the Third Crusade, especially the conquest of Cyprus in 1191. As we have said, the trend to drain Frankish resources away from the Holy Land may be a factor: with the advent of the Lusignan dynasty on Cyprus in 1192, with the Fourth Crusade and the founding of the Latin Empire in Constantinople in 1204, with the advent of the Albigensian Crusade called by Pope Innocent III in 1208 in southern France, and with the Fifth Crusade, which applied the new strategy of attacking the center of Muslim power in Egypt first, to get to Jerusalem, in 1217. However we account for it, the fact is that the period from 1187 to 1229 was a period of contrasts. At a time when Crusading was at its height in terms of papal calls and organization, financial support and repeated waves of expeditions, activity in the figural arts by the Crusaders in the Holy Land was apparently seriously reduced, even while architectural construction of fortifications was at one of its peak levels. How will the art of the Crusaders reappear after 1192?

In 1187, after the conquest of Jerusalem by Saladin, the Armenian patriarch of Hromkla, Grigor IV, wrote an "Elegy on the Fall of Jerusalem."[306] In this long poem, which laments the fall of the Holy City, we find the following lines, spoken by the personified City of Jerusalem:

> I was left alone like a widow
> suffered alone in silence
> And nobody came to help me,
> Not the king of the Greeks
> And not my troops with the French
> Not the great mighty leader of the Germans
> And not the Latins of Dalmatia
> Nor those who are called lords of Hungary
> And not who is lord of Sicily
> Not Charlemagne, the people of the Franks
> And not the English, who is my son
> Not the king of the people of the Serbs
> And not the Pisans, who were proud
> Not Patzinac and Poitevin
> And not the Russian with the Bulgar
> Not the Longobard and Lombardy
> Not the Provençal and Venetian
> Not the Amalfitan and Genoese
> Nor the Tuscan and the Limousin
> Nor the Breton, the people of Tanais
> Not the Brabançons and Flemish
> Not the Gascon and Spaniard
> Not the Bourgond and Normandy
> Not Westfalen and T'iaysi[307]
> Not the Swede and the Pole
> Not East with West
> Nor North with South,
> Who one after another came to me
> And having entered me, were merry.[308]

These Christian peoples had not come to the aid of Jerusalem in her hour of need in 1187. Some had answered the call to the Third Crusade. This is nonetheless a fascinating roll call of Crusaders and, one way or other, they would all play a role in her fate after 1192; most would be involved in the reappearance of Crusader art from that time on into the thirteenth century.

3

THE ESTABLISHMENT OF ACRE AS THE CAPITAL OF THE LATIN KINGDOM OF JERUSALEM FOLLOWING THE THIRD CRUSADE

> Listen to my words.... Christ speaks to you today in his own words through my mouth and complains to you about the injuries that have been done to him. Christ has been driven out of his holy place, his seat of power; he has been thrown out of that city which he consecrated to himself with his own blood. Oh what an affliction!
>
> Abbot Martin of Pairis (1201) Sermon Preaching the Fourth Crusade

> You receive a soft and gentle cross; he bore one that was sharp and hard. You wear it superficially on your clothing; he endured it really in his flesh. You sew on yours with linen and silk threads; he was nailed to his with iron and hard nails.
>
> Innocent III (1208) Letter to Leopold of Austria

THE REESTABLISHMENT OF THE LATIN KINGDOM OF JERUSALEM FOLLOWING THE RECONQUEST OF ACRE: 1191–1197

The terrible events of the year 1187 resonated throughout the Holy Land and all over western Europe for a long time thereafter. With the Treaty of Jaffa in September 1192, the Third Crusade had succeeded in reestablishing the Latin Kingdom, but the Crusaders were confined to a narrow strip of territory along the coast from Tyre to Acre and Jaffa. Farther north they also held reduced versions of the County of Tripoli and the Principality of Antioch. Under the terms of the treaty, a truce was maintained for three years and eight months during which Christian pilgrims would be allowed open access to the Holy Sepulcher, Latin liturgical ceremonies were allowed to be performed at the major holy sites, and open commerce was protected.[1]

These arrangements were not ungenerous from a Muslim point of view, but they had been accepted by Richard I under duress, and in the larger Crusader perspective they were unpalatable and unsatisfactory except on an interim basis for the following reasons. Jerusalem, Bethlehem, and Nazareth were controlled by the Muslims. Ascalon, Gaza, and Darum had had to be returned to the Muslims and the walls of Ascalon, so arduously rebuilt by Richard's army, had been pulled down, leaving the city defenseless. Other cities formerly in the Latin Kingdom were also in Muslim hands; these places were important either because they were feudal holdings their Crusader lords could not control or have access to, because they were episcopal sees the Latin bishops could not reside in, or both. Among the major examples there were, besides Ascalon, Bethlehem, Nazareth, Sidon, and Beirut. In light of this situation and the time limit on the truce, what would happen when the treaty lapsed?

The response to these circumstances, in view of the partial success and the partial failure of the Third Crusade and the fact that Jerusalem and other holy sites were still in Muslim hands, was for the pope to call for a new Crusade. In fact, there was a whole series of new Crusades. Henry VI Hohenstaufen organized a new Crusade in 1195–7, what is sometimes called the German Crusade. Innocent III, the newly elected pope in 1198, called for another new Crusade – the ill-fated Fourth

Crusade – to the East as soon as he took office. Popular sentiment in Europe generated a movement known as the Children's Crusade in 1212. The call for the Fifth Crusade was on the agenda of the Fourth Lateran Council in 1215 and had been one of Innocent III's last acts before he died. Yet despite this prodigious outpouring of Crusading endeavors, the results were disappointing in the Latin Kingdom between 1192 and 1219. In 1192, on one hand, Ascalon was removed from Crusader control and had its walls dismantled. In 1210, on the other hand, Jerusalem, which had remained in Muslim hands through this entire time, was no closer to Christian control, and by 1219 the Holy City also had its fortifications taken down by order of the Emir al-Mu'azzam, along with those of the towns and castles of Toron, Banyas, Safed, and the castle on Mount Tabor.[2]

The loss of Jerusalem and the other major holy sites in 1187 and the relatively precarious situation of the Crusaders in the Holy Land in 1192 are clearly the causes that generated this unprecedented run of Crusade expeditions. What were the results of these Crusades on the Latin Kingdom and the other Crusader States, that is, the County of Tripoli and the Principality of Antioch? How did the situation change in the Latin Kingdom and its former territories between 1192 to 1210? Finally, what impact did these developments have on the artistic activity of the Crusaders in the Holy Land? What art was produced in the Crusader States between 1192 and 1210? What art was exported from or imported into the Crusader States in those years?

The outlook for the Crusaders in the fall of 1192, following the departure of Richard I for the West, was unclear, even if Richard may have expressed his intention to return to the Holy Land to Henry of Champagne.[3] Saladin led a unified Ayyubid Sultanate, which virtually surrounded the three separated Crusader States, and only internal dissension prevented the Ayyubids from renewing their offensive against the Franks. Henry's immediate task, however, was to consolidate his position as ruler, a challenge made more difficult by the fact that he was never formally crowned, but only ruled as lord by the authority of his position as husband to Queen Isabel.[4] They had been married in Tyre, but resided in Acre, and Acre came to be identified as the de facto capital of the newly reconfigured Latin Kingdom, reestablished by the Treaty of Jaffa. Jerusalem, the traditional location for the coronation of the kings of Jerusalem since 1131, was obviously no longer accessible for this purpose. In any case the lack of royal investiture limited Henry's power. The regalia, which was presumably now deposited for safekeeping in the cathedral church of Tyre, had never been gotten out for the ill-fated Conrad of Montferrat and Isabel and, although we assume it was available, was never employed for Henry and Isabel.[5]

There were a number of issues that Henry had to deal with, crowned or not. He was faced with controlling the aggressive Pisan commercial interests in the major port cities and their political interests in Tyre, the latter on the part of Guy de Lusignan, who though not crowned, now styled himself as king on Cyprus. This produced direct confrontation in the spring of 1193, and Henry was forced to expell the Pisans outside the kingdom, except for a colony of thirty in Tyre. He also tried to imprison Aimery de Lusignan, the constable of the kingdom, who attempted to intervene on behalf of the Pisans and in the interests of his brother. In the end Henry was persuaded to free Aimery by the count's major supporters, including the grand masters of the Hospitallers and the Templars. Aimery took the opportunity to leave Acre immediately for Jaffa, where another brother, Geoffrey de Lusignan, was in charge; eventually Aimery retired to Cyprus with Guy.[6]

While Henry was fully occupied with these and other internal affairs of the kingdom, it was his great good fortune that Saladin, weakened by the exertions of his vigorous military campaigns and recent ill health, died on 4 March 1193 in Damascus. In keeping with Muslim custom, the dead Sultan

> was carried out in a coffin draped simply with a length of material procured, like the other materials needed to shroud him, by the qadi al-Fadil from permitted sources known to him. When the men saw the dead Sultan being borne away, voices and lamentations rose on high.... Then the body was carried back to the palace in the garden where he had lain during his illness and was buried in the west pavilion. He was laid in his tomb at about the hour of the evening prayer; God sanctify his spirit and illumine his sepulchre![7]

Sultan al-Malik al-Nasir Salah al-Din Yusuf ibn Ayyub was dead.

> The day of his death was a day of grief for Islam and the Muslims, the equal of which they had not known since the days of the right-guided Caliphs. The citadel, the city and the entire world was overcome with a grief beyond words, and, by God, I had heard before of people who have desired to ransom those dear to them with their own lives, and had thought it just a figure of speech, not to be taken literally, but on that day I knew that if it had been possible to ransom him with our lives I and several others would have been ready.[8]

No Crusader was present to honor the man who had been their most feared and respected adversary. Dead at age fifty-four, Saladin nonetheless had outlived all of the last five Crusader kings in years.[9] Strangely, the Old French continuations record the year of his death quite mistakenly, several years after the fact, in 1195 or even 1197, indicating apparently that their authors received word of his passing quite late.[10] Nonetheless, although his brother and his most powerful sons would reign after him and although all the emirs in Damascus had taken an oath to al-Afdal,[11] his son and heir to rule in Damascus, once again serious divisions quickly emerged in the Muslim confrontation states surrounding the Crusaders. By this single event, the death of one of medieval Islam's greatest leaders, Crusader fortunes suddenly took a decidedly positive upward turn. Reflecting on "what might have been," however, recall that Saladin died only six months after the Treaty of Jaffa. Had Richard I not felt compelled to conclude that treaty and been able to hold on for another six to nine months, the outcome of his Crusade, and the fate of the Holy City of Jerusalem, might well have been very different.

Even if Henry had not known of Saladin's demise immediately, he benefited right away by the diversion of Ayyubid attention away from the Franks because he had so many problems of his own to deal with. In the Latin Kingdom, he appointed a new constable, John of Ibelin, to replace Aimery, who was now in Cyprus. Meanwhile a new patriarch of Jerusalem had been elected by the canons of the Holy Sepulcher without Henry's knowledge or permission. Greatly displeased, he imprisoned the canons, but archbishop Josias of Tyre, his chancellor, persuaded him to release them with an apology. When Celestine III sent the pallium from Rome to the new patriarch, the pope also took the occasion to admonish Henry over his rash conduct. Furthermore, after he was consecrated in office the new patriarch, Monachus, formerly archbishop of Caesarea since 1181, would obviously not have been inclined to cooperate in seeing that Henry become crowned.[12] Arrangements for the coronation of the king of Jerusalem would have to wait for Henry's successor. Despite this somewhat rocky start, however, relations between the rulers of Jerusalem and the Latin church improved and remained cordial in the new "kingdom of Acre."[13]

An opportunity for improving Henry's political standing as ruler of Jerusalem occurred in May 1194 with the death of Guy de Lusignan on Cyprus.[14] Guy had bitterly resented his removal from the kingship of Jerusalem in 1192, following the death of his wife, Queen Sibylla. Even after Richard I arranged for him to take control of Cyprus, he harbored his claim to be king of Jerusalem. Evidence for this is to be seen in his coinage on Cyprus which includes issues inscribed "+REX GVIDO D" on the obverse, and "+ E IERVSALEM" on the reverse, along with those inscribed "REX GVIDO" and "+DE CIPRO," respectively.[15] Guy's death now removed Henry's primary and most dangerous co-claimant.

Guy had designated his younger brother, Geoffrey, to be his successor, but Geoffrey had declined and returned to the West. Therefore Aimery, Guy's elder brother, was chosen by his vassals. Although Henry obviously would have preferred some other choice and hesitated at first to recognize Aimery as the rightful heir, he could see the importance of harmonious relations between Cyprus and the Latin Kingdom. Already a number of Franks, both nobles and merchants, had joint holdings on the island and the mainland, attracted there by Guy. It would be essential for the future of the Latin Kingdom that Crusaders continue to come to the Holy Land and to settle there as well as on Cyprus. With the hope of fostering prosperity and growth in both states, Henry agreed to recognize Aimery de Lusignan as the legitimate successor of Guy de Lusignan as lord of Cyprus and his primary Frankish ally in the Levant. To cement their alliance they planned a remarkable wedding between the three young sons of Aimery, Guy, John, and Hugh, and the three young daughters of Isabel, Maria, Alice, and Philippa.[16] In fact when they came of age, in 1208, only Hugh was left among the three sons, and he married Alice. But even this one marriage would establish needed bonds between the two families that in time would bear what Runciman aptly called "dynastic fruit."[17]

Meanwhile, Henry had also gotten himself involved in Antiochene-Armenian affairs and current disputes.[18] In 1193 Levon II of Armenia had invited Bohemond III of Antioch to Baghras, whereupon he took him and his family prisoner and incarcerated them in Sis. Baghras Castle had been captured by Saladin from the Templars in 1191, and he then proceeded to dismantle the fortifications, as he had done to so many Crusader strongholds in the south.[19] When Saladin left, Levon occupied the castle, rebuilt it, and claimed it as his own. Despite Bohemond III's demands that the castle be returned, Levon retained it, and Bohemond's visit in October 1193 was presumably to discuss and resolve the situation. We can only imagine what happened in their meeting at Baghras to cause what appears to be such a breach of hospitality with such a violent result. With Bohemond in prison at Sis, Levon boldly demanded Antioch in exchange for his freedom. When Bohemond agreed and Levon sent troops to occupy the city, the Greek and Latin citizens revolted, expelled the Armenian usurpers, and sent messengers to Henry of Jerusalem and Bohemond of Tripoli for aid.

In the time-honored manner of Crusader rulers during the twelfth century, Henry responded to the appeal despite his problems elsewhere and went to Antioch to arbitrate the dispute. For the good of the Crusader States he sailed immediately to Tripoli, from which Bohemond, second son of Bohemond III, had already gone north to Antioch. Riding north also, Henry stopped first at the Assassin Castle of al-Kahf northeast of Tortosa. There, the new leader of the sect, successor to the Old Man of the Mountain, welcomed him seeking to establish cordial relations after the assassination of Conrad of Montferrat. Henry was shown warm hospitality and went away with "biaus joyaus et de riches."[20] Henry continued on to Antioch and then to Sis where he opened peace negotiations among the aggrieved parties. The details of the peace settlement need not concern us here except for the fact that Levon II retained control of Baghras and Bohemond III was released without ransom. The important result of this whole episode, however, was the fact that Henry achieved important new stature in his position as ruler of Jerusalem. But trouble loomed ahead. The truce agreed on in the Treaty of Jaffa was about to run out for the Latin Kingdom, and major political developments that would change the balance of power in the Frankish East were underway.

Count Henry of Champagne had apparently accepted his status as lord but uncrowned ruler of Jerusalem, but both Aimery de Lusignan on Cyprus and Levon II in Cilician Armenia had decided that their ambitions for rule required formal coronation as king. This Henry obviously could not give them, the Byzantine emperor apparently would not give them, and, for different reasons, they were unwilling to ask for it from the pope, so they both, separately and independently, approached the Holy Roman emperor, Henry VI Hohenstaufen, with this request.

In the fall of 1195, Aimery's envoy, Renier de Gibelet, presented his request and did homage for Cyprus to the emperor in Germany on behalf of Aimery.[21] Henry VI, who was in the process of organizing a new Crusade, willingly agreed to crown Aimery when he came east. In the spring of 1196, as a sign of this agreement Henry VI sent two envoys, the archbishops of Brindisi and Trani, with a royal scepter and possibly other regalia.[22] When Henry VI fell ill and could not lead his Crusade, he delegated the coronation into the hands of his imperial chancellor, Conrad, bishop of Hildesheim, who also became head of the expedition. Conrad arrived on Cyprus and Aimery was duly crowned in Nicosia in September 1197, the same month that Henry VI died in the West.[23] Aimery de Lusignan had now become King Aimery I of Cyprus. Count Henry of Troyes, ruler of the Latin Kingdom, was conspicuously absent at the ceremony.

Meanwhile, Levon II's request for coronation met a much less ready response. At first, Henry VI was not willing to crown someone he did not know who was not even in communion with Rome. But when Levon II therefore approached the pope with the idea of Armenian ecclesiastical submission to Rome, Henry VI changed his mind. Henry decided he would agree to crown Levon II in exchange for recognition of his suzerain rights over Cilician Armenia. Before the German emperor could send his delegates east, however, the Byzantine emperor, Alexius Angelus, had also sent Levon II a royal crown. Nonetheless, in January 1198, shortly after leaving Cyprus, Conrad of Hildesheim journeyed to Sis with Conrad, archbishop of Mainz, the papal legate, to conduct the ceremony on behalf of the German emperor. It must have been a remarkable ritual with the German catholic archbishop, Conrad, and the Armenian catholicus, Gregory Abirad, investing the new king in the presence of the papal legate, the Orthodox archbishop of Tortosa, the Jacobite patriarch, and Muslim ambassadors in attendance. Few Crusader kings would ever be crowned in such multicultural splendor.

Again Count Henry of Troyes, ruler of Jerusalem, was conspicuously absent.[24]

Henry of Troyes was absent at these two momentous occasions because on 10 September 1197 he had fallen to his death from a window of the palace in Acre. In a moving passage, the Lyon Eracles describes how shocked Isabel was when she heard the news and how deeply she grieved.[25]

Befitting his status as ruler, Henry was laid in state in the church of the Holy Cross. Then the text reports: "Sa sepulture est en une des eles de l'yglise, pres de la porte, qui est devers le Change."[26] This means that his tomb was placed in the south aisle of the Church of the Holy Cross near the door leading toward the exchange, that is, the south portal.

The Latin Kingdom therefore not only was suddenly without a ruler, but it was also rendered leaderless for the third time in five years, just when two potential Christian allies were receiving new royal status. Queen Isabel was understandably distraught, again. Furthermore, as was the case when her second husband, Conrad of Montferrat, was assassinated, she would have to remarry to provide the kingdom with a new ruler, and she would have to remarry very quickly. Among the strongest candidates considered by the High Court, the Hospitallers and the Templars favored Aimery de Lusignan, but Monachus the patriarch was opposed.[27] As the discussion continued, the German Crusaders arrived from Cyprus led by Bishop Conrad of Hildesheim. When Conrad was apprised of the situation, he also put forward the name of Aimery, new king of Cyprus.

Aimery de Lusignan had impressed the resident Crusaders in the Latin Kingdom with his leadership ability, demonstrated especially by his handling of affairs on Cyprus since the death of his brother in 1194. Conrad could see the advantage of Aimery to his imperial German lord. Having accepted the new royal crown of Cyprus from Henry VI, and by becoming king of Jerusalem with the support of the imperial chancellor, as Conrad saw it, Aimery would also bring the Kingdom of Jerusalem under the lordship of the German emperor. Aimery was offered the crown and agreed. He came to Acre in January 1198.

Aimery married Isabel in a ceremony that apparently took place in Acre, presumably in the Church of the Holy Cross.[28] Then the newlyweds were crowned king and queen, Aimery II[29] and Isabel, of the Latin Kingdom of Jerusalem by the patriarch, Monachus, apparently in Tyre.[30] The continuations all point out that Isabel, for all her involvement in the succession since 1192, was finally crowned queen, for the first time![31] The sources in fact do not say explicitly where these ceremonies occurred, but the events in the text immediately prior to the report of the wedding and the coronation took place in Acre. It therefore appears reasonable and possible to interpret the wedding to have taken place there, in the de facto capital of the kingdom, with the coronation in Tyre, the second city of the kingdom after Jerusalem in terms of ecclesiastical rank.[32] Suddenly, along with these events – the death of the ruler and the election of a new king – the Crusaders had had to deal with where, how and when to stage the burial, a wedding, and the coronation. Jerusalem was unavailable. Acre appears to have been the expedient choice in these circumstances for the burial and the wedding ceremonies. Tyre was the choice for the coronation.

The exigencies of the moment were pressing indeed, so these expedient choices had to be made. The Crusaders had had to face several emergencies at once. Moreover, the first contingents of German crusaders set in motion by Henry VI and nominally led by Conrad of Hildesheim and Conrad of Mainz for him were arriving in the Latin Kingdom during September 1197.[33] They were intent on engaging the enemy at once, with or without the cooperation of the ruler of the Latin Kingdom. Alarmed by the German advance, however undisciplined, the Emir al-Adil had responded by organizing his own army in the field and marching on Jaffa, which was under the command of the ineffective Raynald Barlais. Henry of Champagne was in the process of organizing his troops to go to the aid of Jaffa when he accidentally fell from his palace window and died on 10 September.

The main German contingent reached Acre on 22 September. Henry, duke of Brabant,[34] a recently arrived Crusader, stepped in as interim commander and prepared to go south to reinforce Jaffa. News that Jaffa had fallen to the Muslims reached the Crusaders just as Henry of Brabant set out. Regrouping and consulting with the new king-elect, Aimery and Henry of Brabant jointly devised a new strategy designed to reconnect the territory of the Latin Kingdom with the County of Tripoli. Henry led the German Crusaders northward along the coast to secure Tyre, to recover Sidon, and to besiege and retake Beirut and its environs. The German army also attacked the Crusader castle of Toron, inland east of Tyre.

The Crusader campaign up the coast was successful: Sidon, which had been demolished and largely abandoned, was reoccupied, and Beirut, whose walls were partly taken down by the Muslims, was captured with the city largely intact at the end of October 1197. The castle of Toron was besieged in late November. Now word of the death of Emperor Henry VI in Messina on 28 September had reached Palestine, however, and as the days went by, an increasing number of the German soldiers became anxious to return home. The siege was broken off at the start of February 1198, and Toron was never taken. The hope that this Crusade might succeed in attacking and capturing Jerusalem where the Third Crusade had failed had to be abandoned.[35] Most of the German Crusaders reembarked for western Europe in February 1198.[36]

When peace had been restored, King Aimery entered diplomatic negotiations with Emir al-Adil. Eventually a treaty was signed on 1 July 1198 in which the Muslims retained Jaffa and the Crusaders controlled Beirut and Gibelet; Sidon was dealt with as a condominium. This truce was to last for five years and eight months.[37] The German Crusade was over, much to the relief of King Aimery. This expedition had demonstrated how difficult it could be to control a Western army in the Crusader East, particularly one without its real commander. Moreover, the immediate results of the Crusade were modest at best with the recovery of Beirut as the main accomplishment. The primary long-term contribution to the Latin Kindom was the establishment of a permanent organization of the Teutonic Knights, modeled along the lines of the Knights Hospitallers.[38] The failure of the German Crusade to reconquer Jerusalem meant that another new Crusade would be needed, however. On 8 January Innocent III was elected pope, on 22 February he was consecrated, and in August 1198 he proclaimed the new Crusade.[39]

1197–8 was a momentous year during which the whole political structure of the Frankish East had been reconfigured, just when Innocent III would begin to reshape the papacy in the West and reorganize the whole machinery and administration of the Crusade movement. Within a few months of each other – September 1197 and January 1198 – two new royal figures, King Aimery de Lusignan on Cyprus and King Levon II of Armenia, had emerged in the Frankish levant under the overlordship of the German Holy Roman Emperor. Then Aimery joined the kingship of Cyprus with that of the Latin Kingdom of Jerusalem, becoming Aimery II, also in January 1198. Instead of the independent royal stature of the king of Jerusalem as established in the early twelfth century with the coronation of Baldwin I in 1100 at the hands of the Latin patriarch of Jerusalem, Aimery II was now king of Jerusalem under different circumstances. He was elected by the High Court and supported by his vassals, crowned by the patriarch of Jerusalem, but with the Hohenstaufen shadow looming over the office and the inheritance. Whereas before 1187 it was the Byzantine emperor who was the primary imperial adversary and potential ally for the king and barons of Jerusalem, from 1198 to 1250 and beyond the Holy Roman emperor in the West would assume that role.[40] Moreover, it was impossible for the new king of Jerusalem and Cyprus – Aimery II of Jerusalem who was also Aimery I of Cyprus – or the new pope, Innocent III, to foresee the power struggle looming on the horizon between the papacy and the Hohenstaufen emperors, or what remarkable role the Kingship of Jerusalem would play in that confrontation.

With the coronation of Aimery II and the strengthening of the kingdom by the reoccupation of Sidon and control of Beirut by the German Crusade, the Latin Kingdom was in the process of reestablishment under somewhat new circumstances. In fact this process had been underway since the recapture of Acre in 1191 and the treaty of Jaffa in 1192. This reconfiguration extended to the ecclesiastical establishment as well. With the consecration of a new patriarch, Monachus, in 1194, it was possible for him to begin the reorganization of the Latin church.[41]

Monachus had relocated his own see to Acre, utilizing as his pro-cathedral the Church of the Holy Cross, which was simultaneously the cathedral of the bishop of Acre. This situation was feasible because the patriarchate possessed extensive resources in the West, and some property in the Latin Kingdom currently controlled by the Crusaders. Monachus also appointed new Latin bishops to the sees of Bethlehem and Nazareth, because of the importance of these sites as holy places. The Crusaders did not control these sites, which were in Muslim hands at this time, but as in the case of the Church of the Holy Sepulcher, both churches, at Bethlehem and at Nazareth, had extensive holdings in the West. These properties produced the necessary income to support a bishop and a group of canons in each case. New bishops were also appointed to the sees of Beirut, Sidon, Caesarea, and Lydda between 1198 and 1202. This meant that by the time the patriarch, Monachus, died in 1202, the Latin hierarchy for the Church of Jerusalem had been reestablished as it had existed before 1187 at the time of King Amalric I, that is, 1163–74. Underneath the patriarch, there were three archbishops, at Tyre, Nazareth, and Caesarea, and seven bishops, at Acre, Beirut, Bethlehem, Lydda, Sebastia, Sidon, and Tiberias.[42]

Despite the arrangements already noted, which were made with the optimistic expectation of Western aid and the recovery of the lost territory of the kingdom in the near future, this reestablishment was not without its problems. The obvious difficulty was the fact that the original ecclesiastical boundaries of the various dioceses did not match the current political boundaries, which were much shrunken. Typically, a diocese consisted of a large slice of territory running from the coast inland to the Jordan Valley.[43] Furthermore, even when the Crusaders controlled part of a diocese along the coast, it was often the case that the cathedral city was in Muslim hands, inland. These circumstances required certain officials, in particular, the patriarch, the bishops of Bethlehem, Nazareth, Lydda, Tiberias, and Sebastia to live elsewhere. Some (e.g., the bishops of Bethlehem and Lydda) lived for extended periods in the West; others moved into Acre. The bishop of Acre was suffragan to the archbishop of Tyre but was overshadowed in Acre by the presence of the patriarch living there and using his cathedral church.

The presence of the patriarch of Jerusalem in Acre also meant that other exiled bishops and religious communities were attracted there as well. In fact an astonishing number of clergy and religious from the various shrine churches in Jerusalem had relocated there: one finds the Austin canons of the Templum Domini, of St. Mary on Mount Sion, and from the Mount of Olives; there were the Premonstratensian canons of St. Samuel's, the Benedictines of St. Mary in Jehosaphat and at Santa Maria Latina, and the Benedictine nuns of St. Anne's and of the Convent of St. Lazarus in Bethany, among others, all in Acre.[44] Overall the hierarchy as reconstituted was, as Hamilton points out matter-of-factly, far in excess of the needs of the Frankish population in the Latin Kingdom at this time, and a large number of church officials were forced to live in Acre. The result was that the members of the hierarchy and the religious communities of the Latin church in the Patriarchate of Jerusalem were somewhat dislocated and increasingly dependent on resources in the West.

Even if the main institutions and the clergy of the Latin church moved from Jerusalem to Acre along with the political institutions of the kingdom after the Third Crusade, Acre was a very different place compared to Jerusalem for several reasons. First, Acre was a major commercial center with an important port, the most important center under Crusader control on the coast of Syria-Palestine. This meant that the most significant maritime powers had quarters and facilities here, including their own special churches: St. Peter for the Pisans, St. Lawrence for the Genoese, and St. Mark for the

Venetians. Second, Jerusalem was obviously a major holy place, whereas Acre was not. Along with the Church of the Holy Sepulcher, Jerusalem was filled with other shrines, churches, monasteries, and convents which pilgrims wished to visit. In its new configuration Acre also became filled with more than fifty churches, but it was never really a focus for pilgrimage itself, only a waystop for pilgrims en route to pilgrimage sites. Third, one of the distinctive characteristics of Jerusalem was the multicultural richness of the oriental Christians who inhabited the city. When the Latin Christians left Jerusalem in 1187, many of these oriental Christians remained in the Holy City.[45] True, there was an Orthodox bishop and a Jacobite bishop in Acre during the thirteenth century, along with a substantial population of Syrian Orthodox and Syrian Jacobites. In any case, compared to Jerusalem in the twelfth century, Acre after 1192 and in the thirteenth century became a remarkably cosmopolitan Frankish commercial city, with a relatively larger Frankish population in relation to the numbers of eastern Christians, in contrast to what the situation in Jerusalem had been.[46]

There is also the consequential matter of the military orders.[47] Both the Hospitallers and the Templars had assumed roles of major importance in the kingdom during the Third Crusade, recuperating quickly from their devastation at the battle of Hattin. They both relocated their headquarters to Acre, along with other smaller orders such as the knights of St. Lazarus, and the new English order of St. Thomas of Canterbury, founded in 1190 from London.[48] Also the Teutonic order had been newly founded in Acre in 1198.[49] These orders were now functioning as independent international organizations; they were not vassals of the king of Jerusalem nor did they take an oath of obediance to the patriarch of Jerusalem.[50] Thus their substantial presence in Acre constituted an additional feature in making St. Jean d'Acre the most cosmopolitan Frankish city in the eastern Levant.

Finally, Acre was the most important if not the only commercial center for the Latin Kingdom. Tyre, Tripoli, and Antioch were the only other Crusader centers of comparable significance on the coast of Syria-Palestine. The difference was that whereas Acre was focused on trade and commerce, Tyre, Tripoli, and Antioch were the main Crusader centers of production, and they were quite well known for certain products.[51] This means, too, that the major maritime powers had a significant presence in Acre to deal with shipping, transit, finance, import, and export, something Jerusalem basically did not have, but that Tyre, Tripoli, and Antioch also had to a lesser extent. For this purpose Acre possessed separate quarters for the Pisans, the Genoese, and the Venetians.[52] Two other groups had similar independent rights and status in Acre, the Marseillaise, along with others from southern France, including merchants from Montpellier, and Barcelona also had a quarter.[53] But certainly the Italians were the most important here; their quarters contained residences apart, national churches, and unique access to ovens they controlled. The Pisans and the Venetians had their own markets, and they along with Genoa had special trading privileges. The merchants from Marseilles and Barcelona basically only had access to their own market. Even in the largest Italian quarters, the numbers of people who were permanent residents probably never exceeded five or six hundred in Acre.[54] But these merchants and their families were a significant presence in the city because of their economic power and the fact that they could inherit property outside their communal quarters. They definitely were a major feature of the multicultural character of the city.

In addition to the international commerce, there was also the commerce carried on in terms of local trade and local crafts.[55] It is within the latter that we can no doubt locate much artistic activity of the period, such as metalwork, goldsmiths work, book painting, ivory carving, and sculpture. Other crafts, such as ironwork, textile production, and pottery and glass making, were also important. Much book painting, and book production in general, was surely still carried on in ecclesiastical locations such as the scriptorium of the Holy Sepulcher, presumably now transferred to the Church of the Holy Cross, and in various monastic houses or in the convents of the military orders. So, too, was found icon painting, no doubt in Orthodox monasteries, such as the Monastery of St. Catherine in Acre, but also quite possibly some panel painting was done in Latin institutions as well, probably by members of some of the religious congregations transferred to Acre from Jerusalem. Some painting probably also began to be done outside of church institutions, and as in Jerusalem, other craftwork was mostly produced by laypeople. Trade and local crafts were carried on by Franks, Eastern Christians, Muslims, and Jews in the open marketplace, effecting the interface between the Crusaders and the indigenous population, obviously not all of which was Christian. In these circumstances of multicultural artistic and economic interchange, there do not seem to have been guilds for artisans and craftspeople, except perhaps among the Italians, unlike the situation in Western towns.[56] Workshops here were apparently different with a combination of resident and transient artisans working together in settings that seem to have encouraged interactive conditions and stimulated intercultural exchange to some extent. Precisely the factors of common "national" or city origin and religion that were features of the guilds in the West would not have been found in the ateliers of Acre, except inside the Italian quarters.

In this setting, the resident Frankish aristocracy and the Latin church officials formed the major class of Crusader patrons in the city of Acre and elsewhere, mostly in the cities, in the Latin Kingdom. Among transients, there were pilgrims and travelers on a more or less constant basis, although their numbers fluctuated according to conditions of access; there were also from time to time new Crusaders from the West who came with each expedition. These latter three categories were mostly all temporary visitors. But new patrons among the permanent or long-term residents were also developing, among which we can think not only of the important burgesses and well-to-do merchants (e.g., Italian merchants in their quarters, some of them even members of the aristrocracy[57]) as individuals, but, also members of new confraternities that had started to form.[58] Like their counterparts in Italy, these confraternities were sometimes organizations dedicated to works of charity, but in the Latin Kingdom their special function was to aid in the defense of the Holy Land.[59] The earliest known confraternities in the Crusader East were the confraternity of Sts. Andrew and Peter, also known as the confraternity of St. Andrew or the confraternity of Acre, and the Societas Vermiliorum. The former was founded by 1185 in Jerusalem, but moved to Acre where its privileges were renewed by Count Henry in the 1190s.[60] The latter was a Pisan organization formed to help defend Tyre against Saladin in 1188.[61] Later on we find other such confraternities such as the Italian Brotherhood of the Holy Spirit in 1216,[62] and organizations for Spaniards, Englishmen, Greek Orthodox, and even Nestorians from Mossul, among others.[63] Besides their activities to aid the Holy Land of Jerusalem and to do good works, these organizations were also important politically, as, for example, the Confraternity of St. Andrew during the commune of Acre between 1232 and 1244.[64] Because of the language of their statutes it is clear that these *confratres* saw themselves as Crusaders, and because of their stated purpose to aid and succor the Holy Land, their organizations functioned mutatis mutandis as military orders mostly for laypeople, parallel in certain ways with the Hospitallers and the Templars.[65] They must have also been corporate sponsors of works of art.

Outside of Acre and the other towns of the kingdom, the necessary agriculture was carried on by a combination of Franks, local Christians, and Muslims.[66] Crusaders controlled certain agricultural lands and their settlements included villages both fortified and unfortified, manor houses, seignorial strongholds, and flour mills. In addition there were a few settlements where the Franks mixed with local Christians. Although the agricultural activity was obviously essential for the welfare of the kingdom, little artistic activity appears to have taken place in the rural hinterlands, other than in certain castles, as we shall see. Some Frankish owners of the farming properties must have been absentee landlords, many if not most living in large cities such as Acre, Tyre, Tripoli, or Antioch. But it is clear there were numerous Frankish settlers in the rural countryside controlled by the Crusaders and landlords lived mostly in their fortified holdings. Nonetheless, the identifiable artistic patronage of the landowning classes, be they nobles, ecclesiastical institutions, merchants, or military orders, appears to be found primarily in their castles or in the cities. Acre now was to be the most important city in the Latin Kingdom of Jerusalem between 1191 and 1291, but not the only city of importance.

In sum, St. Jean d'Acre by 1198 was newly flourishing as the de facto capital of the Latin Kingdom. Furthermore, Acre represented an important aspect of Crusader life, the rise of the city, that is also found in western Europe at this time.[67] Not only was Acre – the city – newly important because of the relocation of institutions there, but also because of the growth of its population.[68] Acre alone, compared with the other major centers, including Antioch, Tripoli, Tyre, or even Beirut, was developing a new suburb along the north wall, where many non-Frankish citizens lived. This suburb, known as Montmusard, at first was not defended by a wall, but later it received a single and then a double wall like the rest of the city.[69] From inside the heavily fortified walls of the older part of the city, the king attempted to manage the political affairs of the kingdom. The patriarch directed the ecclesiastical affairs of the Latin church. The military orders, especially the Hospitallers and the Templars, in effect controlled the military defenses of the kingdom, as well as those of the northern Crusader States, in terms of the large number of important castles they held and the fortifications of Crusader cities for which they were responsible. The words which the Armenian ruler was reported to have spoken to King Amalric I in the 1160s were also applicable in the 1190s:

> Sire, dist Thoros au roy, quant je vinç parmi vostre tiere, et je demandois des castiaus cui il estoient, li uns me disoit: 'C'est del Temple'; li autres: 'De l'Hospital'; . . . Si que jou ne trouvai ne castiel, ne cité, . . . qui fust vostre, ne mais seulement.III., mais tout à Religion.[70]

Of all the castles in the Crusader States, he could find only three that belonged to the king; the rest were controlled by the military orders. A similar situation existed in 1198 except that the overall number of castles controlled by the orders had been reduced by Saladin's conquests. Meanwhile trade and commerce flourished in Acre, and in the Crusader Kingdom, and some of the constant challenges for the king consisted of maintaining order among the maritime powers. He had sometimes to quell wars, to negotiate tax privileges with the various commercial powers and maintain vigilance over political activities they participated in, for the purpose of increasing their power and influence, and the power and influence of those political figures they supported.

The years between 1198 and 1205 were no less consequential for the Latin East than 1197–8 had been, but the difference was that, on the whole, developments in those eight years had a negative impact on the Crusader States in the Holy Land. With his call for a new Crusade in August of 1198, Innocent III had put the Levant on notice that a major new military expedition would be coming eastward. Unfortunately, except for the tangled developments in the north concerning the Antiochene succession after the death of Bohemond III of Antioch in April 1201, this new Crusade overshadows developments in the Latin East. Even sources such as the various continuations of William of Tyre's *Histoire d'Outremer* (e.g., the Paris Eracles) and the Chronicle of Ernoul focus mainly on events of the Fourth Crusade, not on developments in the Latin Kingdom. What significant developments were there in the Crusader States of the Latin Kingdom, the County of Tripoli, and the principality of Antioch in those years? What impact did the new Crusade, the ill-fated Fourth Crusade, have on the Frankish East?

One of the most consequential aspects of the reestablishment of the Latin Kingdom was the commencement of the compiling of the *Assises de Jérusalem*, an artificially created library of different books. The first book to be written was the *Livre au Roi*, which was done during the time of Aimery II, that is, 1197–1205.[71] It is the first of the great legal treatises written by the Crusaders in the thirteenth century.[72] Although this was probably Aimery's most important effort toward the strengthening of the king's legal position in the Latin Kingdom, he did not attempt the obvious measure to increase its political power. At an early moment he made the decision not to combine the crowns of Jerusalem and Cyprus, maintaining them separately in terms of courts, finances, and military resources. This policy would be followed all through the thirteenth century by his successors. What of course did happen is that very cordial relations were established between the Latin Kingdom and Cyprus. The Latin Kingdom benefitted from time to time by resources drawn from Cyprus, but Cyprus also drew Franks away from Syria-Palestine because of its more secure situation and the economic and commercial advantages which it offered.[73]

Among his royal responsibilities, Aimery II was forced to deal with the effects of a major earthquake which occurred in

Syria in 1202.[74] This was the most serious quake of the thirteenth century.[75] By this time most of the rebuilding of the fortifications taken down by Saladin in his campaigns of 1187–8 would have surely been completed. But this earthquake was severe enough to inflict serious new damage on Crusader structures and force the Crusaders to return to the arduous task of reconstruction yet again. Specific projects that are mentioned include the king's residence in Acre; and the city walls and towers, churches, and domestic dwellings of Acre, Tyre, Beirut, Gibelet, and Tripoli, among other sites, including the two great Hospitaller castles of Crac des Chevaliers and Margat; and the Templar castle of Chastel Blanc. Referring to the destruction at Tyre in his letter, Geoffrey of Donjon, a Hospitaller, describes the destruction of walls, churches, and domestic dwellings, "Tirus, . . . , in muris et turribus, ecclesiis et domibus tantam passa est eversionem, ut nullus hominum iam vivens eius possit expectare vivendo restauracionem."[76] To say that people would not live to see the rebuilding completed in their lifetime seems to have been a figure of speech for how great the damage was. But it is certain that the reconstruction of walls, towers, churches, palaces, domestic dwellings, and castles must have taken a long time, perhaps many months for the fortifications and even several years for the nonmilitary structures.

Aimery himself was personally involved in a few minor military activities during these years, which are mentioned in the continuations between accounts of the Fourth Crusade. He sent out ships to retaliate against a Muslim pirate, capturing a convoy of ships sailing for Lattakieh. He also conducted a raid into Galilee going as far as Mount Tabor, and he sent a Crusader fleet south into the Nile delta, past the town of Rosetta to Fuwah.[77] This attack on the delta was the precursor of a number of unsuccessful Crusader incursions into Egypt in years to come. The editors of the *Recueil des Historiens* and of Ernoul's *Chronique* date these events to 1203–4. Meanwhile the Hospitallers from Crac des Chevaliers and Margat carried out raids against Hama at about the same time.[78] Clearly the truce of 1198 was no longer being strictly honored, but both sides had heard of the new expedition being organized in the West, and neither wanted to provoke the other seriously to the point of risking open warfare with the new Crusade in the process of formation.

Meanwhile, Aimery II continued to be concerned about Antiochene problems, much as Count Henry and his twelfth-century predecessors as rulers of Jerusalem had been. In this case it was mainly the Antiochene succession at issue.[79] At the root of the dispute were claims and arrangements made before the death of Bohemond III in 1201. In 1197 Raymond of Antioch, eldest son of Bohemond III, had died, leaving only Raymond Roupen, his infant son by an Armenian princess, Alice. In 1198 Bohemond III, persuaded by a papal legate who was acting to strengthen the ties of a possible union between Rome and the Armenian church, saw to it that the barons of Antioch would recognize Raymond Roupen as his successor. Raymond Roupen was, however, problematic because through his Armenian linkage the new king of Cilician Armenia, Levon II, would be regent in the event of Bohemond III's death while his son was in his minority. Moreover, Bohemond, count of Tripoli, and younger son of Bohemond III, also had his own ambitions in regard to Antioch, and he did not wish to have his claim to power displaced by Armenian interests. Finally, the Templars who had lost Baghras to Levon II, sought its return from the Armenian king. Thus the Antiochene commune, Bohemond of Tripoli, and the Templars were opposed to the arrangements put in place by Bohemond III, and then Bohemond III died, in 1201.

In this situation, Bohemond of Tripoli claimed his right to be Bohemond IV by seizing power with the support of the commune and the Templars. The venerable and experienced Latin patriarch of Antioch, Peter of Angoulême, although supported by the Hospitallers, could not intervene effectively because he was constrained by the policy of Innocent III regarding union of the Armenian church with Rome. Hostilities erupted between Antioch and the Armenian king. Bohemond IV in Antioch was supported by Saladin's son, az-Zahir of Aleppo, but at that moment neither he nor the Seljuk Turks wished to become actively involved in a quarrel that involved the Christians and effectively kept their borders safe.

Meanwhile, King Aimery II watched, worried, and waited, trying to keep the peace or find a way to restore it. He leaned sympathetically toward Raymond Roupen, whom he saw as the legitimate successor, but he did not wish to confront Bohemond IV, and he did not want to get embroiled in a northern conflict when there was the threat of attack by al-Adil from the south, from Egypt. After all, al-Adil still held Jaffa and other important coastal sites farther south. As mentioned earlier, while the Fourth Crusade was underway, al-Adil had sent a raiding party into the Latin Kingdom, into Galilee; Aimery parried with a foray into the Nile delta, but both sides stopped short of breaking the truce with these incursions.[80] The promise, or threat, of the new Crusade sailing from Europe hung over Syria-Palestine in 1201–4. How would King Aimery be able to steer the Crusaders to productive use for the Latin Kingdom when they arrived in the Holy Land?

Clearly the overwhelming focus of the Latin East and the potential hope for the Frankish future of the region rested on the newly called Fourth Crusade (1198–1204). The view of this Crusade from the Latin East was, however, quite different in certain aspects from the accounts we have in the eyewitness Western sources, such as Geoffrey of Villehardouin, Robert of Clari, or Gunther of Pairis.[81] Geoffrey and Robert never made it beyond Constantinople to the Holy Land. Gunther's abbot, Martin of Pairis, did in fact go to Acre twice, en route while going and coming to Constantinople, and his account does shed some light on the Latin Kingdom in these years, but his view is still decidedly Western. Certainly no one could have predicted the fragmentary and disorganized fashion in which many of the soldiers on this Crusade made their way to the Frankish East. No one could have foreseen its short- or long-term impact on the Crusader States; and, of course, no one could have imagined its catastrophic result.

THE FOURTH CRUSADE[82]

Following the proclamation of the new Crusade by Innocent III on 15 August 1198, the administrative machinery of the Crusade got underway immediately. A tax to support the Crusade was levied on churchmen and laypeople alike. Papal legates, abbots, and priests were sent out to preach the Crusade in Italy, France, Germany, and elsewhere. For example, Soffred, cardinal priest of Sta. Prassede and eventual Latin Patriarch designate of Jerusalem, went to Venice. Martin, abbot of Pairis in Alsace, went to Germany. A country priest named Fulk of Neuilly became widely known as the most inspired, charismatic preacher in France.[83] Innocent's goal of March 1199 for having the army start out proved to be wildly unrealistic. There had been some hope that Richard I of England would be willing to take the Cross, again, but his untimely death on 26 March 1199 removed that possibility.[84]

The Crusade began to develop at a tournament held at Ecry sur Aisne (Asfeld-la-Ville) by Count Thibaut of Champagne, brother of the late Count Henry, lord of Jerusalem.[85] There on 28 November 1199, several important nobles took the Cross, including Thibaut himself, Louis of Blois, Simon de Montfort, and Renaud de Montmirail. Later, on 23 February 1200, another important group of nobles including Count Baldwin of Flanders and Hainaut and his brothers, Henry and Eustace, also joined the Crusade, taking the Cross in Bruges. It is interesting that in his lengthy listing of the nobles and knights who took the Cross, Robert of Clari, a knight of very modest means himself, identifies them as follows: "Those whom we have named you here were the richest men and they carried banners, and we have not by any means named all those who carried banners."[86] Meetings were held at Soissons and at Compiègne to work out arrangements. Six delegates were named to seek transportation among whom Geoffrey de Villehardouin[87] and Conon de Béthune were the most prominent. Conferring among themselves, they set off for Venice where they arrived in early 1201.[88]

The doge of Venice, Henry Dandolo, was very old and blind, but he was an able leader. He welcomed the six delegates and a treaty was duly worked out.[89] The Venetians would provide ships (transports and horse transports) for 33,500 men and 4,500 horses, and they would provision the army for a year at a cost of 85,000 marks of Cologne. The Venetians would furthermore join the Crusade, supplying fifty war galleys of their own and would accordingly split any spoils of war evenly with the other Crusaders. The Crusaders agreed to make payment by April 1202, and the Crusade was scheduled to sail on the Feast of Sts. Peter and Paul, 29 June 1202. No specific destination for the Crusade was named in the treaty, but the envoys and the Venetians had agreed in their discussions to sail to Egypt.[90] When the documents were approved and signed, papal approval of the treaty was sought and granted in May 1201.

When the delegates returned to France, they found Count Thibaut of Champagne seriously ill, and he died on 24 May 1201.[91] Accordingly, the Crusaders eventually decided to approach the marquis, Boniface of Montferrat, to lead the Crusade. Boniface was the brother of the late Conrad of Montferrat, who had died at Acre in 1192 before he could be crowned king of Jerusalem, and brother of the former king of Thessalonica, Nerio (=Renier).[92] The marquis could clearly see the advantages of accepting such an offer, and after conferring with his cousin, King Philippe Augustus, on this decision, he went to Soissons to meet with the Crusaders and formally take the cross as their leader.

Following the meeting at Soissons, Boniface stopped at Citeaux on Holy Cross Day, 14 September 1201. Fulk of Neuilly, the great preacher, was there. Since the time of Bernard of Clairvaux, the Cistercians had supported the Crusade movement enthusiastically and now for this Crusade, a number of prominent Cistercians were enlisted by Innocent III to join in the preaching.[93] Here, in the presence of many Cistercian abbots and monks, numerous people from Burgundy and Champagne took the Cross, and much money was collected to aid the Holy Land.[94] Boniface then proceeded to Hagenau, just north of Strassburg. There at the court of his cousin, Philip of Swabia, he met Alexius Angelus, son of the dethroned Byzantine emperor Isaac II Angelus and brother of Irene, Philip's wife.[95]

It was here in Hagenau, in the fall of 1201, that the notion of steering the Crusade to Constantinople was apparently born. This idea can be seen as the product of Alexius's plea for help in conjunction with two powerful nobles whose families had strong traditions of Crusading activity and who could envision substantial support for the newly forming expedition deriving from a Byzantine emperor they helped establish on the throne.[96] Furthermore, seen in the larger context of the strategy to attack Egypt already formulated, diverting the Crusade to Constantinople at this point would only mean a stop en route, not necessarily an end in itself. With the idea under discussion, a variety of questions remained unanswered on the part of Philip and especially Boniface. In early 1202 Alexius went to Rome to seek papal support for his cause. Innocent III was unwilling to aid Alexius Angelus, a youthful pretender to the throne with many extravagant promises, when the pope was endeavoring to persuade Alexius III, the reigning emperor, however weak and vacillating, to agree to a reunion of the Greek and Latin churches under the primacy of Rome.[97] Shortly thereafter Boniface also came to Rome to convey the support of Philippe Augustus for the coming Crusade, as well as the king's personal appeal on behalf of Philip of Swabia and the Hohenstaufen cause. At this point, Boniface apparently also took the opportunity to raise the possibility of supporting Alexius Angelus as the Crusade moved eastward. The pope reacted strongly and warned Boniface not to participate in any endeavor directed against Christian lands.[98] Along with his interest in the reunification of the Greek and Latin churches, the pope had high hopes for the success of this Crusade that he did not want to jeopardize. It is clear that Innocent heard and considered the idea of using the Crusade to assist Alexius Angelus and rejected it as dangerous, ill-advised, and completely inappropriate. Thus twice in two months he had made clear and explicit his opposition to any plan for the Crusade to threaten a Christian city.

Boniface left Rome and returned home to prepare for the upcoming expedition. Soldiers began to set out for Venice in the spring, but the date for sailing on 29 June came and went. The papal legate, Peter of Capuano, arrived only on 22 July; Boniface himself could not get there on time, and when he arrived in Venice on 15 August 1202, the situation did not look promising. Unfortunately many fewer Crusaders had arrived than expected. The Venetians, however, had fulfilled their obligations to the letter, having prepared and provisioned a magnificent fleet of several hundred vessels.

How would the Crusaders be able to meet their contractual payment with so many fewer participants than anticipated?

A variety of reasons have been advanced to explain the serious shortfall of participants.[99] Without speculating on the merits of these possibilities, the fact of interest to us here is that clearly a number of Crusaders did not go to Venice, but left from other ports en route to the East. The Paris Eracles and also Ernoul mention Crusaders who sailed for the Holy Land from Marseilles and John of Nesle, who sailed from Flanders. Geoffrey of Villehardouin discusses these early defections at some length.[100] John of Nesle[101] sailed from Flanders with Thierry of Flanders[102] and Nicolas de Mailly[103] in fine ships, some of which belonged to Count Baldwin of Flanders himself. They had promised to join the host at Venice but instead they sailed on to the East. Others went from Marseilles, Genoa, or from one of the ports in Apulia. The bishop of Autun, Count Guignes de Forez,[104] and Pierre Bromont[105] are mentioned, along with others from the Ile de France: Bernard de Moreuil,[106] Hugues de Chaumont,[107] Henri d'Araines,[108] Jean de Villers,[109] Gautier de Saint-Denis,[110] and his brother Hugues. All of these Crusaders sailed from Marseilles. Vilain de Nully,[111] Henri d'Arzillières,[112] Renaud de Dampierre,[113] Henri de Longchamp,[114] and Gilles de Trasignies[115] sailed from ports in Apulia.[116] "Ha," Villehardouin exclaims, "what immeasurable harm was caused by those who had gone off to other ports when they should have come to Venice! Had they only done so, Christendom would have been exalted, and the land of the Turks brought low."[117]

The consequence of these defections was that by the start of September 1202, only about a third of the expected number of soldiers had arrived in Venice. After everyone present had made a contribution, the Crusaders found they still owed more than half of the agreed-on sum. In view of the situation, very generous additional contributions were made by some of the great nobles to help the cause, but even after that the Crusaders collectively still owed some 34,000 marks of the 85,000 stipulated. Understanding the predicament that had arisen and naturally wishing to protect the investment the Venetians had made in preparations for the expedition, the doge sensibly proposed to defer payment of the outstanding amount until the army could achieve conquests and acquire booty to split according to the terms of their treaty. As this idea made the rounds, a concrete target presented itself in the form of Zara, an independent port city on the Adriatic. The Venetians depended on Zara for their supply of Dalmatian oak for shipbuilding and for provisioning its ships on the long voyage to and from the Levant. Zara had, however, been a thorn in the side of Venice all through the twelfth century. Since 1188 it had flirted with Pisan overtures and had placed itself under the protection of the king of Hungary, who had himself also taken the Cross, but had failed as yet to honor his vow.[118]

The proposition to attack Zara was received with mixed reactions by both the soldiers and the clergy among the Crusaders, but it became obvious that they had no choice if the Crusade was to move ahead. Meanwhile envoys from Prince Alexius Angelus had arrived in Venice in late August requesting help from the Crusaders in restoring him and his father to power.[119] In the midst of the discussion and controversy over these options, the doge, Enrico Dandolo, personally took the Cross in San Marco in a dramatic and emotional spectacle meant to express his commitment to the Crusade and help the Crusaders overcome at least their reservations about Zara.[120] In the face of these developments, Peter Capuano and Boniface of Montferrat apparently left Venice for Rome to report separately on the situation to Innocent III. The pope deplored the idea of the Crusaders attacking Zara, but he could see the practical requirements of the situation and would do nothing to damage the Crusade. So he sent a letter severely warning the army not to attack fellow Christians, but the letter only arrived after the Crusaders landed at Zara.[121] In regard to Alexius Angelus, Innocent wished the Crusade to have nothing to do with his appeal. After their meetings with the pope, Peter Capuano and Boniface of Montferrat remained in Rome and symbolically, as papal legate and leader, did not rejoin the Crusade until later.

Whatever options were being discussed by the leaders of the Crusade – the great nobles and high clergy and those who sought to use the expedition for special purposes – we should not lose sight of the fact that for the vast majority of rank-and-file participants,[122] the goal of this Crusade was Eastern lands in Muslim hands, especially the Holy Land and Jerusalem. Evidence for this can be found not only in the account of Robert of Clari, but also in a will apparently made immediately before leaving Venice by one Walframe of Gemona. Walframe leaves his estate, that is, the dowry of his wife, three houses and four slaves, as well as three hundred lire to Palmera his wife. As he put his affairs in order before leaving, Walframe states that he is "prepared to go in the service of the Lord and his Holy Sepulcher" on this Crusade.[123] Whatever intermediate stops were being contemplated and even advocated by some, the goal of the Crusade was still ultimately Jerusalem via Egypt in the minds of the vast majority of its participants.

Meanwhile the Venetians had delivered the ships and provisions to the Crusaders and the fleet prepared to weigh anchor. At the beginning of October, over three months later than planned, the Crusaders set sail. Robert of Clari was dazzled as the ships left the lagoon:[124]

> When the fleet set out from the Harbor of Venice . . . it was the finest thing to see that has ever been since the beginning of the world. For there were fully a hundred pairs of trumpets, of silver and of brass, all sounding at the departure, and so many drums and tabors and other instruments that it was a fair marvel. When they were on that sea and had spread their sails and had their banners set high on the poops of the ships and their ensigns, it seemed indeed as if the sea were all a-tremble and all on fire with the ships they were sailing and the great joy they were making.[125]

Stopping at Trieste and Pola, this impressive fleet stood offshore while the Venetians went into these cities, received their submission, and agreed on terms. On 10 November 1202 the Crusaders arrived at Zara and began a siege the next day. Two weeks later, on 24 November, the city surrendered after some heavy fighting.[126] The Crusaders entered the city and prepared to winter there. On 10 December, Boniface of Montferrat rejoined the Crusade as its leader, but by now it was clear that the overall commander of the fleet, de facto, was Enrico Dandolo.

By the end of December 1202 and the start of 1203, there were several important developments for the Crusade. First, envoys from Alexius Angelus had reached Zara with the offer of new terms if the Crusaders would assist him and his father in regaining the throne of Byzantium. Alexius proposed to subject the Greek Empire to the Roman church. He offered large sums of money and provisions for the Crusader army. In addition, he vowed to go to the Holy Land himself and bring an army of ten thousand men. Finally he promised to install and maintain at his expense a garrison of five hundred knights in the Holy Land for its constant protection.[127] Second, in a papal letter that arrived after Zara had been taken, Innocent III indicated that members of the Crusade would automatically be excommunicated for attacking a Christian city like Zara and shedding the blood of Christians.[128] It is not altogether clear exactly how the Crusade was put on notice of Innocent's stern message, but when it became a matter of common knowledge, the idea of the excommunication frightened and disconcerted many of the Crusaders, especially those who had not wished to attack Zara in the first place.[129] Third, the Crusaders possibly had now been able to make some sort of payment on what they owed the Venetians, drawn from splitting the fruits of their conquest of Zara. Surprisingly little is said about this, however, so it is not certain where the state of the debt stood. Fourth, it had now been several months since the Crusade had set out from Venice and many months since most of the soldiers had left their homes in France to start this journey. The soldiers were becoming restless and wanted to get on with the Crusade. These developments caused great discussion, dissension, and concern among the Crusaders.[130]

In general the ordinary people among the French Crusaders opposed the idea of aiding Alexius. The clergy was split. The great nobles were also divided. Villehardouin was focused on the army and does not report on the views of the doge and the Venetians. When the time came to make a decision about the proposal of Alexius, the response was far from wholehearted approval. Villehardouin reports: "I must tell you here that only twelve persons in all took the oaths on behalf of the French; no more could be persuaded to come forward."[131] Among those supporting the idea were Boniface of Montferrat, Count Baldwin of Flanders, Count Louis of Blois, the Count of St. Pol, and eight others, including Villehardouin. According to Villehardouin, the barons met with the envoys from Alexius in the "l'ostel le duc," that is, the residence of the doge, to make the decision on this proposal. Clearly, therefore, the doge must have been involved in the process and must have supported the proposal. Even though the proposal was accepted with less than enthusiastic approval, a date was set for the Crusade to sail, fifteen days after Easter. Presumably the assumption was that everyone would go along when the time came.

In the course of the winter, the Crusaders also decided to send a deputation to Rome to confer with the pope over his displeasure with the conquest of Zara. Villehardouin mentions four men, Jean de Friaize[132] and Robert de Boves,[133] along with bishop Névelon de Soissons,[134] and Jean de Noyon,[135] the future bishop-elect of Acre.[136] These four all took an oath on the Holy Gospels that they would faithfully carry out their mission and then return to the army. Of this group Robert de Boves chose to break his word and left the delegation to go to Syria.[137] Gunther of Pairis says that Abbot Martin of Pairis also went with these delegates, and while he was there he tried to have his Crusader vow annulled.[138] The pope made it clear that he found it unbelieveable that the Crusaders would have attacked Zara, but he also did not wish to harm the expedition. He gave the delegation a strongly worded letter demanding proper penitence and sworn assurance that papal strictures would be followed in the future. Jean de Friaize, Névelon de Soissons, and Jean de Noyon returned to Zara with the papal instructions.[139] The pope refused to allow Martin to return home from the Crusade without first reaching the Holy Land. So Martin left the delegates and set out for Syria directly.[140] He met Peter Capuano at Benevento and the two of them set sail for Acre from Siponto (Manfredonia), probably arriving in May 1203.[141]

After the agreement was made to aid Alexius, and the reduced delegation returned from Rome with Innocent III's strict instructions, the question became, which of the Crusaders would still be there as part of the army on this expedition when it was time to sail? While the Crusaders were wintering at Zara, Villehardouin refers repeatedly to men who deserted the army and, therefore, in his view, injured the Host. Villehardouin presents his narrative in terms of those who sought to break up the army and disband it versus those who were loyal to the Crusade. In most cases, however, it appears that those who left the army were honestly trying to honor their Crusade vow by fulfilling what they understood to be their obligations.[142] They wanted to go to the aid of the Holy Land and liberate their Christian brethren and the holy places from Muslim control. Villehardouin bitterly condemns their action as plainly disloyal to the Crusade, and he laments that by attempting to sail to Syria on their own, they could do nothing by themselves, whereas by staying together, the army could be successful. At Zara there were many defections. Doubt was raised over the future of this Crusade.

Villehardouin states candidly that because of these defections, "l'armée allait diminuant fortement chaque jour."[143] Five hundred men attempted to flee on a merchant ship but drowned when it sank. Others tried to flee on land but were attacked and forced to return after many were killed. An important German Crusader named Garnier von Borland took passage on a merchant ship and deserted. Even some of the highest nobles arranged to leave. Simon de Montfort, who would later gain fame in the Albigensian Crusade, arranged a safe conduct with the king of Hungary.[144] Then he and his men, including his brother, Guy, and the abbots of Vaux-de-Cernay[145] and Cercanceaux – Robert Mauvoisin,[146] Simon de Neauphle,[147] among others – departed via the long and difficult overland route to Apulia where he hired transport to Syria.[148] Meanwhile Renaud de Montmirail[149] with the support of Count Louis of Blois proposed to go on a mission[150] to Syria in one of the ships of the fleet. He and his men – Hervé du Châtel, Guillaume de Chartres, Geoffroy de Beaumont,[151] Jean and Pierre de Frouville,[152] and others – swore on the Holy Gospels that they would deliver a message from the army, and then within fifteen days, sail to rejoin the Crusade. They never came back.

When the time came for the Crusade to leave Zara in the spring of 1203, part of the fleet set sail and put in to port on the island of Corfu to wait for the rest of the expedition to follow.[153] Before Boniface of Montferrat and Enrico Dandolo set out in the second contingent, Alexius Angelus, the Byzantine prince arrived to travel with them. The Crusaders were all reunited on Corfu, but the presence of Alexius precipitated a crisis that almost destroyed the army. A large number of soldiers, in fact a majority of the French army, including Eudes de Champlitte, Jacques d'Avesnes,[154] Pierre d'Amiens,[155] Guy de Coucy,[156] Ogier de Saint-Chéron,[157] Guy de Chappes,[158] Guillaume d'Aunoi,[159] Pierre Coiseau,[160] Guy and Aimon Pesmes,[161] Guy de Conflans,[162] and Richard and

Eudes de Dampierre,[163] among others, decided they would not continue with the expedition. The leaders who had endorsed Alexius's proposal could not persuade them to continue. The dissident Crusaders removed themselves from the army and encamped in a separate place from which they intended to send word to Walter of Brienne to send ships to take them to Brindisi, which he currently occupied in Apulia. The Crusade leaders along with Alexius and all the high clergy went in desperation to the encampment and literally pleaded on their knees that the soldiers not desert the army. The dissident soldiers agreed to this only on the condition that if they were willing to go to Constantinople, the leaders had to swear on the Holy Gospels that they would only be there a limited time, and that after the treaty with Venice expired (29 September 1203), they would provide ships to take the army to the Holy Land within fifteen days after they were requested. With this solution, the complete disintegration of the Crusade army was narrowly averted. Once again the resolve of the great majority of the soldiers to honor their vow to go to the Holy Land was demonstrated. (Map 3)

No soldier left the army on Corfu, as it turned out, but at Zara before that there were clearly many men who left the army to go directly to Syria. We do not always know what happened to them en route or after they reached the Holy Land. Some went to the Holy Land and then came to Constantinople; some stayed in the Holy Land, fought there, and died there; some came to the Holy Land and then returned home. The continuations to William of Tyre's *History of Outremer* and Ernoul report the arrival of some of these Crusaders in the Latin Kingdom. The results of their activities varied, but each one presented a new challenge for King Aimery II.

The Paris Eracles, among other sources, reports the sailing of Crusaders from Marseilles direct to the Holy Land. Some of these sailings brought soldiers that created difficulties, in particular the arrival of Renaud de Dampierre in Acre in 1202.[164] Renaud had been commissioned to take the place of Count Thibaut III of Champagne, who had died in 1201. Renaud told King Aimery that he wished to break the truce currently in effect and attack the Muslims. The king responded that he should not break the truce but wait for the "hauz homes de France" who were coming from Venice. This made Renaud angry and "si parla moult vilainement au roi en tel maniere que il n'i deust mie parler." Nonetheless "li rois fu sages," and when Renaud saw that he could do nothing in the Latin Kingdom, he and his men decided to go north to help the prince of Antioch fight the king of Armenia. He made it to Jabala north of Margat, where the emir treated them hospitably, but warned them that the emir of Lattakia would not let them pass through his territory without a *laissez passez* from the sultan of Aleppo. Renaud and his men paid no attention, tried to press on, and were ambushed near Lattakia. Most were captured or killed; Renaud himself was taken prisoner and remained in captivity for thirty years![165] Those survivors who made it to Antioch eventually joined John de Nesle who had also come north and ended up fighting with King Levon II *against* the prince of Antioch.[166]

Other ships brought more welcome arrivals to Acre in 1202. During the recruiting period for the Crusade, a large amount of money had been donated to aid the Holy Land. The Paris Eracles and Ernoul report that this treasure, which Fulk of Neuilly had deposited with the Cistercians, was sent "outre mer" and that it could not have arrived at a better time. The Latin Kingdom had just suffered the terrible earthquake of 1202, and the walls of Acre, Tyre, and Beirut were rebuilt with a large part of this money.[167] After these reports, both the Eracles and Ernoul recount a curious story about negotiations between the brother of Saladin and the Venetians. According to this agreement, the Muslims discussed the possibility of the Crusade coming to Egypt with the Venetians and offered them commercial incentives to divert the expedition elsewhere. The gist of this story is to lay blame on the Venetians for secretly obstructing what the Crusaders understood to be their strategy from the time of the treaty of 1201. It marks the beginning of questions voiced about Venetian motives on the Crusade, questions that have had a long history as part of the historiography of the Fourth Crusade. There seems to be no evidence to support this story however, and Queller and Madden comment, "the whole story should be regarded as nothing more than an interesting example of the suspicions and accusations that would naturally arise among the Christians of Palestine cheated of the aid upon which they had counted."[168]

Later, the Paris Eracles and Ernoul briefly return to their narratives of the Crusade. In the Eracles the story picks up in 1202, from the time the army gathers in Venice until it reaches Zara; Ernoul is more complicated but still follows the same main points. We hear about the various defections of Robert of Boves, Simon de Montfort, Renaud de Montmirail, and Jean de Nesle.[169] Resuming developments in the Holy Land in 1203, we also learn about King Aimery's attack on an Egyptian convoy of ships in retaliation for an emir who was engaged in pirating activity along the coast of Sidon, and his foray to the Nile delta to the town of Fuwa, along with other squirmishes. Some of them were quite serious at the time, but neither side wanted to break the truce.[170] Surprisingly, we do not hear about the plague in Acre during the spring and summer of 1203 from the Eracles or from Ernoul, but instead it is described by Gunther of Pairis, and it seems to have been serious during the "dog days" of summer. Gunther includes details on the plague as part of his account of the first visit of abbot Martin of Pairis to Acre from 25 April to 8 November 1203.[171] Meanwhile, other sources describe military actions on the part of the Hospitallers who mounted a number of raids inland toward Hama from Crac des Chevaliers and Margat in 1203 and 1204.[172] However, we are told in the Eracles and by Ernoul that after some of the most prominent recent arrivals, soldiers such as Simon de Montfort; Guy, his brother, who had married the lady of Sidon; Robert of Boves; and others decided to return home in 1204, King Aimery and al-Adil arranged for a new truce.[173]

This truce appears to have been initiated by King Aimery because he feared and expected that the Crusade, which had been diverted to Constantinople, was not going to make it to the Holy Land in the end. The numerous but fragmented contingents of soldiers who had split off from the Crusade and had come east directly had been too small to be of much help; in some cases they had been difficult to deal with and even disruptive. For the most part, after they fulfilled their vow of aiding the Holy Land as they saw fit, if they survived they all seemed determined to return home after their sojourn in the Levant. A few went to Constantinople. Al-Adil for his part feared that the Crusade might in fact still come, and he wanted to put an end to the desultory fighting of recent months. Therefore, he was quite willing to agree to the truce, and the terms were generous. In any case, this truce was scheduled to last for six years, from September 1204 to 1210. Al-Adil would give up Jaffa, the Muslim part of Sidon, and split Ramla and Lydda, so that the Crusaders controlled the former and he, the latter. Arrangements were also simplified for Christian pilgrims who wished to visit the holy places in Jerusalem, Bethlehem, and Nazareth.[174] It was an advantageous treaty for Aimery II, which strengthened his position in the Latin Kingdom, but only briefly, because ultimately the results of the Fourth Crusade seriously weakened the Crusader States in Syria-Palestine. Personally, Aimery did not have long to enjoy his position of greater power and prestige because he died only six months later, on 1 April 1205.

The story of the Fourth Crusade at Constantinople has often been told and need not be recounted here in any detail, except insofar as it sheds light on developments in Crusader Syria-Palestine.[175] Having left Corfu in May 1203, the Crusaders completed their journey in excellent time. En route they met two ships returning from Syria. These ships carried soldiers who had gone to Acre, but finding the city infested with a serious plague, they left to return home, and sighting the Crusader fleet they were ashamed to be identified. One of the refugee soldiers, however, rejoined the main army for the final approach to the Byzantine capital, according to Geoffrey of Villardouin.[176] The Crusader fleet sailed by the walls of the city on St. John's Day, 24 June 1203. When the Crusaders landed and eventually attacked the city, the attack failed, but Alexius III fled for his life even though he did not yield his crown. The blind Isaac II Angelus was placed on the throne nonetheless and forced to accept the terms of the Crusader agreement with Alexius Angelus at Zara. On 1 August 1203, Alexius IV Angelus was crowned co-emperor. The Crusaders then camped across the Golden Horn at Galata, where the new emperor paid them a first installment, enough for them to settle accounts with the Venetians.[177]

At this point the Crusaders had had their first chances to visit the city in any numbers to see its many churches and palaces. Thus they learned about the wealth of the city and its relics. Villehardouin exclaims over, "the marvelous wealth of a city richer than any other since the beginning of time. As for the relics, these were beyond all description; for there were at that time as many in Constantinople as in all the rest of the world."[178] Robert of Clari describes the marvels of the Great Palace complex and other parts of Constantinople in a large narrative section after the fall of the city, but he must have seen these things on earlier visits.[179]

At this point the Crusaders also had their first major disagreement over how to proceed at Constantinople. Alexius IV had requested that the Crusaders remain there beyond the time their treaty expired with the Venetians, to March 1204. There was much discussion and argument. Those who had attempted to leave the Crusade at Corfu demanded their ships so they could go to Syria now. The others argued:

> If we go to Syria now, we shall get there at the beginning of winter, when it is impossible to make war; and so our Lord's work will remain undone. But if we wait till March, we shall leave this Emperor safely established and go away well supplied with money and provisions. Then we can go to Syria, and from there make expeditions into Egypt.[180]

Eventually the Crusaders agreed to stay, some very reluctantly. Alexius IV also arranged with the doge to keep the Venetian fleet in service with the Crusade for the same period of time.

After the disposition of the army was settled, difficulties began to arise. Many Crusaders had accompanied Alexius IV on a campaign to take control of the lands around Constantinople stretching to Adrianople where Alexius III had established a temporary capital. In their absence there was a large anti-Latin riot in the city in which the Greeks attacked and burned the Italian quarters along the Golden Horn. In retaliation, a group of Franks, consisting of Flemings, Pisans, and Venetians, attacked the Mitaton Mosque in the city and set it on fire. The fire spread into a huge conflagration that destroyed a large portion of the city and burned for three days.[181] The fire also poisoned relations between the Latins and the Greeks; the remaining Latin citizens of Constantinople sought refuge with the Crusaders in their camp.

When Alexius IV returned to Constantinople with the army after a campaign of several months, he grew more distant to the Crusaders and he was able to pay them only very little. Even that diminished to nothing although he kept them supplied with food. The Crusaders grew restive; the Byzantine court wanted to see the Latins disposed of. It was December 1203. As Steven Runciman characterized it, Alexius discovered that "an Emperor cannot be as irresponsible as a pretender."[182] As the situation deteriorated, the Crusaders finally delivered an ultimatum for Alexius either to meet his obligations or they would no longer support him. The Greeks were offended by the blunt demands of the Crusaders, and open hostilities broke out between the Greeks and the Latins.

Once the Byzantine court realized that Alexius IV had been cut off from his Latin support, there was a coup d'état in January of 1204. The great-great-grandson of Alexius I Comnenus, Alexius Mourtzouphlus, was crowned Alexius V.[183] He had Alexius IV imprisoned and eventually strangled in February. Isaac II died from natural causes amid the stress of it all. Alexius IV was not a popular ruler, but to the Crusaders he represented the end of all their agreements with the erstwhile Byzantine emperor, Alexius V. They now had only their Crusade vow, and the oath of their leaders to take them to Syria in March. The soldiers in the army mostly saw themselves as genuine Crusaders once more. The leaders of the army and the doge of Venice saw it differently. With the help of the clergy, they argued that the new, immediate object of the Crusade was defined to be Constantinople, and the perfidious Greeks who were schismatics, led by an emperor who was a murderer. Despite the fact that Innocent III had explicitly forbidden any attack on Christians or Christian holdings, a crusading indulgence was approved for members of the army. The clergy preached that an attack on Constantinople was a Crusade against schismatics.[184] The leaders of the Crusade met and worked out how the spoils of victory would be apportioned with cooly conceived calculation. A new treaty was signed among them to this end.

Preparations now went forward for an open assault on the city, and it was only a matter of time before the operation started. On 8 April everything was ready and the attack began.

By 12 April the Crusaders had entered the city by military force, something no other army had succeeded in doing in the history of Constantinople. Alexius V fled with the wife of Alexius III and her daughter, by ship. A new emperor was named, Constantine Lascaris, but he also fled with his brother, Theodore. On the morning of 13 April the Constantinopolitans were ready to acknowledge the victors. A delegation of Greek clergy and the Varangian guard came to greet Boniface of Montferrat and deliver the city into his hands.[185] The Latins were now in control and the horrible result was that the city was sacked with unmitigated greed and violence. Nicetas Choniates, a prominent Byzantine senator, wrote one of the most eloquent laments ever penned concerning the atrocities committed by the Latins in Constantinople;[186] he writes, "O City, that hast drunk at the hand of the Lord the cup of his fury."[187] Even the Paris Eracles matter-of-factly characterizes what the Crusaders did as abandoning the cause of God and embracing that of the devil, destroying and robbing churches and abbeys.[188]

In regard to the gigantic quantity of booty seized by the Crusaders, the Latin and Old French sources provide, for the most part, only brief references that characterize the vast amount, but offer few details. Robert of Clari declares, "not since the world was made, was there ever seen or won so great a treasure or so noble or so rich, not in the time of Alexander nor in the time of Charlemagne nor before or after that."[189] For his part, Geoffroy de Villehardouin here declares that, to his knowledge, "so much booty had never been gained in any city since the creation of the world."[190] An appalling amount of this booty – gold, silver, gems – was religious material plundered from churches and monasteries: liturgical vessels and decorations stripped from holy altars, jeweled covers torn from sacred icons, and conceiveably treasure bindings pried from precious books.[191] There was also terrible destruction of antique artifacts including literally thousands of bronze statues, some melted down weeks later by the Latin emperor to use for coinage.[192] Some of the loot miraculously survived more or less intact and is very famous even today, like the magnificent gilded bronze horses sent to Venice by Enrico Dandolo and placed on the façade of San Marco overlooking the piazza or certain precious objects now in the treasury of San Marco.[193]

But it was the relics and their costly and precious reliquary containers that were the most treasured prizes for many Crusaders.[194] As Jonathan Riley-Smith has written, "the sack of Constantinople was a massive *furtum sacrum*, made against the background of the hysteria that had swept Europe following the loss of the relic of the True Cross of Jerusalem, at the Battle of Hattin in 1187."[195] In arguing that the Crusade was sanctioned by God and had resulted in a partial but substantial victory for Christendom, it was the relics which Western chroniclers cited especially as evidence. True, the Fourth Crusade had not yet recovered Jerusalem; nonetheless, the relics the Crusaders brought back to western Europe from Constantinople were seen as items of divine favor, were to many evidence of the fulfillment of their vow, and were certainly believed to be continuing sources of blessing for the servants of the Lord.[196]

Gunther of Pairis is one of the few main Western sources to refer to the looting of churches that took place. In regard to Abbot Martin of Pairis, Gunther describes how he went to the Church of the Pantokrator where an old Orthodox priest opened the treasury for him. Martin took as many relics as he could carry concealed in his garments and made off. He took these relics back to his ship as quickly as possible and stored them away to protect them, only bringing them out for private prayer and veneration.[197]

One of the sources[198] that actually lists relics taken is the Anonymous of Soissons which identifies the following items acquired by Nevelon, bishop of Soissons, and shipped back to France.[199] He brought many relics destined for a number of churches:

For the Cathedral Church of the Blessed Mary and the holy martyrs Gervais et Protais at Soissons:

> The head of the most blessed Protomartyr Stephen;
> The finger of the blessed Apostle Thomas which he placed in the side of the Lord;
> The crown of the head of the blessed Mark, the Evangelist;
> One thorn from the Crown of the Lord;
> A large part of the stately robe of the Blessed Virgin Mary;
> A portion of the towel with which the Lord girded himself at the Last Supper.[200]
> The head of the blessed John the Baptist;
> The head of the blessed Apostle Thomas;
> The crown of the head of the blessed Blaise with one of his ribs;
> Two large crucifixes made from the wood of the Lord;
> The staff of Moses;
> A part of the reed with which the Lord was beaten, and many other relics.[201]

For the Abbey of Notre-Dame de Soissons:

> The belt of the Blessed Mary.[202]
> The head of the blessed Apostle Thaddeus; one crucifix made from the wood of the Lord.[203]

For the Abbey of St. Jean des Vignes:

> The forearm of that same John the Baptist.[204]
> The head of the blessed martyr James.[205]

For the Cistercian monastery of Longpont:

> The head of the blessed Dionysius the Areopagite, with one crucifix made from the wood of the Lord.[206]

Some of these relics were said to have come from "Maquerel," identified as Mount Machaerus near the Dead Sea in the Holy Land. According to tradition, the relics of St. John the Baptist had been taken from this place of his martyrdom in the Holy Land, to Alexandria, and then to Constantinople.[207]

For our considerations here, it is very important to distinguish this flood of relics that came to the West from Constantinople, wherever their original source may have been, and those relics which may have come directly from the Latin Kingdom at this time. As we shall see, many relics and reliquaries from Constantinople began to appear in western Europe following the Crusader conquest of the city in 1204. Few appear to have come from the Holy Land recently and directly.

When the clamor died down after three days, on 15 April, order was restored and the Crusaders were faced with the problems of dividing the spoils, nominating a ruler, and determining their agenda for the future. Would the Crusade continue? How would Constantinople and its surrounding lands be administered? How would papal approval of this conquest be obtained? In May six electors were chosen by the army and six by the Venetians. The six Frankish delegates were all clergy: Bishop Nevelon of Soissons, Bishop Conrad of Halberstadt, Bishop Peter of Bethlehem, Bishop John of Acre, Bishop Garnier of Troyes, and Abbot Peter of Locedio. The six Venetian delegates were chosen by a committee. Every effort was made to ensure the impartiality of the electors. Bishop Nevelon of Soissons announced their choice at midnight on 9 May 1204; it was Count Baldwin of Flanders. He was crowned in the Cathedral Church of Haghia Sophia on 16 May 1204. Boniface of Montferrat became king of Thessalonica, where his brother, Nerio, had reigned before. Shortly after the coronation of Baldwin, the Venetians had taken over Haghia Sophia and installed canons who elected Tommaso Morosini the first Latin patriarch of Constantinople, pending papal approval.[208]

For the new Latin emperor, Baldwin, and the men he invested with land, offices, and fiefs and made knights in his service, for Boniface and his men, for the Venetians, the Crusade was over. In the months following his coronation, Baldwin sought to move ahead with the task of organizing the new empire. Baldwin wrote to the pope exclaiming what a glorious victory the Crusaders had won;[209] he also wrote requesting that the pope send members of the major orders, that is, Cistercians, Cluniacs, canons regular, among others, and that service and prayer books be provided: missals, breviaries, and gospels for the Latin liturgy.[210] He even asked the pope to urge masters and students of the University of Paris to go to Constantinople "to reform the study of literature."[211] Pope Innocent III for his part was concerned that the union of churches be accomplished, that order be established in the new Latin Empire, and that the Crusade be continued.[212] Clearly Innocent III intended that the Crusade go on to the Holy Land; the fact that he employed bishops from sees in the Latin Kingdom to be legates and pro-legates (e.g., Soffredus patriarch of Jerusalem, John bishop of Acre, Peter bishop of Bethlehem, among others) clearly indicates his expectations in this regard. But despite the ideas and will of the pope, this Crusade was, in effect, over. A few Crusaders subsequently set out for Syria, but the vast majority stayed in Constantinople. Some may have conveniently forgotten their original vow to go to the Holy Land, but most probably were able to convince themselves, aided by the preaching of certain members of the clergy, that they would complete their vow by remaining to protect the new empire until the spring of 1205.[213]

Among those Crusaders who did not stay in Constantinople but went on to the Holy Land to fulfill their vow, there were a number of prelates. One was Abbot Martin of Pairis. In fact he sailed in late summer 1204 directly to Acre, where he arrived on 1 October.[214] He arrived some weeks after Marie, the wife of Count Baldwin of Flanders, had died in Acre on 9 August 1204.[215] Marie had sailed from Marseilles directly to Acre, suggesting that she expected her husband to join her there on the Crusade, but she was cruelly disappointed. Before she could rejoin him in Constantinople where he had been recently crowned emperor, she became ill and died. Abbot Martin by contrast maintained good health, and in fact he seemed to travel with his precious cargo of relics under the special safe passage of exceptional good fortune.

While Martin was in Acre he revealed his sacred treasures only to one trusted person, Werner of Egisheim. Werner was amazed at the relics and feared greatly for their safety and that of Martin should he attempt to return home to Pairis with them. He proposed that Martin stay in the Latin Kingdom and take a position presiding over a monastery of the new Carmelite order, or, if he preferred, his own order, the Cistercians, which would also allow him to honor the Holy Land with these precious objects. Martin declined, and apparently sought additional relics while he was in Acre. In any case he sailed on 31 March 1205 in the same convoy as Bishop Conrad of Halberstadt.[216] They arrived in Venice on 28 May 1205. From Venice Martin went unmolested with all his treasures over the Alps to Basel where he began his journey, and then to his home monastery in Pairis, on 24 June 1205.

Gunther is at pains to inform us about these holy relics that Martin had so lovingly brought from the East, and he provides us with a list, which is of great interest.[217]

> In order to encourage a firmer belief in them in our readers, we have decided to list them by name. . . . a trace of the Blood of our Lord Jesus Christ. . . .
> . . . wood from our Lord's cross. . . .
> . . . a not inconsiderable piece of St. John, forerunner of the Lord.
> . . . the arm of St. James the Apostle.

There are also relics of other saints, whose names follow:

> Christopher, martyr
> George, martyr
> Theodore, martyr
> Item: the foot of St. Cosmas, martyr
> Item: a relic from the head of Cyprian, martyr
> Item: a relic of Pantaleon, martyr
> Item: a tooth of St. Lawrence
> Item: a relic of Demetrius, martyr
> Item: a relic of Stephan, protomartyr
> Item: relics of Vincentius, Adjustus, and of Mauritius, and his companions
> Item: relics of Crisantius and Darius, martyrs
> Item: relics of Gervasius and Protasius, martyrs
> Item: relics of Primus, martyr
> Item: relics of Sergius and Bacchus, martyrs
> Item: a relic of Protus, martyr
> Item: relics of John and Paul, martyrs
> Item: a relic from the place of the Lord's Nativity
> Item: a relic from the area of Calvary
> Item: a relic from the Lord's Sepulcher
> Item: a relic from the stone rolled away
> Item: a relic from the spot of the Lord's Ascension
> Item: a relic from the stone where John stood when he baptized the Lord
> Item: a relic from the spot where Christ raised Lazarus
> Item: a relic from the stone on which Christ was presented in the temple
> Item: a relic from the stone on which Jacob slept
> Item: a relic from the stone where Christ fasted
> Item: a relic from the stone where Christ prayed
> Item: a relic from the table on which Christ ate the Supper
> Item: a relic from the place where He was taken captive
> Item: a relic from the spot where the Lord's mother departed from her sepulcher
> Item: a relic from the sepulcher of the apostle Saint Peter
> Item: relics of the holy apostles Andrew and Philip
> Item: a relic from the place where the Lord gave Moses the law
> Item: relics of the holy patriarchs Abraham, Isaac, and Jacob

Item: a relic of St. Nicholas, bishop
Item: a relic of Adelasius, bishop
Item: a relic of Agricius, bishop
Item: a relic of John Chrysostom
Item: a relic of John the Almsgiver
Item: a relic of the milk of the Lord's mother
Item: a relic of Margaret, virgin
Item: a relic of Perpetua, virgin
Item: a relic of Agatha, virgin
Item: a relic of Agnes, virgin
Item: a relic of Lucy, virgin
Item: a relic of Cecilia, virgin
Item: a relic of Adelgunde, virgin
Item: a relic of Euphemia, virgin.[218]

This list contains an amazing array of relics that are grouped in interesting ways. There are obviously the special important relics in the first group including relics of the True Cross, the early medieval relics in the second group, a group of relics related mostly to the sites of Christ's activities in the Holy Land, and a group of relics of holy bishops, martyrs, and virgins. It is unclear why Gunther refers to the relics of some saints using the title of "saint" and some he refers to only by their name. Perhaps this is based on the tituli that these relics carried, which he is recording as he found them. But it is striking to find in the midst of this list, a series of relics – all from the Holy Land – that are pieces of stone or wood from the locations of sacred events in the life of Christ. These are the kind of relics pilgrims to Jerusalem, Bethlehem, and Nazareth collected from Early Christian times on. Their grouping here led one eminent nineteenth-century scholar to suggest that Abbot Martin may have gotten them from Syria-Palestine instead of Constantinople.[219] I think it is indeed likely that Martin collected them from the holy places during one of his visits to Acre, both of which lasted about six months. Perhaps it was more probable during the second visit when he was so focused on his collection of relics. The fact that Gunther says nothing about the acquisition of relics in Acre apparently indicates that Martin did not make notes of all his activities.

This list, and especially the group of relics from the Holy Land, points up a perplexing problem that now becomes a factor all through the period, 1204–61. When relics come from the East, their origin is often assumed to be from Constantinople when in fact they may have come from the Holy Land.[220] The origin of the relics is one thing: many came from the Holy Land or from Rome or even from Constantinople; the location of the relics in the years around 1204 is another: for example, a relic from the Holy Land could have been in Constantinople for years, but another relic from the Holy Land could have been newly acquired in the Holy Land in 1204 or 1205. Either relic could then have been taken later to a church or monastery somewhere in western Europe. It is not always clear in these lists of relics said to be from Constantinople where and when the relics came from originally. We shall have to be vigilant about this issue when assessing the origins of relics, identifying where and when pilgrims could have acquired them in the East and where and when they may have been placed in reliquary containers.

It seems likely that many, indeed most, precious relics related to Christ, the Virgin, or the saints taken to the West from the Holy Land were carried in metal reliquary containers. Certainly this is the indication we have with regard to the relics of the True Cross sent to Europe from Jerusalem in the twelfth century, and we may imagine that such was the case for most such relics taken West from Constantinople in 1204 as well. For rather more modest relics, however, such as those pieces of stone, wood, or even soil included in the list of Martin of Pairis cited here, we may well wonder about the nature of the containers into which they were placed.

We know that early Christian pilgrims carried items of this sort in boxes, like the famous wooden container with the painted lid in the collection of the Sancta Sanctorum in Rome.[221] Besides such boxes, Durand and Gauthier also mention the possibilites that relics and precious souvenirs were placed in small leather or silk purses or in carved ivory oliphants, an example of which is the ensemble of relics of the patriarchs Abraham, Isaac, and Jacob, and of Sarah, which in 1255 was in the Cathedral of Angers and is now in the museum there.[222] These oliphants are usually attributed to S. Italy or Sicily and probably do not come from the Holy Land, but there are a number of objects of Fatimid Islamic origin – coffrets of ivory or gold and ampoules of rock crystal – that are found in church treasuries in western Europe and which may have served in such a capacity.[223] This whole matter needs more study, but in fact there may well be as much or even more of this kind of use in the thirteenth century as there was in the twelfth.

It is obvious, of course, that because of the conquest of Constantinople many thousands of relics were acquired there by the Frankish Crusaders and by the Venetians and were brought back or sent back to western Europe.[224] We know of a number of relics of the True Cross, among others, for example, some of which we have already encountered in the evidence concerning Bishop Nevelon of Soissons[225] and Abbot Martin of Pairis.[226]

Other such relics are known as well; for example, Conrad of Krosigk, Bishop of Halberstadt, brought back a relic of the True Cross in a handsome reliquary from Constantinople, along with other "dominical" relics, that is, relics of Christ.[227] Conrad of Halberstadt sailed from Constantinople to the Holy Land shortly after Martin of Pairis, arriving in Tyre on 7 October 1204.[228] From there he continued on to Acre where Soffredus and Peter Capuano, among others, were about to leave for Constantinople.

In contrast to Martin of Pairis, Conrad of Halberstadt actively engaged himself in the affairs of the Latin Kingdom. A number of prelates delegated him to perform duties on their behalf: Soffredus, Peter Capuano and Clerembaut, archbishop of Tyre, all set out for Constantinople shortly after Conrad's arrival. Conrad was deputed to care for the Cathedral of Tyre, and while he lived in the archbishop's palace there, he directed work on the rebuilding of the fortifications of the city – walls still needing repair after the 1202 earthquake – dispensed alms to the needy in the city, and even consecrated the new bishop of Sidon, Terricus.[229] So valuable was his service said to have been that when he prepared to board his ship for home, "Lord Amalric [Aimery II], king of Jerusalem, as well as Knights of the Temple and of the Hospital, and citizens of both Tyre and Acre, along with all the clergy and laity, attended him with sorrow, declaring with truth that indisputably their whole land was left desolate by the single absence of him whose presence, they asserted without doubt, had happily been a blessing for the Holy Land."[230]

While he resided in the Holy Land, Conrad is reported to have had a number of life-changing experiences. At one point during his travels, Conrad came down with a serious illness, and accordingly he visited the shrine of the Virgin in the Church of Notre Dame in Tortosa. This shrine was said to have been constructed by St. Peter in honor of the Virgin, and as a pilgrimage site, it had become famous for its miraculous cures. When Conrad was cured, he attributed his healing to the efficacy of divine intervention resulting from the response to his prayers at this place.[231] Even more amazing was the fact that Conrad had taken the vow of a Crusader and had participated in the entire Fourth Crusade, from the time he took the Cross on 7 April 1202 to the winter of 1204–5 in the Holy Land, in a state of excommunication. He had been excommunicated in February or March of 1202, shortly after his consecration as bishop, because of his open support for the Hohenstaufen, Philip of Swabia, in defiance of Pope Innocent's support of Otto of Brunswick.[232] In Acre, before the two papal legates left for Constantinople, Conrad prevailed on them to pardon him, releasing him from the sentence of excommunication on the understanding that he would be required to visit Rome on his return journey and secure papal confirmation. Finally, while in the Holy Land Conrad was also reported to have had an experience that resulted in his decision to enter the Cistercian order.[233] Suffice it to say that Conrad was pardoned by the pope in 1205, and in 1208 he entered the Cistercian order at Sittichenbach.

Given his importance and high-profile activity, it is notable that Conrad returned to Halberstadt on 16 August 1205 with a number of relics acquired during his travels on the Fourth Crusade and in the Holy Land.[234] The list recorded by the *Gesta Episcoporum Halberstadensium* contains an impressive number of dominical relics, including not only precious fragments of the True Cross, but also the Holy Sepulcher, the Crown of Thorns, a trace of the Holy Blood, pieces of the Holy Shroud, and the Sudarium, among others associated directly with the Passion and death of Jesus.[235] The nature and importance of these dominical relics are comparable to those acquired later in the thirteenth century by King Louis IX for the Sainte Chapelle, and for the most part they are significantly different from the most important group acquired by Martin of Pairis and placed at the beginning of his list. In particular, however, there is no group of relics in Conrad's list comparable to the set of relics collected from holy sites noted in Martin's list. None of the relics collected by Conrad necessarily suggests that he acquired some of them while living in the Holy Land, although we cannot absolutely rule out this possibility. But the contrast of types of relics in the two lists seems to lend additional credence to the likelihood that Martin of Pairis obtained some of his relics directly from the Holy Land, perhaps acquired in Acre, if not necessarily directly from each holy site indicated, that is, places in and around Jerusalem.

As we have seen, other important relics are mentioned besides those of the True Cross in these lists and in the chronicler's accounts. The argument has been offered that the Holy Shroud, what Robert of Clari calls the "sydoine,"[236] was taken to the West at this time.[237] In discussing the marvels of the city, Robert of Clari described a long series of relics in the Great Palace. There in the chapel of the Blessed Virgin of the Pharos, he saw important dominical relics besides two large pieces of the Holy Cross, such as part of the Holy Lance, two Holy Nails, a vial of the Holy Blood, the seamless Robe of Christ, and the Crown of Thorns.[238] There were also other major relics such as the robe of the Virgin Mary and the head of St. John the Baptist in this same chapel.

Besides these precious relics, Geoffrey of Villehardouin and Robert of Clari, among other sources, also discuss the capture of an important Byzantine icon, which provides some significant evidence of how this icon, and icons more generally, were viewed by the Crusaders.[239] During the siege of Constantinople in the winter of 1204, just as Alexius V Mourtzouphlus took the throne, Henry of Flanders led a troop of Crusaders northwest of the city to Philia on the Black Sea. The object of this raid was to provision and "pay themselves" some of what the rulers of Byzantium had now refused to pay. While Henry and his men were on the way back from this successful raid, Mourtzouphlus ambushed him. The Crusaders fought off the attack, and when Mourtzouphlus retreated with his bodyguard, "They were in such haste, he and those of his company, that they let fall the icon [ansconne] and his imperial helmet and the standard and the icon, which was all of gold and charged with precious stones and was so beautiful and so rich that never was one seen to equal it. When the French saw this, they left off their pursuit."[240] Thus Mourtzouphlus escaped, but lost his imperial standard, his helmet, and this holy icon. Villehardouin says, "It was one in which he and the other Greeks placed great faith, because it bore the picture of Our Lady."[241] Nicetas Choniates tersely comments, "the icon of the Mother of God, which the Roman emperors reckon as their fellow general, was taken by the enemy."[242] This is apparently a holy icon of the Hodegetria, a palladium of the city of Constantinople, which Alexius V has surrendered here.[243] Robert of Clari continues:

> When they came near the camp, the bishops and the clerks who were in the camp came out in procession to meet them and they received the icon with great joy and rejoicing, and it was entrusted to the bishop [Garnier] of Troyes. So, the bishop carried it into the camp, to a church to which they all repaired, and the bishops chanted a service, and they made great rejoicing over it. And from the very day on which it was captured, the barons all decreed that it should be given to Cîteaux, and later it was taken there.[244]

This is one of the most informative stories about icons in the chronicles of the Fourth Crusade. It demonstrates with what reverence the Crusaders held such a holy image. It describes the icon as encased in gold with jewels, which means that it had been given a riza, which gave the icon the appearance of a reliquary, of which the image itself was the relic.

Therefore the Crusaders were impressed with the icon as a holy image, as a precious object, and as a quasi-relic. It is not surprising that this holy object was put in the hands of a bishop, but we may wonder what service they chanted with it. The claim voiced here and in other sources that the icon was taken to Cîteaux has no known basis in fact, but it does underline the extraordinary importance of the role which the Cistercians played in this Crusade.

Before 1204, Crusaders and others pilgrims had heard of the wealth of Constantinople, but most had never seen it. Now these Crusaders not only could see such splendid and lavishly appointed Byzantine churches, such extraordinary relics in such sumptuous reliquaries, or such beautiful icons so lavishly decorated, they could now possess them, or parts of them, as their own. For many of these Crusaders, Jerusalem and the Holy Land were forgotten, and they had been replaced by the glittering reality of Constantinople, its wealth, and the opulence of its religious holdings.

THE IMPACT OF THE FOURTH CRUSADE ON THE LATIN KINGDOM AND THE CRUSADER STATES IN THE LEVANT

The coronation of the new Latin Emperor of Constantinople on 16 May 1204 was a major event in which the new ruler assumed the splendid regalia of the Byzantine emperors.[245] Baldwin IX of Flanders became Emperor Baldwin I with the blessing of the Frankish and the Venetian electors. The Latin Empire thereby came into being as the newest "Crusader State" in the Levant, along with the Crusader States on mainland Syria-Palestine and the Kingdom of Cyprus. Ambitious men saw the Latin Empire as filled with the potential for gaining land and new fiefs in the specific territories – the Kingdom of Thessalonika, the Lordship of Athens, and the Principality of Achaia – that were rapidly set up after 1204 in what became known as Romania or Frankish Greece. Overall, the Latin Empire and Frankish Greece were political entities that were comparatively attractive to many Crusaders for a variety of reasons.[246]

Following the coronation, Baldwin I began the task of establishing the Latin Empire. The division of the city and rights to the spoils were administered according to the pact agreed on between the Venetians and the Franks before the conquest.[247] The Venetians received three-eighths of the city including Haghia Sophia and three-eighths of the empire. Baldwin as emperor ruled the rest of the city, and a quarter of the empire including Thrace, certain Aegean islands, and some land to the south. Boniface of Montferrat eventually received the kingdom of Thessalonica after he sold Crete to the Venetians. These arrangements then formed the basis for a new partition treaty which was signed in October 1204.[248] Basically the western part of the Byzantine empire was to be divided among the Latin conquerers of Constantinople in the same proportions as before, one-quarter to the emperor, three-eighths to the Venetians, and three-eighths to the other Crusaders, but with adjustments in regard to the specific territories involved. Many of the provinces were still unconquered, and some would never be captured; the Venetians took more than they could control with their maritime power, but they focused their attention on Crete and the ports of Modon and Croton. After the pact was signed, Baldwin assembled his court and granted fiefs to hundreds of vassals.

For a fleeting moment, the prospect of Crusader and Venetian control of Constantinople and the Byzantine Empire offered a shining hope for the Crusaders in the Holy Land. Without the obstruction of the Byzantine emperor and the xenophobic resistance on the part of the Greek populace to Crusaders en route to Syria-Palestine, with the empire as an ally and source of economic and logistical support, manpower and resources would be close at hand to come to the aid of the Holy Land; the Latin Kingdom would theoretically be strengthened.[249] Both Crusader and Muslim chroniclers saw this possibility. But the reality was to be quite different. From the very first, the Latin Empire diverted Christian men and wealth away from the Crusader States in Syria-Palestine. In some cases men already in Syria were drawn to the Latin Empire.

Among the Franks who had come to Baldwin's coronation in May had been "many knights from Outremer."[250] This could mean knights from the West or from the Latin Kingdom. Villehardouin names several of the Crusaders who came from Syria to settle in the Latin Empire. There was Stephen of Perche[251] and Renaud de Montmirail,[252] who had left the army and sailed to Syria first when the Fourth Crusade got underway, and only now came to Constantinople. With them were Hugh of Tabarie; Raoul, his brother; Thierry of Tenremonde, "et grant plenté de la gent del pais, de chevaliers, de Turchoples, et de serjanz." Finally, he mentions also his nephew of the same name, Geoffrey de Villehardouin,[253] who came from Syria to Modon.[254] Stephen of Perche became the duke of Philadelphia in Asia Minor and Geoffrey of Villehardouin eventually established himself in the Morea as the prince of Achaia. Slightly later, the Paris Eracles and Ernoul both claim that Baldwin sent a call out to the Latin Kingdom in early 1205 for men at arms, and that a hundred knights went along with ten thousand others.[255] These are obviously inflated numbers and although the actual number of knights and other soldiers was probably not tremendously large, the fact was that the Latin Empire and Frankish Greece now joined the kingdom of Cyprus in luring men away from the Crusader States in Syria-Palestine, the latter which were always strapped for manpower. Runciman observes, "after the conquest of Romania recruits for the military orders were almost the only knights to come out from Europe to defend the Holy Land."[256] And the lure of Constantinople was not only confined to soldiers.

When the patriarchal see of Jerusalem had become vacant with the death of patriarch Aimery in 1202, a papal legate to the Fourth Crusade, Cardinal Soffredus was eventually named to replace him, sometime before May of 1203.[257] By this time, however, it was becoming apparent that the Fourth Crusade was not going directly to the Holy Land, but rather would go first to Constantinople. In this situation, Soffredus, thinking more of his office of cardinal, sought permission of Innocent III to resign his see. Already having turned aside numerous other Crusader requests to have their vows dismissed, the pope attempted to persuade Soffredus to honor his appointment. Not only did he fail, but also when Constantinople fell in April of 1204, both Soffredus and Cardinal Peter Capuano, the other legate, eventually left Acre and went to Byzantium to be part of the new Latin Empire. Thus the patriarchal see of Jerusalem was left vacant until Innocent III managed to appoint Albert of Vercelli, who took office in December of 1205.

Soffredus was not the only prelate from the Latin Kingdom to absent himself at this time. Peter, bishop of Bethlehem, who apparently had been living in the West, and the new bishop of Acre, John II, went to Constantinople with the army and stayed there, serving as electors for the new emperor.[258] Both were killed at the battle of Adrianople in 1205, and therefore John could never return to his diocese.[259] Not only, therefore, did the new Latin Empire draw ecclesiastics away from Crusader Syria-Palestine, but also episcopal sees were left unfilled for many years in the early thirteenth century. In contrast to the enlarging and developing hierarchy of the Latin patriarchate in Constantinople, the sees of Acre, Bethlehem, Lydda, Nazareth, and Tiberias had no incumbents until 1208, 1218, 1210, 1223, and 1241, respectively.[260] In the wake of the Fourth Crusade and the new ecclesiastical requirements of the fledgling Latin Empire, clearly the hierarchy of the Latin Kingdom was being neglected.

Furthermore, the European vision of the Holy Land was being intercepted and diverted as well by the fabled wealth of Constantinople. Whereas before 1204, and especially before 1187, the Latin Kingdom had been the source of important dominical relics of the passion and death of Christ, foremost among which was the relic of the True Cross,[261] after 1204 Constantinople became the highly visible source of such relics for several decades. The Latin Emperor himself, in his quest to attract support to the weak and financially strapped Latin empire, sent a stream of major relics westward.[262] Starting with a large and important bequest to King Philippe Augustus from Emperor Baldwin I in September of 1205, which included a relic of the True Cross,[263] we also note relics sent by Baldwin I's successor, Emperor Henry I, in 1206 and 1208.[264] These examples were all gifts, but the most famous consignments in 1239 and 1241 were acquired by Louis IX, who paid a significant amount of money to secure a remarkably full set of relics of the Passion for the Sainte Chapelle in Paris.[265] Besides these relics from the Latin Emperor, many others, clergy or laymen, sent or brought relics of the True Cross, among many others, home between 1205 and the 1210s.[266] After 1204 Constantinople in a sense eclipsed the Holy Land and Jerusalem as a source of religious "wealth" for the simple reason that Constantinople was in Frankish hands and Jerusalem was not.

In sum, the Fourth Crusade was a tremendous disaster for the Crusaders in the Holy Land, as well as for the Byzantine Empire. The Fourth Crusade not only did not bring aid to Jerusalem and the Holy Land, but it also diverted men and resources away, it lessened the presence of and the focus on the Holy City in the consciousness of western Europe, and it weakened Frankish defenses against the Muslims in the Levant. If the Fourth Crusade had been able to conquer all of the remains of the Byzantine Empire in 1204–5, the Latin Empire might have provided major support to the cause of the Crusaders in the Holy Land. As it happened, the Fourth Crusade could not conquer but a portion of the former Byzantine imperial territory, some of which Greeks ousted from Constantinople controlled in the form of the empire of Nicaea to the east and the despotate of Epirus to the west, and some of which was still controlled by the Seljuk Turks in Asia Minor or by the Bulgars north of Romania. The land route from Europe to the Holy Land therefore became even more dangerous and difficult, and the result was that no Crusade in the future would even attempt to march in the footsteps of their First Crusade ancestors.

Meanwhile, within the bosom of Christendom the effects of the Fourth Crusade were even more catastrophic. Far from unifying the Greek and Latin churches, the taking of Constantinople effectively eliminated this possibility, one which has remained unattained to this day. The sack of the city and the barbarity of the Crusaders as conquerors would never be forgotten by the Byzantines. Orthodox and Latin Christians viewed each other with suspicion and sometimes hatred that not even their common Muslim enemy could always dispel.

THE LATIN KINGDOM OF JERUSALEM FROM THE END OF THE FOURTH CRUSADE TO 1210

In a certain sense, the Fourth Crusade ended a sustained effort to regain the Holy Land and Jerusalem that had been initiated in response to the conquests of Saladin in 1187–8. King Aimery II had hoped for significant reinforcement from the Fourth Crusade. When that failed to materialize, he was able to protect the Crusader States from errant Crusaders who came to fulfill their individual vows but threatened to disrupt the status quo in mainland Syria-Palestine in terms of the existing truces with the Ayyubids. When it was clear that the Fourth Crusade would not move beyond Constantinople, Aimery and al-Adil agreed on a six-year truce, from September 1204 to July 1210. It is not certain who wanted the truce more or for what reasons: Aimery, to guard and preserve Crusader lands now that military reinforcements would not be arriving anytime soon, or al-Adil, who could imagine that the Frankish conquest of Constantinople would result in the strengthening of Crusader power as the Muslims had seen it happen in the twelfth century when the Byzantines were allied with King Amalric I.[267] Whoever initiated the truce, the fact is that the terms were very favorable for the Crusaders: recall that Beirut, Sidon, Jaffa, and Ramla were returned to the Crusaders along with access to Nazareth. Unfortunately Aimery II was not able to enjoy the benefits of this diplomatic achievement for long. A few months later, on 1 April 1205, he died at Acre after a short illness.[268]

Once again the Latin Kingdom was forced to deal with the loss of its ruler. It was clear that with the death of Aimery II, the crown of Cyprus would pass to Hugh, his son by Eschiva of Ibelin, who became Hugh I and reigned from 1205 to 1218.[269] Hugh was only nine years old at this point and a regent had to be named, Walter of Montbéliard, an ambitious newcomer to the Latin East only two or three years previously.[270] Furthermore, the kingdoms of Cyprus and Jerusalem had separate institutions and separate systems for electing their own rulers. Hugh had no claim on the throne of Jerusalem, and in any case, Queen Isabel, now the most widowed royal woman ever in the Latin East, was still alive, albeit briefly. She survived Aimery apparently only for a few weeks and then John of Ibelin, lord of Beirut, her half brother and the acknowledged leader of the nobility in outremer, was elected regent for the new queen. Maria of Montferrat, eldest daughter of Isabel and Conrad of Montferrat and niece of John of Ibelin, was the designated heiress, but she was only thirteen at the time. Fortunately the truce arranged by Aimery II held, and John of Ibelin ruled for three years in comparative peace and tranquility.

In 1208 as Maria reached her seventeenth birthday, envoys were sent westward to find her a husband who could become the new king. With the help of King Philippe Augustus, another knight from Champagne was identified, John of Brienne. Despite his relative obscurity, compared with Count Thibaut who had been chosen to lead the Fourth Crusade or Count Henry who ruled the Latin Kingdom from 1192–7, and his position of genteel poverty, John of Brienne was knowledgeable and experienced, and although he was probably about thirty-five, not sixty years old as he has usually been regarded, he proved to be durable and quite sensible.[271] John of Brienne finally arrived at Acre on 13 September 1210. The new patriarch of Jerusalem, Albert, presided at his wedding to Maria on 14 September, the Feast of the Exaltation of the Holy Cross. The royal couple were crowned at Tyre on 3 October in the presence of major clergy and knights of the realm.[272] Present were the patriarch of Jerusalem, Albert; Clerembaut, archbishop of Tyre; Peter of Limoges, bishop of Caesarea; Robert, archbishop of Nazareth; Walter of Florence, bishop of Acre; Raoul of Merencort, bishop of Sidon; William of Chartres, master of the Temple; Garin de Mont Agu, master of the Hospital of St. John; Hermann, master of the German Hospital; John d'Ibelin, Balian of Sidon; Raoul of Tabarie; and Guy de Montfort, among others of lesser importance.[273] Once again such coronation ceremonies were staged in rather grand style.

Despite the relatively peaceable period between 1205 and 1210, there were certain Muslim incursions, and open hostilities flared continuously in the north over the seemingly intractable problem of the Antiochene succession. Furthermore, the Latin Kingdom was vulnerable given how narrowly its territory was situated along the coast. The fact was that even though the Crusaders controlled Jaffa, the road north beyond Arsuf past Caesarea to Acre was undefended and dangerous for travel because it was open to raids. North of Acre and Tyre, the kingdom extended little beyond Beirut, and Sidon, located between the latter two cities, was depopulated. The Latin Kingdom therefore, could hardly be said to be in a strong position. Serious attention had to be given to the defense of the realm. Refortification was an important activity when the men and the wherewithal were available. More resources were needed but were not available from other states in the Frankish East. The new Latin Emperor, Henry I (1206–16), was fully occupied in attempting to establish the power and prestige of the fledgling Latin Empire; the Kingdom of Cyprus saw the fall of the ambitious regent, Walter of Montbéliard, when King Hugh I came into his majority in 1210.[274] For the Latin Kingdom, a new Crusade seemed to be required, but it would be many years in coming.

Compared with the Latin Kingdom, however, the situation in Antioch was volatile and unstable.[275] After considerable fighting, Bohemond IV had been able to return to Antioch in 1206. Before that he had endeavored to turn the conquest of Constantinople to his own benefit. To strengthen his claim as ruler of Antioch in opposition to that of Raymond Roupen as supported by King Levon of Armenia, in 1204 Bohemond did homage for Antioch to Mary, wife of the new Latin Emperor, Baldwin, while she was in Acre. The idea was to recognize Bohemond's dynasty as the legitimate heirs of the Latin Empire's Byzantine predecessors.

Bohemond's ambitions to rule Antioch, his rabid opposition to Raymond Roupen and his Armenian supporters, and his long-standing antipathy to the Latin patriarch of Antioch, Peter of Angoulême, also eventually inspired Bohemond to place a Greek prelate on the patriarchal throne of Antioch, Symeon II, in 1207. A year later, in 1208, Bohemond even made an alliance with the Greek emperor of Nicaea, Theodore Lascaris. These anti-Armenian/pro-Greek Orthodox measures brought Bohemond in direct conflict with Pope Innocent III and with Peter of Angoulême. Bohemond reacted to the situation by imprisoning the patriarch in Antioch, who promptly died of thirst from his brutal treatment.[276] Innocent III could not move militarily against Bohemond, who was defending the Crusader States from the infidel, so he had Bohemond excommunicated by Albert, patriarch of Jerusalem, later in 1208, until Bohemond would make satisfaction for this murder. Bohemond would not have the sentence of excommunication lifted from his shoulders until 1232. In fact, as Hamilton points out, the situation in Antioch was indeed strange. At a certain point in this period, the pope, and the Latin patriarch of Antioch, had watched "not only the unedifying spectacle of a Frankish prince fighting against an Armenian king in communion with the holy see, while allied with a son of Saladin, but also the development of a schism between the Latins and the Orthodox in the patriarchate of Antioch which was never subsequently healed."[277]

In an effort to regain some control of the situation, the pope moved to appoint a new Latin patriarch, a new departure in the principality of Antioch from customary practice in the twelfth century. The pope himself gave Peter of Ivrea, a Cistercian, the pallium and Peter then traveled to the East, arriving in Antioch in October 1209.[278] As he assumed his new position he was given possession of the patriarchal treasury, which the Hospitallers had been guarding.[279] Fortunately when Peter arrived in late 1209, the pope was beginning to temper his support of the Armenian cause. Bohemond meanwhile obviously saw it was to his advantage to be on good terms with the new patriarch, so despite the fact that the war over the succession continued, he and Peter managed to cooperate. Nonetheless, developments in Antioch took an even stranger turn than before. One of the reasons for the pope's changing position vis-à-vis the interests of Cilician Armenia was pressure being put on him by the Templars to regain their castle of Baghras,[280] northeast of Antioch, from King Levon II. When Innocent III ordered Patriarch Peter to attempt to negotiate a settlement, Levon II refused to return Baghras and confiscated all Templar property in his kingdom. The pope surprisingly excommunicated Levon II, and, to protect his patriarch, he requested the emir of Aleppo, az-Zahir, a son of Saladin, to guard him against Armenian attack. Bohemond had established an alliance with az-Zahir earlier, but this was the first time that a pope negotiated directly with a Muslim prince in the Crusader East. There would be much more diplomatic interaction between the Crusaders and their Muslim adversaries in the thirteenth century.

In 1213 Levon II returned the Templar property he had seized, and his excommunication sentence was removed. But he did not return Baghras on the border, so that irritant still remained. At the end of the year, the young prince Raymond, at age eighteen Bohemond's son and heir to the rule of Antioch, was assassinated by the Assassins in the cathedral at Tortosa. These were the same Assassins who had earlier attacked Conrad of Montferrat in 1192. In retaliation, Bohemond attacked the Assassins in their land north of Tripoli and east of Margat. This weakened Bohemond's alliance with az-Zahir, the latter who was also concerned about the news of a possible new Crusade being formed in the West. Innocent III had sent out the invitations to a new church council, what would be the Fourth Lateran Council in 1215, which had on its agenda a new Crusade. Thus the year 1213 brought a slight respite to Antioch itself, but the war over the Antiochene succession raged on.[281]

THE ART OF THE CRUSADERS BETWEEN 1192 AND 1210

This period was concerned with the reestablishment of the Latin Kingdom after the Third Crusade, as we have seen. Overall we can preface our discussion of the art of the Crusaders in this period by saying that, other than architecture, very little has survived. What can be recognized nonetheless suggests that there was a larger production that suffered more destruction, damage, and dispersal than usual, even in the turbulent Crusader East. The reasons for our difficulty in identifying works are numerous. Among the most important are the facts of the more or less continuous destruction and rebuilding of major Crusader cities and castles in the period, combined with the political and military turmoil over the rulers of the Latin Kingdom and the Principality of Antioch especially. These factors in the Crusader East combined with the complication caused by the Fourth Crusade, which unleashes a glittering avalanche of relics and presumably associated metalwork and painting on western Europe after the sack of Constantinople in April of 1204, result in serious problems in identifying artistic work from the Crusader States between 1192 and 1210. Nonetheless, the written sources yield some clues to what artistic activity went on. There are a very few extant works of art from this difficult period, and there are some works of art that provide us with indirect evidence of the production of the figural arts in the Holy Land.

All this being said we can in fact discern artistic activity – in some cases, vigorous activity – by the Crusaders in these years, and it is of the greatest importance that we turn our efforts to identify what we can. The artistic work of this period would form at least a partial basis for later activity, artistic production that has become visible mostly in the period after 1250. Can this later art help us understand its predecessors? Can we find in the work attributed to the period after 1250 any examples that may directly or indirectly reflect an earlier model? Are there works that may even have been wrongly attributed to a later phase of development when in fact they belong to the years around 1200?

Architecture

It is evident from the story of events in the Crusader East in this period that much architectural work was carried on during and after the Third Crusade, during and after the German Crusade of 1197, after the earthquake of 1202, and during and after the Fourth Crusade as men and materials were available. Quite possibly there was more rebuilding in this period than at almost any other time in the Crusader States. Much of what was done, however, is invisible to us. The problem of identifying most of this architecture resides in the fact that much of building activity was in the nature of rebuilding fortications, or even building new walls and towers. Therefore, most of it has disappeared in the process of later damage or reconstruction, it is often joined with other building or rebuilding campaigns that make it difficult to identify specifically, or it has disappeared in the face of later building projects that may even have mined these fortifications for construction materials. A few examples will suffice. In Acre, the land walls for the main part of the city that were rebuilt after 1202 no longer exist, and major portions of modern fortifications built in the eighteenth century are all that survive. It is difficult to identify a postearthquake-1202 phase in any of the remaining churches, commercial buildings, or residential buildings at Acre that belong to the Crusader period. However, the new Hospitaller compound in Acre must have been built at about this time, in the decade 1194–1204, after Guy de Lusignan granted them a large tract of land in the city in 1193.[282] Current excavations are shedding important

new light on this grand complex of buildings.[283] At Beirut we find a similar situation, where again the Crusader walls and the palace have disappeared and only the Church of St. John still survives.

Crac des Chevaliers

One important site where we can see and identify significant reconstruction work which is extant from after the 1202 earthquake at the moment is in the Castle of Crac des Chevaliers[284] (Figs. 22–28). Clearly the Hospitallers took the opportunity of rebuilding after the earthquake to strengthen the defensive system of the castle in a number of important ways. First the inner enclosure castle was given major new fortifications to supplement the rectangular tower at the north end (Figs. 24–26). These took the form of gigantic taluses on the southern and western side walls (Figs. 27 and 28), which were commanded above by a system of newly expanded round towers, three on the south side plus one on the west side to join the large machicolated rectangular tower from the twelfth century at the northwest corner (Fig. 26). The new glacis, rebuilt walls, and enlarged towers are constructed in impressive large stone and carefully fitted masonry. The curtain walls and towers have box machicolation, and there are arrow slits in the walls and in the center of each box machicolation. These rebuilt fortifications are among the most distinctive aspects of Crac des Chevaliers as we see it today, but they are joined by an entirely new system of concentric outer defensive walls (Fig. 28). The main extant early thirteenth-century portion of this system that survives intact is located along the west side of the castle, starting from the northwestern end and including the five round towers of this outer enceinte. These walls are much lower than the inner enclosure, approximately nine meters high, but they are strong and formidably defensible with a full set of arrow slits and box machicolations in both the curtain walls and towers. These systems are newly interdependent with the towers organized not only to strengthen the walls, but also to allow their defenders to support the defenders along the curtains. This support was realized by virtue of the projection of the towers beyond the face of the curtain walls and the positioning of arrow slits in the towers to provide for cross fire along the face of the walls,

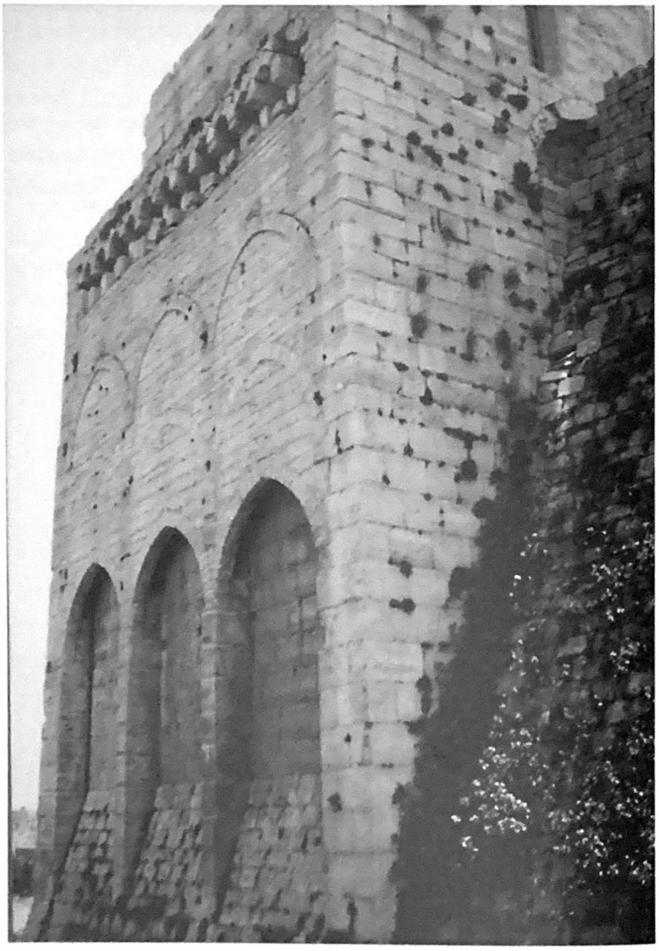
enabling the defenders to drive off possible mining, ramming, and scaling attempts by attackers.[285]

It is worth remembering that the achievements of Crac des Chevalier's defenses are justifiably celebrated among the greatest accomplishments of Crusader military architecture. In this regard it is significant to realize that a large measure of the defensive configuration that makes Crac so formidable, and so famous through the years, was accomplished by the Hospitallers in the campaign to rebuild the castle after the earthquake of 1202. Not only is this design and construction the most impressive part of what we see now as a large and complex defensive system,[286] but also it demonstrates significant innovation.[287] These defenses project great strength in terms of size and mass, offer formidable obstacles to any attacker in terms of optimum use of the site and the structure and organization of the defensive systems, and provide maximum protection for the Hospitaller defenders while allowing them effective means of delivering firepower to repulse attacks.

Although from the point of view of artistic achievement measured by architectural sculpture, painting, or other means of aesthetic enhancement, this phase of Crac des Chevaliers only preserves one notable example, the fresco of the Presentation of Christ, to be discussed later, the achievement here in military architecture was truly significant. Its importance can be considered from several points of view. In regard to contemporary defensive design, this castle shows notable innovation and sophisticated refinements. We can point to, for example, the impressive large stone ashlar masonry almost free of mortar with joins so tight one cannot insert a knife edge between the blocks, the almost fully concentric design,[288] the use of multiple round towers with curtains,[289] the arrow slit design and the use of box machicolation.[290] Furthermore, most of these innovative features, remarkably, are identified more or less simultaneously in Muslim defensive systems (e.g., at Aleppo and Damascus).[291] Clearly there appears to be simultaneous developments on both



26. Crac des Chevaliers: view of the rectangular tower at the northwest corner.

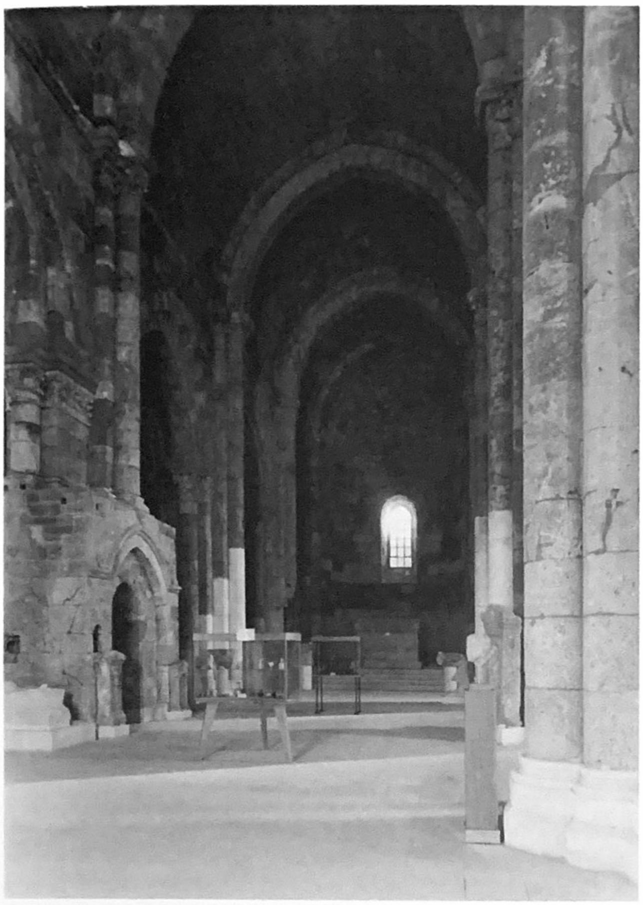
sides, and this evidence surely suggests knowledge about military architecture being transmitted across Crusader and Muslim lines.[292] This reflects the emphasis on military architecture at this time and the extent to which the substantial construction between 1192 and 1210 was generating rapid development. It is evident, however, that the size and scale of these fortifications at Crac des Chevaliers were extraordinary and carried out by accomplished masons of top quality whose work has survived the test of function and time. Crac des Chevaliers was never taken by frontal assault, only by siege and strategem.[293] It was never torn down, but only repaired and strengthened by its later Muslim occupants. It still stands today as the best preserved, the most impressive, and the most famous of Crusader castles in the Crusader States.

Finally, Crac des Chevaliers is an important example that we can use to measure and project the achievements of Crusader architecture elsewhere in the Crusader States, in terms of military design and construction, for those sites whose defenses built in this period no longer survive. I am thinking here of the fortifications that were rebuilt following the earthquake of 1202 at major cities such as Acre, Tyre, and Beirut, among others, as well as other castles, such as at Margat. Margat in particular is important, but we do not have an analytic study comparable to that by Deschamps for Crac, to identify and date its separate phases.

Looking at this period of 1192 to 1210 overall, we must recall that these numerous building campaigns, at the castles and on the various city walls, were the continuations in many cases of a long series of reconstructions. These rebuildings and new constructions had started after the reconquest of Crusader territory following Saladin's incursions in 1188. They were necessitated or facilitated as the case may be, by the destructions caused by, or the treaties and truces signed after, the Third Crusade in 1192 and the German Crusade in 1198, and the damages inflicted by the earthquake in 1202. Thus substantial defensive design and construction was underway over a sustained period of time, nearly a decade and a half, and we can consider the results at Crac des Chevaliers to show the fruits of these developments. Conversely we can use Crac to help us imagine the impressive fortifications that must have been given to the major city defensive systems that no longer survive. Furthermore we can realize more readily that this period must have been to some extent a prosperous one, despite the political turmoil, one that enabled the Crusaders to finance major building operations.

The obvious question that arises in light of the significant developments in military architecture is what comparable examples do we have for ecclesiastical architecture? We know that churches were damaged and required repair in Acre when the Third Crusade succeeded in taking the city. There may have been further needs after the earthquake of 1202 in Acre, not to mention Tyre, Beirut, and other cities that suffered heavier destruction such as Ascalon, Sidon, Caesarea, or Jaffa. In Acre much of the fabric of the Crusader city still survives in the old quarter, but the Cathedral of the Holy Cross was razed in modern times, possibly to make way for modern buildings, and the architecture of other Crusader churches in Acre is difficult to date as yet. Even Enlart did not attempt to date any churches to this period, 1192–1210, from St. Jean d'Acre. The excavated crypt of the Hospitaller Church of St. John still exists and may date from this period, according to Denys Pringle. We also have the so-called crypt of the Hospitaller compound with its pointed arches and its rib-vaulted bays featuring early square profile ribs, along with a capital decorated with a fleurs-de-lis, all of which may also belong to this period. Publication of the current excavations by the Israel Antiquities Authority and the forthcoming publication of Volume 3 of Pringle's corpus of Crusader churches will provide substantial information about the Hospitaller complex and other churches in the city that may belong to this phase of architectural development.

There is, however, one important church farther north that does warrant our attention in these years, namely, the Cathedral of Notre Dame in Tortosa.



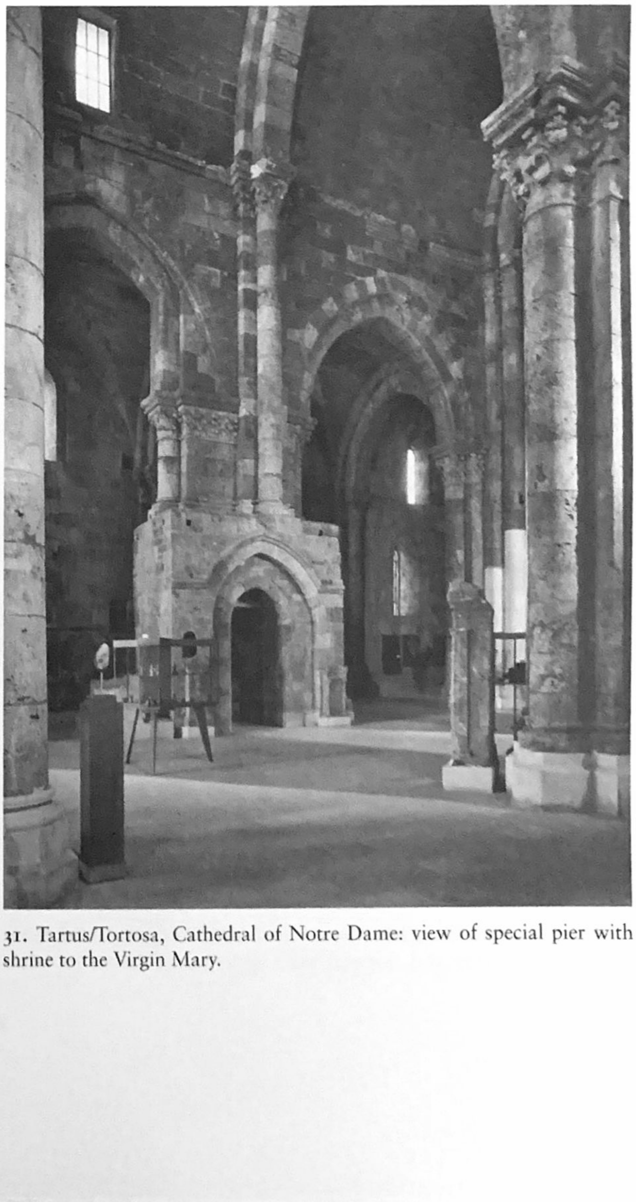
30. Tartus/Tortosa, Cathedral of Notre Dame: interior view of the nave.

The Cathedral Church of Notre Dame in Tortosa

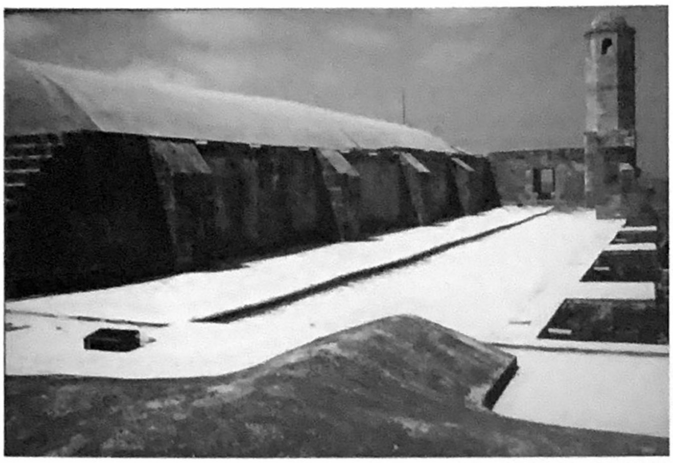
Notre Dame in Tortosa was probably left unfinished, and Muslim sources claim that it was seriously damaged, during the heavy fighting that accompanied Saladin's attack on the town in early July 1188.[294] But the Templars never lost their castle at Tartus and it became their most important center in the northern part of the Crusader States, that is, in Tripoli and Antioch. Therefore when the Templars reclaimed the town following Saladin's departure, no doubt the cathedral church received immediate attention and repairs were made. One of the reasons for the prompt attention was Templar protection for Tortosa. But another reason, perhaps even more important, was the new prominence of this church as a pilgrimage site.

There was located in the Church of Notre Dame (Figs. 29–35), according to one tradition, the oldest shrine in Christendom dedicated to the Virgin Mary (Fig. 31). It was said to be as old, or even slightly older than the church of the Annunciation in Nazareth, or the church of St. Mary Mount Zion in Jerusalem, both of which also claimed apostolic foundation.[295] The claim to be the oldest church or chapel may have been thirteenth-century hyperbole once Jerusalem and Nazareth were no longer readily accessible as pilgrimage sites. In any case, by the twelfth century it was believed to have been founded by the apostles led by St. Peter, and the main altar was consecrated by Peter. Here it is reported that one could see an authentic icon of the Virgin and Child painted by St. Luke.[296]

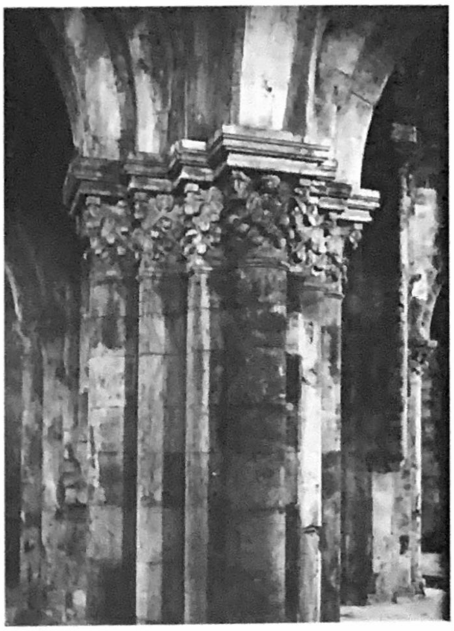
Although everyone who has studied the church to date seems to think that it was not completed until the mid-thirteenth century, Enlart, among others, has proposed that some significant new work was done on the church in the early thirteenth century, presumably as part of the repairs needed after the damage at the time of Saladin's incursion, and in particular after the 1202 earthquake.[297] He finds this work in the fabric of the church located where the enlarged base of the pier on the north side of the nave has received a passage perpendicular to the axis of the nave. It is this unusual structure and its handsome sculpture, especially the carved capitals with naturalistic foliate designs that are associated with it, that Enlart identifies to be the most important part of the work done about 1202.[298] Beyond this, it is difficult to identify specific work done at the start of the thirteenth century. Given the importance that this shrine of the Virgin Mary enjoyed at this time, based partly on the testimony of Bishop Conrad of Halberstadt, who came there to be healed in 1205,[299] I assume the church, although presumably still incomplete, would have been rendered functional immediately after the earthquake of 1202 and that the pilgrimage shrine, its most important feature for visitors, would have been rebuilt fully at that time. On the other hand, the completion of the rest of the church at the west end (Fig. 30), some of the groin vaulting (Fig. 33), and the new foliate-style Gothic capitals (Fig. 34) would apparently only have been accomplished later, by the second quarter of the century, when incidentally, the pilgrimage to Tortosa was at its peak.



31. Tartus/Tortosa, Cathedral of Notre Dame: view of special pier with shrine to the Virgin Mary.

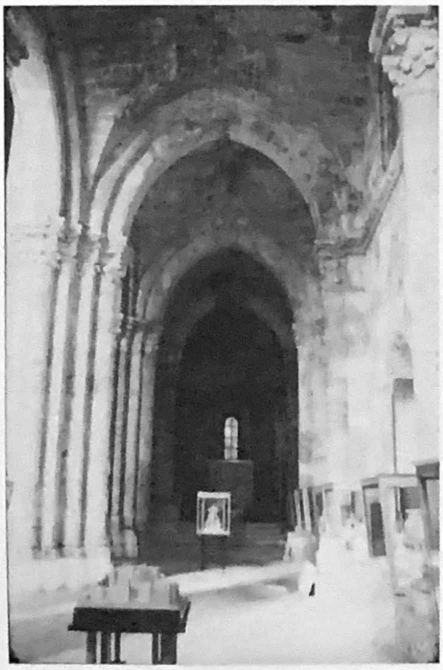


32. Tartus/Tortosa, Cathedral of Notre Dame: view of the roof on the north side.



34. Tartus/Tortosa, Cathedral of Notre Dame: foliate capitals.

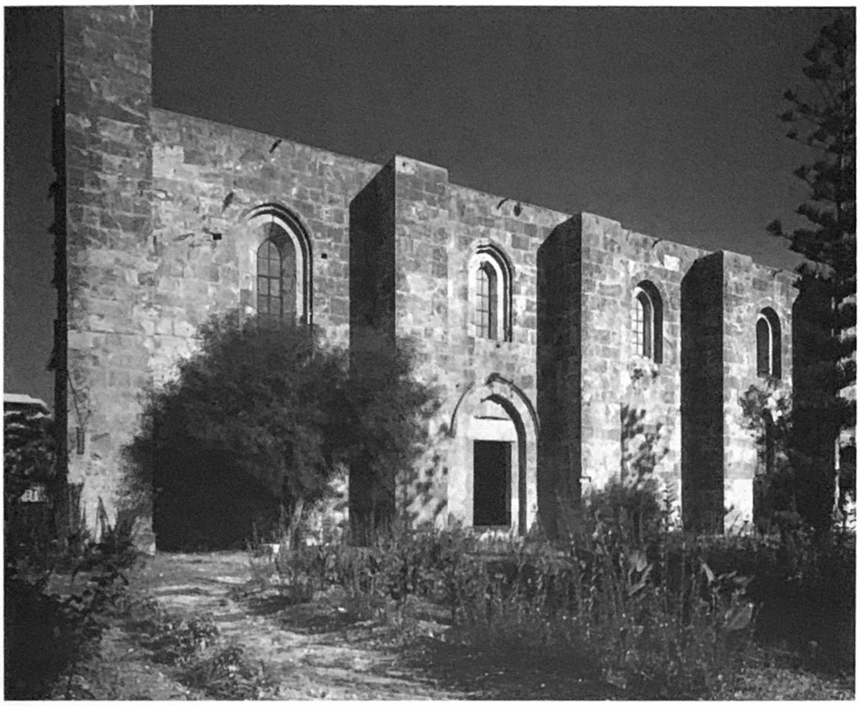
Despite the importance of this church and its relatively large size, the fact is that it still seems to be somewhat austere, rather simple with few decorations for a Gothic building, and it clearly projects a muscular, fortified appearance on the exterior with its strong buttresses, heavy walls, and a flat roof line (Fig. 32). The fact that as a church with certain new Gothic features, such as the forms of its portals and windows, the pointed arches, and the colonnettes, moldings, and naturalistic foliate designs, it is still so conservative, so low and heavy in proportions, and so wall-oriented with small openings reflects a number of important points. First, this church was designed and built in the second half of the twelfth century when the Crusader levantine Romanesque was the mainstream architectural style, and even in terms of that development this church seems heavily endowed with buttresses and somewhat austere (Fig. 35). Second, much of the "Gothic" aspect of this church is applied later in the form of refinements but was not incorporated in terms of any extensive rebuilding that might have produced the use of more obvious Gothic building techniques and vaulting systems. Third, this church was built in a region – the northern part of the County of Tripoli and the southern part of the principality of Antioch – where the dominant architectural activity at this point was military construction. Thus it appears the thinking about church architecture here and the execution at the hands of the local masons, many of whom who probably had worked on the fortifications of Tortosa if not some of the major castles nearby, was carried out to some extent under the influence of the aesthetics of the contemporary military architecture.[300]



33. Tartus/Tortosa, Cathedral of Notre Dame: groin vaulting in the south aisle.

The Church of Notre Dame at Tortosa, in contrast to other contemporary but smaller chapels started in the twelfth century and repaired at this time,[301] is the sole major survivor of the new urban ecclesiastical architecture at this time. It provides important evidence to demonstrate that church architecture continued to develop along with the significant innovations in military fortifications. No doubt other notable churches were also built in Crusader port cities farther south during these years, especially in Acre, but they no longer survive for us to examine.

The perhaps surprising indication that emerges from our consideration of Crac and the church at Tortosa is that, despite the absence of any extensive survivals of widespread church architecture in these years, there was vigorous architectural activity, both military and ecclesiastical. This activity is striking, but the fact is that little of it is reflected in the accounts of political turmoil and uncertainty that fills the pages of the various versions of the Eracles or the *Chronique d'Ernoul*. Yet even though these narrative written sources do not shed much light on the sizeable commitment of Crusader men, resources, and creative energy to these architectural projects, whether military or ecclesiastical, except perhaps for the description of the building campaign at Ascalon during the Third Crusade, we can at least glimpse in these major examples how important they were. The Fourth Crusade then, in effect, further diminishes our ability to "observe" the architectural activity in the Crusader States by dropping a veil that obscures the view of



35. Tartus/Tortosa, Cathedral of Notre Dame: exterior view from the south with buttresses and the flat roof line. (photo: Anthony F. Kersting)

the Crusader States from the West, and diverts attention in the chronicles away from Syria-Palestine between 1201 and 1204 and later. Nonetheless, we should not lose sight of the important architectural work underway in the Crusader States between 1192 and 1210. Had there been a major detailed narrative chronicle written by a participant in the Fourth Crusade who, unlike Geoffrey de Villehardouin or Robert de Clari, had not considered their Crusade vow to be fulfilled by the conquest of Constantinople but who had continued on to the Holy Land and had given a full report on their activities there, we might have had a much clearer picture of developments there in these years than we do now.

Finally, Steven Runciman, writing in 1954, made an insightful observation that deserves to be quoted here, to frame our other remarks about the art of the Crusaders between 1192 and 1210: "The slightness of the [artistic] evidence should not be interpreted to mean that little was done. If architecture flourished, it is likely that the other arts flourished also, and gave the same reflection of life in Outremer."[302] In light of this comment we are challenged to identify and characterize what important artistic activity there was that paralleled the new developments in the architecture.

Coinage

In contrast to the military architecture, in coinage there were few new developments in this period. Given the political situation, it appears that most coinage tended to be quite conservative, either employing immobilized issues or introducing rather simple types already familiar in the context of coinage in the Crusader States and Cyprus. Indications are that the royal coinage maintained the immobilized Amalric type deniers with the distinctive Holy Sepulcher obverse imagery, despite considerable scholarly discussion over the nature of these coins.[303] The use of gold bezants imitative of Fatimid coinage continued in the Latin Kingdom. And the most important baronial coinage was found in Beirut and Sidon, with conservative coin types retained farther north in the County of Tripoli and the principality of Antioch.

In observing how few major innovations can be seen in the Crusader coinage during these years, 1192–1210, we must not, however, imagine that little coinage was struck. Despite the nature of the coinage and the difficulties caused by the rapidly changing rulers in some cases or by the contested lordships in others, this appears to have been a prosperous period in which the supply of coinage was maintained to facilitate financial health for the Crusader States.

The minting of coins in the period 1192 to 1210 appears to have been, compared with the years 1187–92, relatively stable, with few new issues and none of the special issues we have seen in the earlier period. This reflects the more controlled circumstances in the Crusader States without the disruptions of major military invasions and the subsequent upheavals caused by the Muslims, which were such a feature of the years between the battle of Hattin in 1187 and the Treaty of Jaffa in 1192. It is nonetheless well to remember once again the caution expressed by Metcalf about this larger period as a whole: "What happened to the currency between the 1180s and the 1220s? We have a gap of no less than 40 years in the hoard evidence. Until some new hoards come to light to help us, our reconstruction of monetary history during those 40 years is bound to rest on extrapolation."[304]

For the royal coinage, three men were important in the period 1192–1210: Henry of Champagne (1192–7), Aimery II (1197–1205), and John of Ibelin (regent, 1205–10). We have already seen in Chapter 2 that Henry of Champagne introduced copper coins that are quite French in appearance, although not drawn from types in Champagne. One copper coin type employs the

38. Acre, cut gold fragments. (photo: after Metcalf, *Coinage of the Crusades*)

title "+COMES HENRICUS" with a cross on the obverse, and on the reverse, a six-pointed star – relatively rare, or a fleur-de-lis, with the unusual designation of its denomination: "+PUGES DACCON."[305]

A silver coin thought possibly to be the companion to these *pougeoises* does not carry the name of the ruler (Fig. 36). Instead it is designated "+DRAGMA ACCONENSIS" with the cross on the obverse, and on the reverse, "+SEPULCHRI DOMINI" with an image of the Holy Sepulcher much as we found it on the deniers of Amalric. There is no consensus on the date of this coin. Metcalf thinks it may possibly date from the reign of Count Henry, in which case it would be a very early coin of the gros type, or a multiple denier. Porteous dates it later, to 1220–40, after Venice had started minting silver grossos, when such coins were becoming more common.[306] Metcalf's argument is intriguing.[307] By using the word "SEPULCHRI" in the genitive, it means that this was a drachma of Acre of the Sepulcher of the Lord. He thinks it is a coin deliberately struck in the amount equivalent to a Muslim dirham for use by pilgrims to Jerusalem in the period following the Treaty of Jaffa. The reference to the Sepulcher and not Count Henry would seem to suggest this function as a real possibility. Certainly we cannot imagine the patriarch of Jerusalem issuing such a coin. My question would be whether we could consider this to be a possible coin type issued by the regent John of Ibelin who otherwise would not be expected to have coins bearing his name. In any case, few of these coins survive. If it is a coin issued by Count Henry or by the Regent John of Ibelin, this denomination would not be continued until the new king, John of Brienne, takes up this type in 1210.

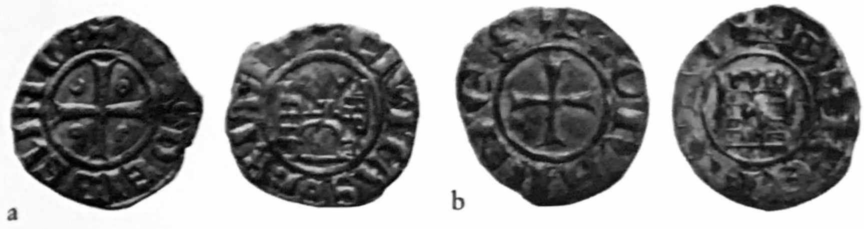
Count Henry was followed by King Aimery II. The only coin firmly attributed to Aimery, or in fact to John of Ibelin, is an immobilized type (Fig. 37). It is a denier with "AMALRICUS REX" and the cross on the obverse, and "+de ierusalem" on the reverse with the image of the Holy Sepulcher, as found both on the coinage of King Amalric, and the mysterious dragmas mentioned earlier.[308] Some controversy surrounds the question of how many of these coins were issued by Aimery II or any of Amalric's successors.[309]

37. Acre, billon denier, *Amalricus Rex*, immobilized type. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)

The new gold bezants, of approximately 68 percent gold instead of the earlier 80 percent gold content, introduced after 1188, apparently continue to be produced in this period with no special features.[310] The main problem for the period 1192–1210 is that few can be identified to have been struck in those specific years. The most controversial coinage related to the royal mints in these years, however, concerns the cut gold bezants[311] (Fig. 38). Most of the cut gold has a partial inscription that can be reconstructed as bearing the names "AMALRICUS" or "BALDUINUS." A few have "CON" or "COM" and have been interpreted as having the designation, "Comes Henricus." The extraordinary and puzzling fact about these cut gold pieces is that no complete coin of these types has ever been found. Furthermore it is not clear what their function may have been. Metcalf has conjectured that they may have been used as offering pieces by pilgrims.

The situation with baronial coinage was surprisingly meager. Because of a passage in the "Livre au Roi" that restricts the minting of coins to the king and the idea that the power of the king had been severely compromised following 1187, it has been proposed that coinage by Crusader lords proliferated.[312] In fact this does not appear to be the case. There is almost nothing known in this period from Tyre or Jaffa; only Beirut and Sidon have any new types to speak of, and they are quite conservative and typically Crusader. In Beirut, John of Ibelin produced deniers in two types found in this early phase with variant inscriptions on the obverse and reverse, either "+IOHANNES" or "+IOHSDEIBELINO" on the former, and "+CIVITAS BERITI" or "+DEBERITI" on the latter.[313] The reverse featured a typically Crusader architectural motif of a fortified city gate with arched portal and two turrets (Fig. 39).

Sidon is the most surprising case, because whereas the other fiefs were held mostly through this period, Sidon was in a ruinous state until 1197 and then even though nominally under Crusader control after 1204, Crusader rule did not effectively return until well after 1210, namely, after 1227. Despite all this, coins were issued. The early ones were minted by Raynald of Sidon from the 1170s until about 1204 (Fig. 40). They were inscribed "+RENALDUS" on the obverse with a fortified tower, again the Crusader architectural motif, and on the reverse, "+Sydonia" with an arrow. The arrow was a pun on the Old French name for Sidon, "sagète" or "saiette."[314] The most common coin type from Sidon that followed this was issued by Balian Grenier, but it is not clear whether it appeared before 1227 or not (Fig. 41). This coin is remarkable because, like the *pougeoise* of Henry of Champagne, it carries the denomination on the obverse: "+DENIER" with the cross.[315] On the obverse the typical Crusader architectural motif is rendered as a



39. Beirut, billon denier of John of Ibelin. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)

handsome arched building with a two-story central tower topped by a cupola.[316] The cross for the cupola is supplied by the start of the inscription above.

The coinage farther north was similarly conservative. In the period, 1192–1210, the Tripoli bezant appears to have maintained its traditional type but followed the lead of the royal mints in reducing the gold content, debasing the coins from 80 percent to 62 percent, that is, 4 or 5 percent lower than with the royal coins.[317] Tripoli produced its characteristic eight-pointed star deniers in the name of Bohemond IV between 1187 and 1233, but in the same period it maintained the typical Crusader architectural motif with a copious series of copper "castle" coins that feature a fortified gateway.[318] Meanwhile Antioch continued its distinctive "helmet" denier. The primary variation appears to have been the reversal of the head to a position looking left and an inversion of the chain armor so that the crescents are curving downward, which Metcalf dates to the period 1188–1216[319] (Fig. 42). It is worthy of note that during this same period the Armenian king, Levon I, also issued a denier with a cross and his name, "+LEO DEI GRATIAS," on the obverse and a crowned bust-length king on the reverse and the inscription "+REX ARMENIOR." This is a rare coin; Metcalf cites five specimens with the Latin inscriptions, and he mentions only two with the inscriptions in Armenian.[320] It is interesting the extent to which Levon copies Western royal issues in his coin type, even though the shape of his crown is Armenian, not English or French as his models must have been.

Finally, one of the most important changes in coinage in the Crusader States is described by Metcalf as follows:

> If European deniers were imported into the Crusader principalities in the decades before the fall of the First Kingdom [1187–1188], it would seem that in principle they were required to be melted down and reminted into the official issues of the Latin Kings or the counts of Tripoli or the princes of Antioch.... From the time of the Third Crusade a totally different situation obtained in the Latin Kingdom.... A profuse variety of French, Italian, and other west European coins are found in five important hoards from Tripoli, Kessab, Châtellerault, the Lebanon, and Syria, all from the early thirteenth century....
>
> It is not possible to construct precise figures, because loss-rates may have varied from decade to decade, but it seems safe to say that millions of European coins accumulated in the Latin East mainly ... in the last decade of the twelfth and the first quarter of the thirteenth century.[321]

The introduction of significant numbers of western European coins is a phenomenon that parallels the situation during and after the First Crusade, but the numbers involved were apparently greater in the 1190s and 1200s. The European coins are significant evidence that Western aid for the Holy Land was flowing West to East. One of the landmarks to this support was the treasure sent by the Cistercians to aid the Holy Land, money received as contributions for the Fourth Crusade as the result of the inspirational preaching of Fulk of Neuilly and his compatriots.[322] It is a period, therefore, when we can see the development of a new expectation by the Crusaders for Europe to send aid, in the form of money, military or ecclesiastical manpower, or works of art primarily for ecclesiastical use. So far the relevant hoards found in the Near East have yielded representative indications of the new presence of these Western coins, including a remarkable variety of sources. Metcalf illustrates examples from the following: Angoulême, Anjou, Berry, Bourbonnais, Bourgogne, Bretagne, Champagne, Languedoc, Limousin, Normandy, Orleanais, Poitou, Touraine, as well as Ancona, Venice, Sicily, and England. Compared with the Western coins that one finds in the Crusader East after the First Crusade, this list shows new emphasis on France, scarcity of coins from Italy, a virtual absence of coins from Germany, but greater diversity in places of origin. The lack of hoards from the period *c.*1180 to *c.*1220 remains as a great obstacle to understanding the complete range of these coins, and the full nature of Crusader coinage throughout this period however.

Textiles and Metalwork

Textiles: We have seen the importance of religious metalwork in this period indirectly in relation to the enormous traffic in relics associated with the Fourth Crusade, relics which were sent from

Constantinople to the West. We also know that relics, and the reliquaries that contained them, continued to be an important part of devotional life in the Holy Land. Furthermore, because so many reliquaries were sold, lost, or even destroyed at the time of Saladin's invasions in 1187–8, there is no doubt that many reliquaries and other liturgical vessals had to be replaced when the Crusaders reestablished themselves in new quarters, in Tyre, in Tripoli, in Antioch between 1187 and 1192, or in Acre after 1192.

Part of our problem is the lack of records of any sort, inventories, hand lists, and the like to help us assess what the losses were in 1187–8. Even if, as we proposed in Chapter 2, clerics may have attempted to preserve their church treasures, including reliquaries, by various means, no doubt much could not be saved. In view of the magnitude of the losses in these two years, however, headlined in particular by the loss of the relic of the True Cross at the battle of Hattin, we can entertain the likelihood that some replacement relics were identified and new reliquaries were produced in the Holy Land itself. Certainly the possibility that Martin of Pairis acquired a set of relics from various holy sites during his stay in Acre is a concrete bit of evidence that relics and reliquaries from the Crusader Holy Land were still in demand and were still being produced in the Latin Kingdom, possibly now in Acre.[323] Certainly there was the possibility that some replacement metalwork, liturgical vessels and precious objects with enamel or in ivory from the West, may have been sent to the Holy Land with new clergy appointed there.[324] The specific request that Baldwin I in Constantinople made to the pope for the needs of the Latin liturgy in the Latin Empire,[325] can, mutatis mutandis, perhaps be applied to the new patriarch and bishops in the Latin Kingdom in terms of certain kinds of liturgical metalwork as well as liturgical books in Latin.[326] What does not seem to be likely, in the absence of any evidence to the contrary, is that any significant amount of the Byzantine religious metalwork harvested from the sack of Constantinople in 1204 was sent to the Crusader States to help supply their needs.[327] We can make this statement judging from the experience of Martin of Pairis, who was in the Holy Land with his religious booty from Constantinople after the sack, and who declined to donate a single reliquary from his collection to any establishment in the Latin Kingdom despite the impassioned requests of Werner of Egisheim.[328] For Abbot Martin, his monastery back home in western Europe came first.

One of our most important sources of evidence for the contents of a church treasury, including some metalwork, and other liturgical objects, especially textiles, that a major Crusader church would have and would need, is found in an important Hospitaller document from Antioch. In 1209, when Peter of Ivrea, patriarch of Antioch, arrived to take control of his see, the treasury of his patriarchal church, which had been deposited by the previous patriarch, Peter of Angoulême, into the protective hands of the Hospitallers, was turned over to the new patriarch. The inventory of this treasury is extant and its contents provide us with an invaluable look at what a bishop, or in this case, the patriarch, possessed in liturgical objects, including metalwork but most especially pontifical vestments.[329]

> Petrus, Dei gratia sancte et apostolice sedis Antiochene patriarcha.... Sciant omnes... quod nos, de commenda quam deposuit Petrus felicis memorie,..., in domo Hospitalis in Antiochia,[330] a thesaurario ejusdem domus..., videlicet et omnia ea que nominantur et exprimuntur in hoc scripto:
>
> videlicet veram crucem auream, margaritis et aliis lapidibus preciosis ornatam;[331]

> Hec omnia, sicut continentur in hoc scripto, plenarie recepimus a fratre Garssione Asmaldi, thesaurario Hospitalis in Antiochia, et fratre Petro Galeis, et fratre Pascali, et fratre Thoma.

This document is attested by twelve witnesses and dated October 1209.

Clearly we find here the basic holdings of a major episcopal church treasury in terms of liturgical books, vessels, objects, and liturgical vestments. There are, however, some striking features about this inventory that merit comment. First, it is clear that this is an episcopal or pontifical treasury, so that many of the vestments are specifically and uniquely for the use of a bishop. Despite the fact that most of the objects listed consist of liturgical vestments, in this case for the patriarch, there are certain minor omissions. We do not find any liturgical stockings, "caligae," for example, despite the fact there are two pairs of sandals and an array of other remarkable pontifical vestments, to be used only by a bishop (e.g., a stole only for confirmation rituals). Second, there are a number of books, some listed as "texta" meaning gospelbooks in this context and some listed as specific service books, and a number of liturgical objects, such as chalices or golden crosses, but conspicuously lacking are relics of any sort. Whereas this inventory was the patriarch's, the complete inventory of the treasury of the Cathedral of St. Peter in Antioch, which we do not have, presumably would have listed the relics and other liturgical objects owned by the church. The few objects that are listed in the present inventory include two chalices, two pectorals, a vase, an "icona" of silver, and two croziers. Three of the manuscripts listed also have treasure bindings with silver or gold covers, the latter decorated with pearls and other precious stones.

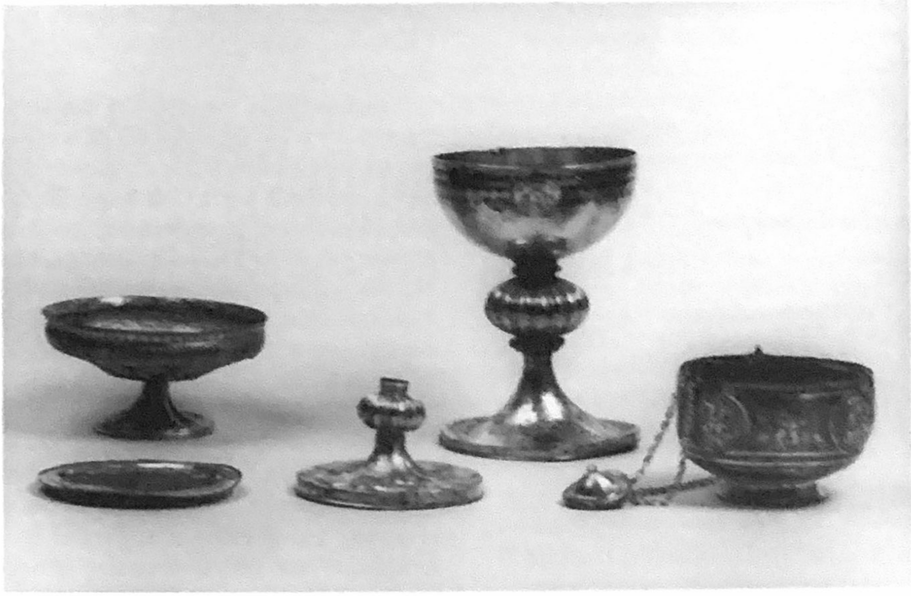
This inventory therefore gives us an invaluable list of the liturgical vestments available for the use of the patriarch of Antioch in 1209. The sad fact is that although we have the list, we do not have a single example of these vestments from the Crusader East at this time, from Antioch or from anywhere else, except for a miter commissioned and executed in the East attributed to Jacques de Vitry, discussed in Chapter 4. Despite the fact that Antioch, Tyre, and Tripoli were production centers for textiles, nothing from this period appears to survive independently, or at least nothing survives that has as yet been recognized as such. In the West there are collections of liturgical vestments in various church treasuries at this time,[347] and sumptuous textiles attributed as "Sicilian" or "Byzantine" from these years are found in certain collections,[348] but so far I have found nothing identified as Crusader and attributed to the years 1192–1210.

It is difficult to evaluate the contents of this inventory on its own terms in the absence of a similar document for the patriarch of Jerusalem, or a comparable listing for some other bishop or church in the Holy Land. We do not know what Patriarch Heraclius of Jerusalem succeeded in collecting and transporting out of the Holy City at the time of Saladin's conquest. Nor do we know where exactly he went seeking safe refuge. Presumably he went to Tyre or Tripoli, and not Antioch.[349] In any case there is no indication that any of the items listed in the 1209 inventory of the treasury of the patriarch of Antioch contained any of the objects that were saved by Heraclius.

It is interesting to compare this list with a later inventory of the treasury of the Church of Notre Dame in Paris, dated 1343 and revised in 1416.[350] The categories from the 1416 inventory are as follows: 1. Joyaux, 2. Crosses, 3. Chalices, 4. Croziers and Bishop's Staffs, 5. Books, 6. Altar Cloths, 7. Liturgical Canopies, 8. Textiles, 9. Vestments. We note that the Antioch list corresponds closely to the later list in terms of what is contained in the treasury, with the exception of joyaux and canopies. It is evident that the reliquaries belonging to the church are not part of this treasury, just as must have been the case in Antioch.

Certain well-known treasuries did contain, indeed featured relics and reliquaries, and joyaux, such as the special French royal treasuries at St. Denis and in the Sainte Chapelle,[351] or the treasury of Christchurch, Canterbury.[352] It is the inventories of Christchurch that most clearly suggest the nature of the Antioch list; the Canterbury lists include a complete inventory, whereas the Antioch list is only a partial inventory. With specific reference to the Antioch list, for the 1294 and 1328 Canterbury inventories, it is noted that "it was customary from an early date for an archbishop or bishop to have for the performance of his duties as bishop a set of ornaments which he could take about with him. These ornaments were collectively known as his *capella* or 'chapel,' and included all the articles necessary for the pontifical offices, and sometimes the sompter horse or horses that bore them from place to place, and the chests in which they were carried."[353] The Antioch inventory is comparable, focused on liturgical objects and vestments, no doubt the ornaments of the *capella* of the patriarch of Antioch. We note that some books are contained in the Antioch, as later in the Paris and Christchurch Canterbury inventories. The sad fact is, however, that, as is the case with the textiles and other objects, few such books are extant from church treasuries in the Crusader East.

Metalwork: The issue of metalwork being brought from the West to the Crusader East is problematic, and specific examples are difficult to identify, despite the textual indications and practical considerations that make such activity likely. It is therefore remarkable that our prime examples in this period turn out to be a handsome group of pieces containing both aristocratic silver for secular use and liturgical silver for use at mass. Furthermore, they appear in a site that was not under Crusader control, but the objects in question seem clearly to have been in Crusader hands before they came to Resafa-Sergiopolis in Syria. This city was, of course, the revered site of the tomb



43. The Resafa Silver Treasure: View of the various pieces in the silver treasure. (photo: by courtesy of Tilo Ulbert, German Archaeological Institute, Resafa-Archiv)

of St. Sergios since the fourth century, which continued to be honored until the sack of the city in 1259.

In 1982 excavators working at Resafa-Sergiopolis for the German Archeological Institute in Damascus discovered a hoard of silver preserved in a large earthenware vase. The vase was found in the north court of the peristyle of the Basilica of the Holy Cross. The archeological stratigraphy and other evidence indicates that this layer of material belonged to the period 1243–59. The objects in this vase include a ciborium or lamp, a paten, a chalice, a chalice base, and a cup decorated with eleven heraldic escutcheons[354] (Fig. 43).

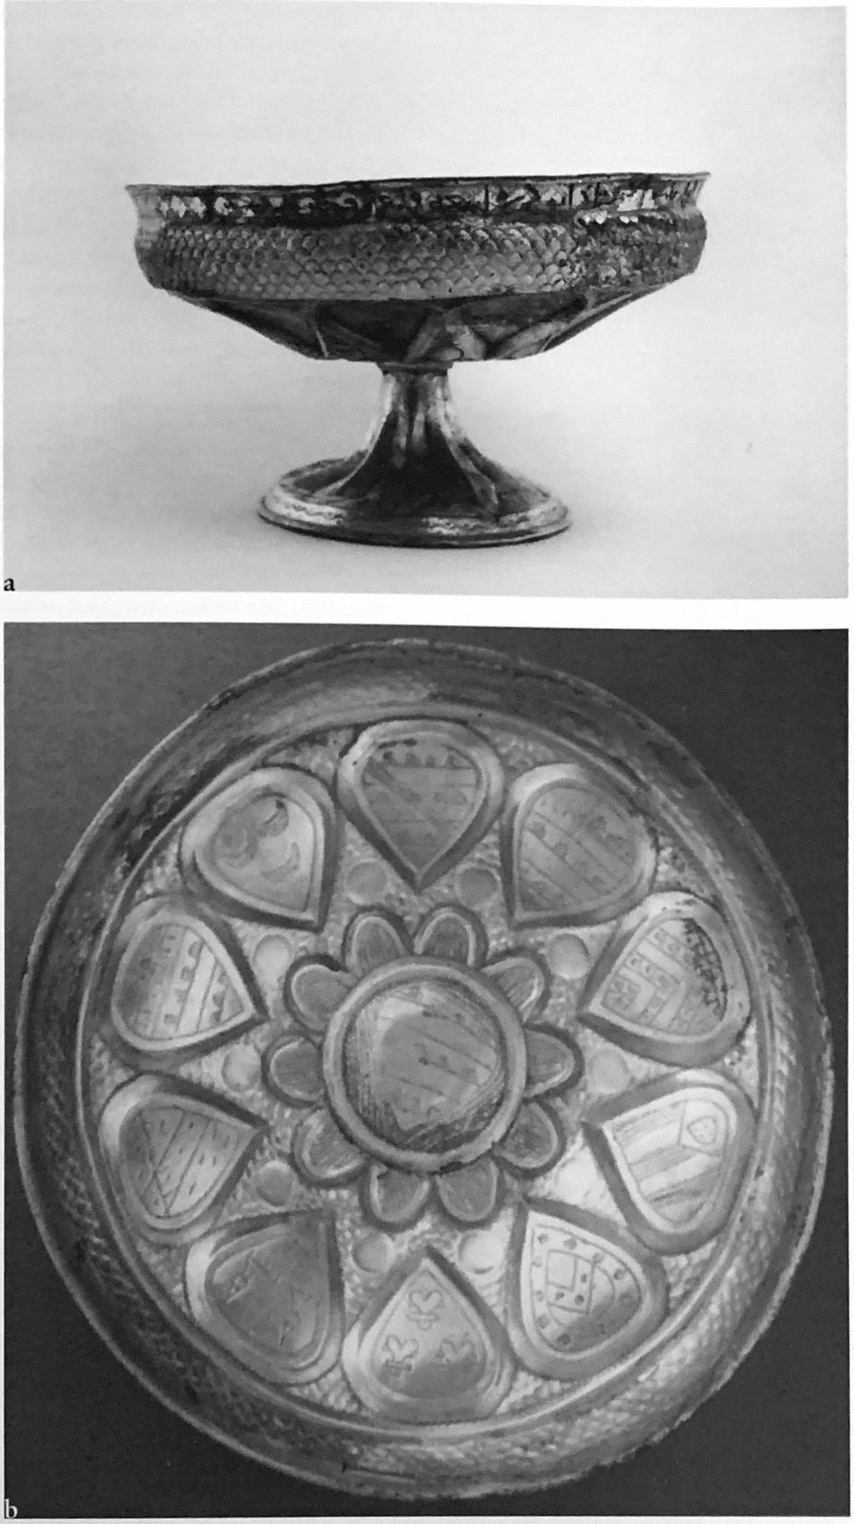
The "Wappenpokal": The cup, a "wappenpokal,"[355] is executed in gilded silver, and measures 4.3 cm high and 16.0 cm in diameter (Fig. 44). In the bowl of the cup are eleven shields with arms as yet not fully identified. The specific shape of the shields on which the arms appear can be linked with a number of examples dated in the period *c.*1200, belonging to the following nobles: Robert de Chartres (1193), Pierre de Gamaches (1195), Jean de Douai (*c.*1200), Guillaume de Barres (1200), Renaud de Dammartin (1204), Hughes de Lourci (1213), Hélie II de Wavrin (1214), Ansel de Boloville (1219), and Hughes de Candavène (1223). The central shield appears to bear the arms of the Coucy family, and the likely owner is Enguerrand III de Coucy, with relatives indicated by the arms of nos. 3, 5, and 6.

In sum, it appears that this cup was made in France in the late twelfth century, possibly carried to the Holy Land by a participant in the Third Crusade. In use in the Latin Kingdom, the last shields may have been engraved in the early thirteenth century. The cup then came into the hands of Zayn ad-Dar, daughter of Abu Durra, who had a commemorative Arabic inscription placed on it. She in turn may have given it to the church in Resafa-Sergiopolis.

The wappenpokal is the most important piece of secular silver we have from the Crusader Levant in the thirteenth century, and the only piece with such a rich collection of heraldic arms. There are four other items in this hoard of silver, all of which seem to be religious, indeed liturgical in nature. Some of these pieces, but not necessarily all, may also have been manufactured in the West then brought to the East and reworked with additions consisting of images or inscriptions. The four objects in question are an engraved chalice, a chalice foot, a paten, and what appears to be a lamp or even a censer.

The Chalice: The chalice[356] (Fig. 45) is a remarkable work because it combines three distinctive traditions: first, the shape is recognizably Western for the chalice, different from Byzantine-style liturgical vessels of this kind with its generous bowl, large node, and very large foot with a diameter bigger than that of the bowl. Second, there is engraved Byzantine decoration found on the exterior – medallions of Christ Pantokrator with Greek inscriptions – and interior – an image of the Virgin and Child enthroned between Sts. Michael and Gabriel, the latter identified by Greek inscriptions – of the bowl. Also on the foot of the chalice are four Byzantine-style crosses designed with round terminals and a flaring base, a type well-known from middle Byzantine art. Third, around the upper part of the bowl exterior, we find a handsome niello decorative motif with pendent palmettes, in which a golden Syriac inscription has been inserted. The Syriac inscription reads: "To the honor of the chalice, which to your disciple as a pledge has been given, Iwannis has donated this, that your blood is reserved, oh bringer of mercy. And see: he bears you as a bequest. Received and rewarded appropriate to your promise and the offering of the priest."[357] A comparable inscription in Syriac executed in niello is found on the foot of this chalice as well.

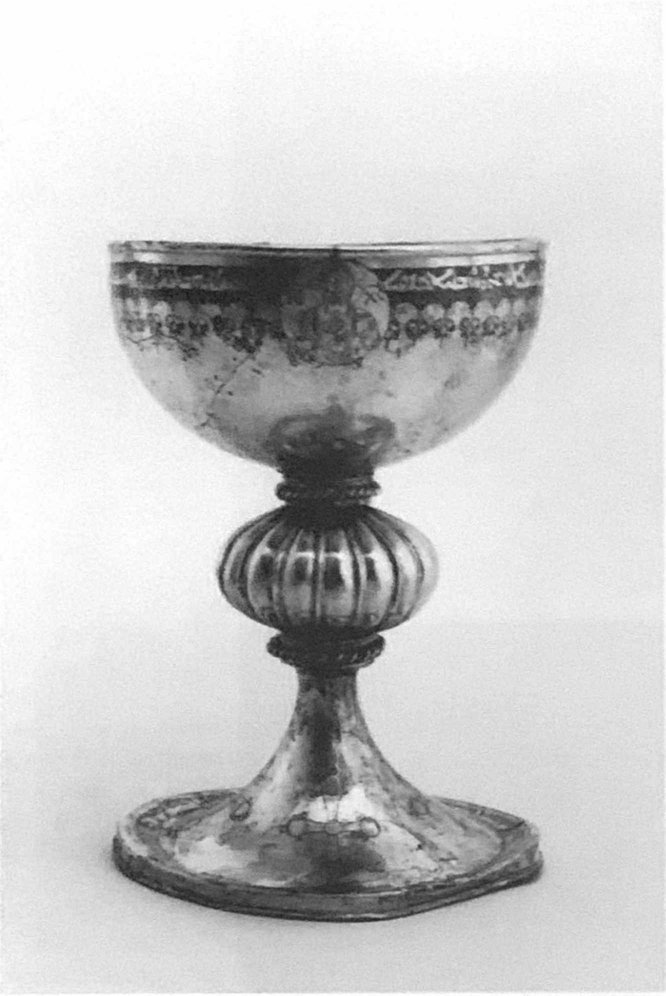
The Chalice Foot: The chalice foot[358] (Fig. 46) and its node are extant, but the bowl is lost. It has a similar overall Western shape to the previous chalice just described, but the details of the decoration of the foot and the node are different. The foot has a graceful two-tiered petal design, but no engraved



44. The Wappenpokal. A. exterior, B. Interior (photos: by courtesy of Tilo Ulbert, German Archaeological Institute, Resafa-Archiv)

decoration. The node is quite round in profile and is sculpted vertically with tripartite ribs, while the ball of the node and the neck above and below the node has decorative cross-hatching. This foot is slightly smaller than the complete chalice, and the decoration of the oval flaring node there with the twisted rope design on the stem of the chalice above and below the node is distinct from the chalice foot seen here. There are no inscriptions extant on this chalice foot.

The Paten: The paten[359] (Fig. 47) is a work meant to go with the chalice for which Western parallels are cited from Troyes and Assisi. It also has engraved decoration consisting of a medallion

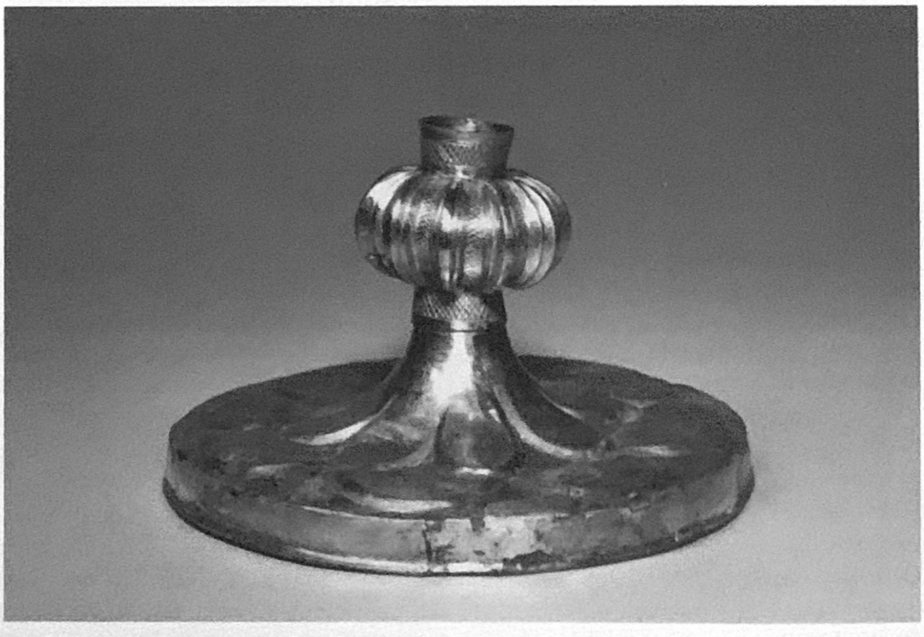


45. The Chalice. (photo: by courtesy of Tilo Ulbert, German Archaeological Institute, Resafa-Archiv)

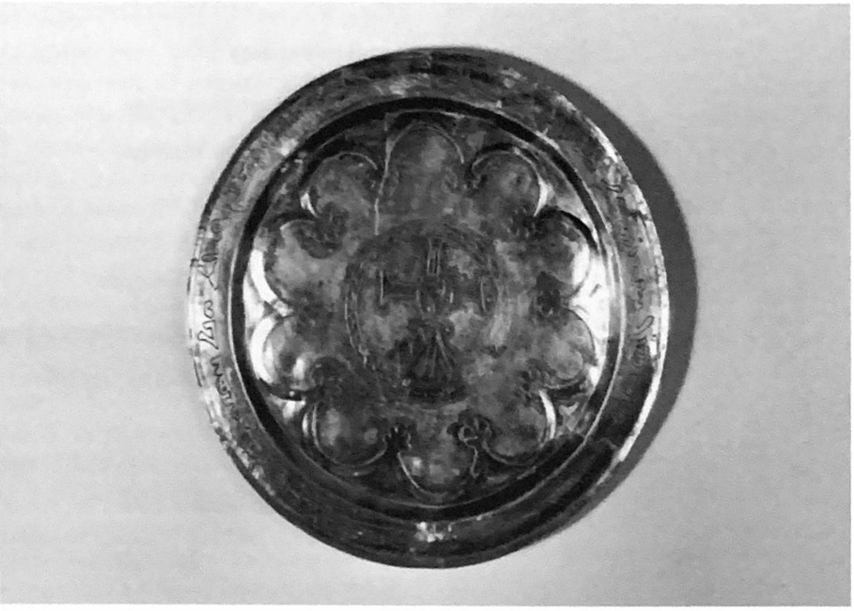
in the center with the hand of God blessing in the Latin mode set against a Latin cross, three parts of which are visible. The medallion has an undulating cloudy line articulating the interior of its circle. The hand is given a large cuff at the wrist, and a flaring sleeve with a strip of triangular decoration at the left side. Surrounding the medallion is a scalloped frame with round arches and five-part rounded finials. Around the outer edge of the paten is an engraved Syriac inscription: "Hasnon, son of the deceased Habel from Edessa, has bequeathed this paten to the church of Mar Sergios in Resafa. Everyone who reads this, may wish to pray for the donor."[360] This inscription is clearly engraved from a tracing and was added after the fact to this paten.

The Lamp: The lamp[361] (Fig. 48) is designed in the form of a bowl with vertical sides and three loops for a chain above, and a steep nearly vertical foot with a rounded lip at the bottom. It is decorated with four medallions featuring embossed animal motifs in low relief repoussé work: two with paired and seated quadrupeds, two with a large bird attacking a similar bird of nearly equal size from above, pecking at its head. The medallions are framed with twisted ropelike borders that join with the upper and lower borders of the side panel of the lamp bowl. In the interstices we find pairs of designs, two of vinescrolls, and two of human-headed hybrid animals set against a vine-scroll background. On the curve joining the vertical sides of the bowl and the foot of the vessel, is a frieze with a series of eight running quadrupeds, including dogs and rabbits with other animals, set against a vine-scroll motif. Both the interstices and the lower frieze are similar in technique, with the niello forming the background and the animal and floral designs in reserve silver, an elegant design.

The lamp has no inscription, and although it may have been used for religious purposes, in many ways this work is the most problematic of those found in this hoard. Not only is its function less specific, in that it could be used for both secular and religious occasions, but also its place of origin is less clear. In fact,



46. The Chalice Foot. (photo: by courtesy of Tilo Ulbert, German Archaeological Institute, Resafa-Archiv)

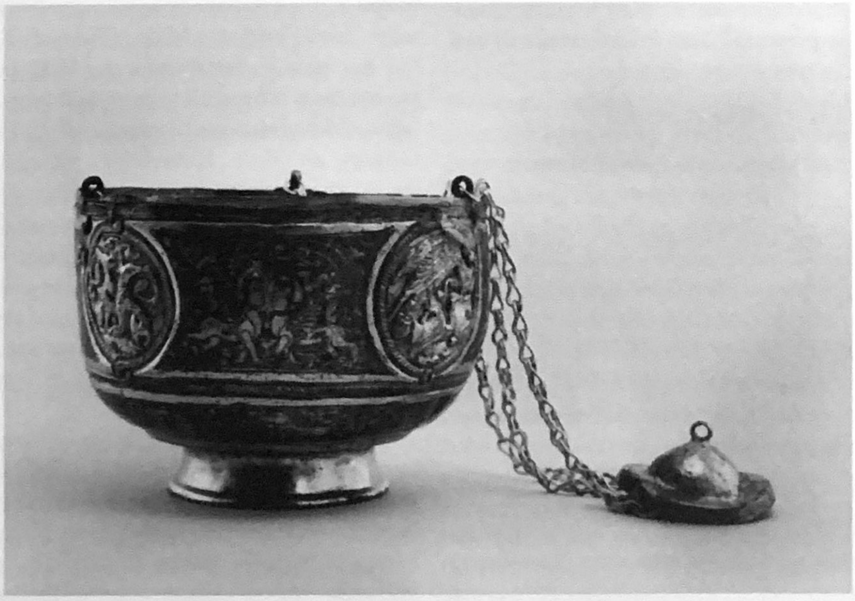


47. The Paten. (photo: by courtesy of Tilo Ulbert, German Archaeological Institute, Resafa-Archiv)

it was probably made in the Near East and is not from the West. Obviously nothing about the decoration is religious in nature, and there is no inscription to designate its use. The object could have been used as a hanging lamp in the Church of St. Sergios in Resafa, but the manufacture of this work appears to have been purely Islamic in nature, indeed a handsome example.

Taken together, this hoard of silver is a remarkable indication of the multicultural richness of the Crusader East, and the metalwork demonstrates high levels of quality on the part of western European, Syriac, Byzantine, and Muslim metalworkers. There is, of course, no way to know how these works came together, but we might envision a scenario something like the following. The Western pieces, that is, the two chalices, and the paten on the one hand and the wappenpokal on the other, came on the market in a Crusader city for some reason. Perhaps the owners died during the Third Crusade, or possibly the liturgical silver was part of the treasures sold after the fall of Jerusalem. In any case, one or more Orthodox Syrian found them available and had them personalized with new inscriptions in Syriac and in some cases given additional decoration. Eventually these works were given to the Church of St. Sergios in Resafa, along with the Muslim work acquired perhaps in Damascus, where it might have been produced in imitation of earlier Islamic Damascene work. The scenario for the secular bowl with heraldry might obviously be somewhat different, but again it becomes part of the church treasure as something special and valuable.

The existence of silver works that originate in the West and which have been "Easternized" in terms of inscriptions, and perhaps also with regard to certain engraved decoration, is



48. The Censer. (photo: by courtesy of Tilo Ulbert, German Archaeological Institute, Resafa-Archiv) worth noting for various reasons. They give testimony to the fact that religious observance and commerce crossed political and military lines in the Near East during the Crusader period, even here shortly after the reestablishment of the Latin Kingdom of Jerusalem following the Third Crusade. They demonstrate that Orthodox Christians were willing and able to use Latin Christian liturgical silver, in the same way that the Crusaders were interested in acquiring and utilizing Orthodox religious objects, ranging from icons to metalwork. They show that when even Western secular objects such as the wappenpokal came into Eastern hands, possibly as the result of a death or a capture or a ransom, such objects could be valued for their inherent worth and quality, even in a religious setting. Finally, it is intriguing to see that sacred and secular works from both Christian and Muslim origins could be combined in a context such as the one we find here at Resafa. We are stimulated to think about and ponder the variety of such treasuries that may have existed, the possible richness of their contents, the extent to which the multicultural ensemble of such a hoard could be representative of both a Crusader church or lord, an Eastern Christian church or lord, or even, conceiveably, a Muslim religious or secular treasure.

Manuscripts and Manuscript Painting

It is difficult to construct a picture of illuminated manuscript production in the Crusader States in the period 1192–1210. Because of the assumed shift of what has been identified as the scriptorium of the Holy Sepulcher in Jerusalem to Acre after 1191, because of the continuous destruction suffered by the cities in the Latin Kingdom not to mention the war raging over the Antiochene succession in the north, and most especially because we have so few extant manuscripts as yet identified to consider, our knowledge of manuscript illustration in particular is limited and fragmentary. We have nonetheless one inventory of codices possibly held in a Crusader library, and one extant illustrated codex.

The inventory appears in a manuscript now in the Stadtbücherei in Erfurt, where it is marked MS Q 102.[362] This codex dates *c.*1200 and contains on fol. 162v a listing of authors and works that is presented here, edited, selected, and organized by topics:

> Hii sunt libri conventus Nazarene ecclesie.

There are a number of Gospel and New Testament texts listed:

> Textus iiii Evangeliorum,
> Textus Marci evangeliste, also Matheus, Iohannes, apocalypsis Iohannis,
> Epistole Pauli glosate.

There are a large number of treatises and commentaries by the Fathers:

> Ambrosius[363] super Lucam, Augustinus de Trinitate, super Iohannem et glosule super Iohannem,

and numerous other treatises; one of the works by St. Augustine is listed as having belonged to the Bishop of Sidon:

> Eps. Sidonensis Augustinum de retractacione, Augustinum encheridion habet.

> Gregorius super ii libros Ezechielis, super Moralia Iob,

and other works,

> Ieronimus super psalterium,

and numerous other treatises,

> Isidorus de summo bono,

and other works.

There are works by Boethius:

> iii(es) Boetii cum glosulis; commenta Boetii.

There are books of works by and about the popes:

> Gesta pontificum,
> Duo libri canonum,

There are also secular books on science, history, and literature by a large number of classical authors:

> X libri de phisica,
> Duo libri de luna,
> Arithmetica,
> De Construcione,
> Eneis Virgilii,
> Lucanus cum glosulis,
> Iuvenalis duplex,
> ii(o) Oracii cum glosulis,
> Tullis de amicicia,
> ii(o) Stacii cum glosulis; duo Stacii Achilleidos,
> iii(es) Prudencii,
> ii Sedullii,
> Ovidius de Ponto; duo Ovidii epistolarum; Ovidius de amatoria arte; ii Ovidii stristium; ii O. de remedio amoris.

The Erfurt manuscript with this inventory on its final leaf was attributed to France in the nineteenth century,[364] and Beddie says, "neither the reference to *Nazarene ecclesie* nor to the books in the possession of the bishop of Sidon justify connecting the list certainly with Syria, but inasmuch as we apparently have no lists of books from the crusading states, the possibility is interesting."[365] Since Beddie wrote his article, however, a number of illustrated manuscripts, including some of the types mentioned in this list, have been identified as produced in the Crusader States, lending additional plausibility to the notion that this list refers to Nazareth in the Holy Land. No explanation has yet been offered as to how and why this list appears in a book which contains a number of short treatises by Augustine, Gregory, and Bede. Nonetheless, we can provisionally accept the list on face value as referring to Nazareth in Galilee and regard it as an inventory of manuscripts in the library of the Crusader convent there at the end of the twelfth century, presumably the chapter library connected to the cathedral. This collection is notable as medium-sized and important, with strong holdings in patristics and classical authors comparable to good cathedral libraries one might find in France and Italy at this time.[366]

Is there any evidence that would correlate the existence of a library in Nazareth with scholarly activity there? In 1983 B. Z. Kedar published an important study on Gerard of Nazareth, a Carmelite hermit from Nazareth who appears to have also been the bishop of Laodicea (=Lattakia); *Geraldus laodicensis episcopus* is attested in the sources from 1140 to

1161.[367] Kedar lists five major works that Gerard of Nazareth authored while he was in the Holy Land and asks whether Gerard's familiarity with a number of patristic works means that he studied in Europe, like William of Tyre did. Kedar says, "not necessarily," because of the existence of the library at Nazareth. He continues, "it is reasonable to assume that the affluent shrine church of Nazareth, which owned land in Apulia... before 1158, had possessed already in Gerald's day many of the books listed in this catalogue, and that other well-endowed churches in the country had comparable libraries at their disposal.... Consequently, Gerard may well have found his sources in a library of the Latin East of the type documented by the Nazareth catalogue."[368]

Is it possible that any of the manuscripts in this inventory were painted or historiated? The list itself offers no indications that can help us answer that question. Nonetheless, among the books mentioned it is well known that many were often illuminated in the twelfth century, especially the Gospel books, the Apocalypse, and Gregory's *Moralia in Job*, among others. One would certainly expect that if this collection at Nazareth was comparable to chapter libraries at other cathedrals in the Crusader States, including the patriarchates of Jerusalem and Antioch, major archbishoprics including Tyre, and the other major holy site at Bethlehem, there would have been some illuminated codices in each one, not to mention handsomely decorated service books for each cathedral church. We have at least the missals and sacramentaries from the Church of the Holy Sepulcher as concrete evidence for the latter. For the existence of the library collections we should recall that William of Tyre exemplified a distinguished scholarly tradition during his years of work in Tyre and Jerusalem and further that a Christian scholarly tradition was established in the Holy Land long before the Crusaders arrived. It was, after all, in Bethlehem that Jerome had worked in the fourth century, establishing a scholarly tradition shared by other early Christian sites such as Caesarea as well.

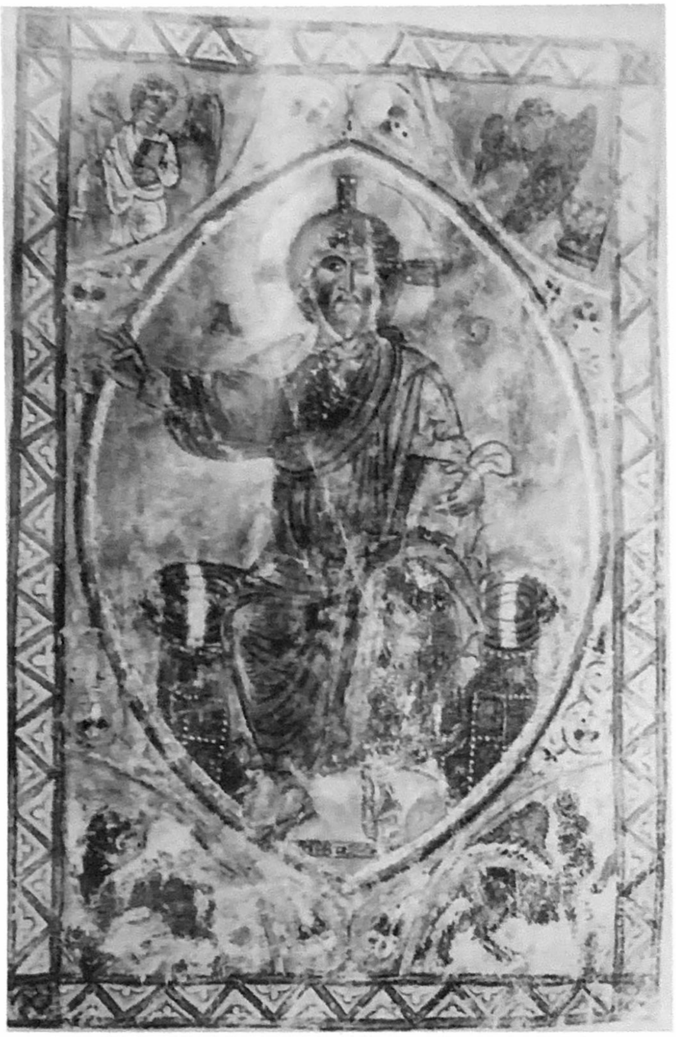
Given the possibilities the Erfurt list allows us to glimpse, it is frustrating to realize that we have only one extant illustrated manuscript, apparently newly produced in the Latin Kingdom at this time. Hugo Buchthal attributed one important manuscript to this period, an illustrated missal now in the Biblioteca Nazionale in Naples, MS VI.G.11[369] (Figs. 49 and 50, CD nos. 1–8). Unfortunately this manuscript is incomplete; there is no calendar at the beginning, and the litany and the sanctoral emphasize French saints, so there is little in the text that indicates this codex was produced for use in the Crusader States. In fact, were it not for the codicological characteristics of the book, the illuminated and historiated initials, and the panel miniatures, we would not be able to link this manuscript with the Crusader Kingdom. These paintings, however, make it abundantly clear that the artist who worked in this codex was working in the Holy Land. The question is, where was he working?

Buchthal pointed out that "the illuminated initials on a gold ground, most of them inserted in the same places as those in the Paris Missal and the Sacramentary divided between Rome and Cambridge,[370] are simplified imitations of them; and the two full-page miniatures, a Crucifixion [Fig. 49] and a *Maiestas Domini* [Fig. 50], may be taken to be equally faithful copies of the corresponding illustrations once contained in those two manuscripts."[371] The sacramentary and the missal probably date *c.*1130 for the former and *c.*1135 for the latter, that is just before and after the production of the Psalter of Queen Melisende, dated *c.*1135.[372] As such these three manuscripts represent some of the most outstanding work of the scriptorium of the Holy Sepulcher in the early phase of its extant work during the twelfth century.

Detailed comparison of the illuminated initials in the Naples Missal with those in the Paris Missal reveals the Naples manuscript is less lavishly decorated than its predecessor and that, whereas in the Paris manuscript a large proportion of the initials are historiated, in the Naples manuscript most are decorative, without human figures. Furthermore, the medium- and smaller-sized Paris initials have a striking colorism that features strong medium and light blues, pinks, and bright medium greens. In the Naples manuscript the hues and intensity of the colorism is completely different: for the smaller initials, they are mostly set on gold grounds with red borders, and the main colors are less intense pink and blue, medium green, and red. The larger initials in the Naples Missal have more



50. The Naples Missal, fol. 97r, *Maiestas Domini* (full-page miniature). (photo by courtesy of the Biblioteca Nazionale, Naples, and the Ministero per i Beni e le Attività Culturali)

comparable color schemes to those in the Paris Missal and the Rome Sacramentary: see, for example, on folios 97v[373] and 98r; one finds red, darker green, a dark medium blue and deep purple, all of which find certain parallels in the earlier manuscripts.

Basically the decorative repertoire of the initials in the Naples Missal is largely derivative from the earlier Jerusalem scriptorium manuscripts, as Buchthal pointed out.[374] We find innovation in only two instances: on folio 82v, the "E" for the start of the Easter *Exultet*, represents a disembodied hand with a green sleeve holding a round sacred vessel; on folio 98v, the "T" of the *Te igitur* for the canon of the Mass has the usual initial with flanking vine scrolls, but standing in front of the stem of the letter is a handsome tonsured bishop in a pink chasuble and a large golden pallium. Stylistically the Naples Missal painter is more closely related to the Italianate hand of the Rome/Cambridge Sacramentary than the Franco-Italian artist of the Paris Missal. The Naples Missal painter does not, however, share the same high level of refinement in design, the same characteristics of formal precision, or the excellence in overall quality of execution found in the two earlier manuscripts. He seems to be more provincial in background, probably Italian in origin, most likely from southern Italy, a Crusader painter working sixty-five or seventy years later, but still reflecting traditions of the Crusader scriptorium of the Holy Sepulcher seen in the Psalter of Queen Melisende, and other manuscripts closely associated with it.[375]

The main contribution the Naples Missal provides to enhance our view of Crusader painting is found in the figural miniatures preserved in this codex. On folio 96v is a full-page miniature of the Crucifixion. Although simplified and more monumental than the comparable image in the Melisende Psalter, it also draws on it for the poses of Mary and St. John from the earlier image and the loincloth of Christ; given an unusual pink and light blue-green border and centerfold colorism, it is also related in design. Simplification is seen in almost every component, from the reduction in the number of persons, to the smaller versions of the mourning angels, to the loss of shading on the cross. What is new and different is the remarkable color scheme for the border, pink semicircles on a greenish ground with light blue borders and red square corners. The somewhat garish taste in color is echoed in the other full-page miniature of the *Maestas Domini* on folio 97r.

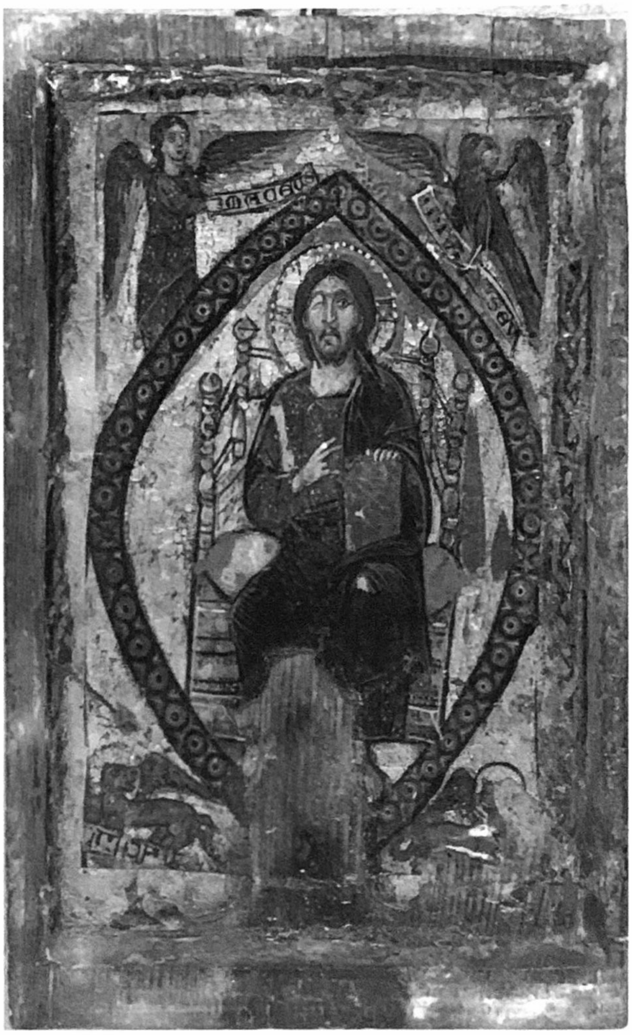
The *Maestas Domini* is framed with alternating gray-blue and pink triangles inside a gray-green rectangular border with red square corners.[376] Inside, on a gold ground, a handsome, swarthy Christ with glancing eyes is seated, dressed in brown with a dark blue cloak, on a jeweled throne with a red and white cushion. He is blessing in the Greek manner with his right arm outstretched, and holding with his left hand a book upright, behind which a tail of drapery appears. His mandorla cuts off the throne and his footstool, which his right foot nonetheless overlaps. His pink and gray-green mandorla and a set of quartercircular segments separate him from the four apocalyptic symbols in the corners: the winged man and the eagle above, the winged lion and the winged ox below, all holding closed books. The bodies of all of these figures face away from Christ, but they look back toward him. Despite the fact that the two early Jerusalem service books now in Paris and in Rome/Cambridge also apparently had images of the Crucifixion and the *Maestas Domini*, this miniature of the Christ in majesty is the earliest Crusader one to survive. It is an impressive work, the finest image in this codex, with a decorative repertoire that also relates it to the earlier Jerusalem manuscripts.

Were we limited to these *comparanda*, the Naples Missal would present no new problems, and we could accept Buchthal's attribution to Acre *c.*1200 without further comment. But in fact other related paintings raise some difficult questions. Besides the earlier Jerusalem manuscripts, the Naples Missal is also related to the Bible now in San Daniele del Friuli. Whereas the San Danieli Bible is an ambitious work of the highest quality, done with an extraordinary decorative flair, a refined Italo-Byzantine Crusader figure style, and an incredibly rich color scheme, it has not yet been firmly dated or located. Although I have argued recently that it may date in the 1180s and was most probably executed in Antioch, the questions of its date and place of origin remain unresolved.[377]

The Naples Missal relates to the San Danieli Bible in a number of ways. The rich color scheme in the Naples Missal is a reflection of similar interests found in the San Danieli Bible on a much higher, diverse, and more intensive level. The figure style in both manuscripts is a Crusader version of the Italo-Byzantine formal approach seen in Sicily, but again much more refined in the Bible than in the missal. The decorative repertoire and the handling of the large initials in the San Danieli Bible are also reflected in the missal. Comparing the design of the large "P"s in the Bible, on folios 35r, 236v, for example, with the "P" on folio 97v of the missal, one finds a variety of similarities: the segmented structure; the similar interlace at the top of the stem with animal heads biting the upper curving element of the letter; the paneled components of the stem and curving element; the imaginative transformation of the curve of the upper portion of the "P" into an anthropomorphic, animal, or foliate design; and the gold on which the initial "floats" inside its deep purple setting. One is also struck with the rustic character of the missal initial in contrast to the exquisite quality of the Bible initials, a contrast that is found throughout these two manuscripts point by point. What can this comparison tell us about Crusader painting at this time?

If we hypothesize that the function of this missal was to resupply an unknown church in Acre with a service book that was needed to replace the heavy losses following the fall, siege, and reconquest of Acre in 1189–91, the likelihood was that the manuscript was done in Acre where the scriptorium of the Holy Sepulcher had been transferred after the Third Crusade. Certainly the Naples Missal is more closely linked to earlier Jerusalem codices than to the San Danieli Bible, bearing out the Jerusalem scriptorium connection. But the San Danieli Bible seems to reflect on a higher level of quality the contemporary interest in a distinctive colorism, complex and monumental decorative forms, and the Italo-Byzantine Crusader figure style found also in the missal. Although it does not seem plausible that the artist of the missal would have necessarily worked in Antioch, or wherever the Bible was done, it is possible that the former knew the latter work or some other work very similar to it.

Proposing this artistic comparison may be no more significant than observing that in the political realm, the king of Jerusalem closely monitored affairs in the principality of Antioch and occasionally journeyed north to participate in events when necessary. If we can imagine that the San Danieli Bible existed in a church treasury in Antioch in the 1190s, however, it is noteworthy that such a high quality work of art was there, that artists might have had occasion to see it, perhaps in the cathedral or one of the other major churches in the city, and that there were artistic ideas exchanged between Antioch and Jerusalem in these otherwise often difficult times. We know of other works from Antioch, directly or indirectly, but, it must be said, surprisingly few given the importance of the city for the Crusaders. This would be one of the few cases we have, however, in which the artistic ideas embodied in a work from Antioch towered over a much more modest work from Acre or Jerusalem. In terms of this comparison, we can certainly say that, if the San Danieli Bible was done in Antioch as I am arguing, it demonstrates that Antioch could reach high levels of quality in production hitherto seen only in Jerusalem and not yet seen in Acre.



51. Icon: Sinai, App. no. 34/308, Maestas Domini. (photo reproduced by permission of Archbishop Damianos and the Fathers of the Monastery of St. Catherine, and by courtesy of the Michigan-Princeton-Alexandria Expedition to Mount Sinai). See Color Plate 1.

Painting: Panel Painting

The San Danieli Bible is not the only work which can be compared to the Naples Missal. It is interesting that one of the small icons now preserved in the collection of the Monastery of Saint Catherine's at Mount Sinai is devoted to an image of the *Maestas Domini* (Color Plate 1, Fig. 51, App. No. 34/308).[378] In fact, the sixth-century doors of the Church of St. Catherine in the monastery also carry a Limoges enamel plaque of the *Maestas Domini*, probably late twelfth-century and donated to the monastery by pilgrims from western Europe.[379] To what extent is the image of Christ in Majesty related to either of these works?

When Weitzmann first published the little *Maestas Domini* (Fig. 51, App. no. 34/308) from St. Catherine's, he noted the existence of the image in the missal but stated, "our icon is not based on this earlier miniature, which merely demonstrates that this typically Western subject was quite familiar in crusader art."[380]

He further characterized it as a work painted by a French artist from the second half of the thirteenth century.

Furthermore, its mediocre quality was to some extent directly related to its distance from any Byzantine models, as he saw it. Nonetheless, despite its relatively poor condition and its indifferent quality, it is a work of considerable interest for us here in relation to the Naples Missal.

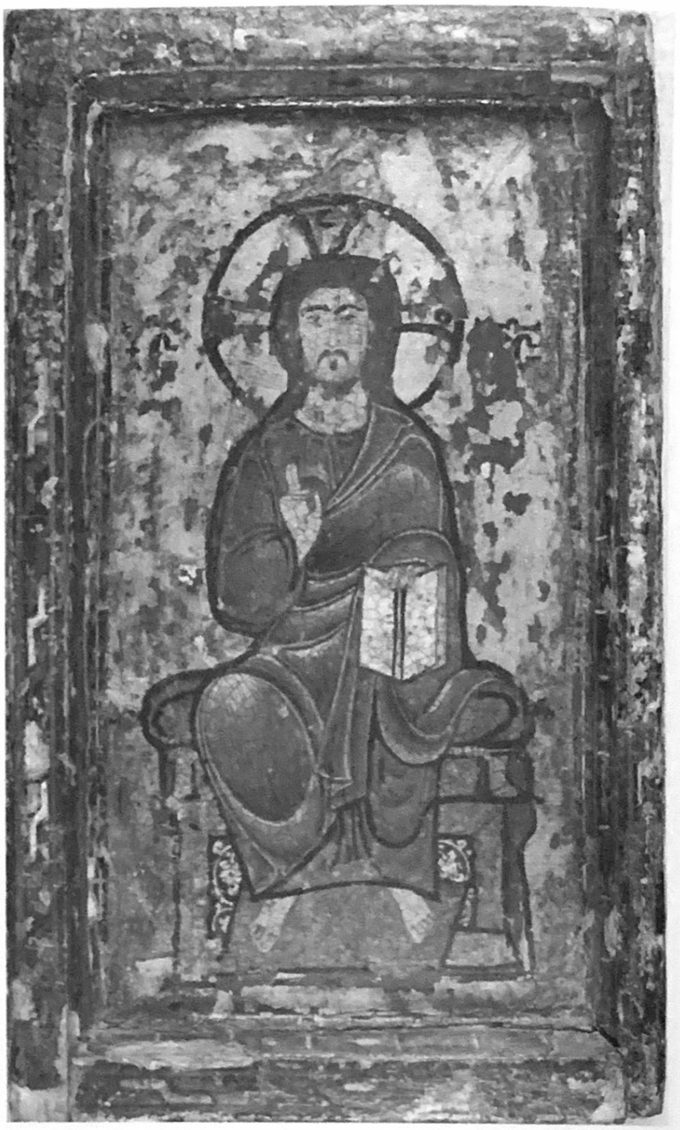
In the icon, the figure of the Lord wears a pinkish-purple tunic decorated with pearls and a blue robe highlighted with reddish chrysography and has a pearl studded halo. He sits enthroned holding a book and blessing in the Greek manner against a gold ground, inside an irregularly shaped pink and blue mandorla decorated with shaded circles separated by triangular shaped clusters of rays. The throne on which Christ sits is strikingly similar to a type found in the *Bible Moralisée* manuscripts done in Paris in the 1220s and 1230s. Outside the mandorla the four apocalyptic creatures appear. These include the winged man in the upper left, holding a scroll on which is written "MATEUS," and at the upper right the eagle with wings displayed holding a scroll with the letters "IOHANES EV." At the lower left is the winged lion, with a scroll carrying the letters, "MAR...," and at the lower right is the winged ox, which is heavily flaked away as is his scroll. Framing the image is a cable interlace design on the inner curved surface, which is fragmentary but visible along the upper left side, along the top (faintly), and especially along the middle part of the right side. The outer frame was apparently gilded, but it is so badly flaked that one cannot see what design, if any, it carried.

It is the interlace border of the icon especially that draws our attention to the panel in this time frame. In his publication of the icon, Weitzmann attributed the interlace border to "an older layer of paint which became visible only after the edges of the upper layer had begun to flake.... We cannot be sure, but it seems quite likely that the lower layer, probably from the twelfth century, also depicted a Christ enthroned, or perhaps a *Maestas Domini.*"[381] At the time of his publication, Weitzmann was thinking the interlace border dated the icon to the mid-twelfth century, based on a comparison between it and a similar border on the icon of the Enthroned Christ (Fig. 52, App. No. 76/1024). Nelson and Hunt, arguing independently and persuasively, have shown that the Enthroned Christ with its interlace border dates in fact to the first half of the thirteenth century and that the painter had a background in Coptic Christian painting.[382] It is quite possible, even likely, therefore, that the date of the lower layer of painting on the *Maestas Domini* icon should also be attributed to the years *c.*1200–25.

In his discussion of the Enthroned Christ icon, Nelson pointed out that the interlace design of the frame was quite popular and widespread, found on a number of Crusader, Syriac, and Coptic manuscript paintings.[383]

To this ensemble can be added now the arcades of standing saints in fresco paintings in the Qalamoun region of Syria, such as Qara, dating in the mid-thirteenth century, as well as the frescoes of the northwest room of the castle chapel at Marqab, dating *c.*1186–8.[384] Finally, to these examples should be added a variation on this type of border found in the Syriac Buchanan Bible done in northern Syria, near Edessa, in the early 1190s.[385]

It is notable that although the paint layer visible today for the main image on the Crusader icon is done in a French Gothic Crusader style and was therefore probably done somewhat later than our miniature, although just how much later is very much an issue to be resolved, the iconographic arrangement of the apocalyptic creatures in the icon corresponds to those in the manuscript image in terms of location around the figure of Christ. There are certain differences as well: the Naples Missal ensemble with the dominant Christ and the four creatures holding books in dramatic poses reflects the idea expressed in the Moissac tympanum in the early twelfth century. By contrast, the icon, despite the fact that the four creatures all hold scrolls, reflects the arrangement of the Chartres west tympanum in the mid-twelfth century with the upper two figures facing Christ, and the lower pair turning away with their heads looking back. But parallels to the appearance of the Alpha and the Omega as apocalyptic symbols in the miniature are found especially in Spain, in frescoes at Léon and Tahull in the twelfth century. These French and Spanish parallels are not cited to suggest there were any direct connections between Eastern painting and earlier Western sculpture or fresco painting, but only to indicate that some of the same variety in the diverse nuances found in the *Maestas Domini* iconography in the West can also be found

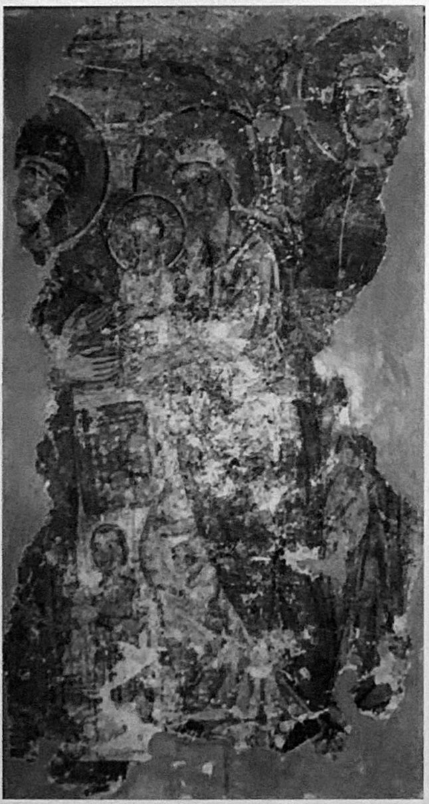


52. Icon: Sinai, App. no. 76/1024, Christ Enthroned. (photo reproduced by permission of Archbishop Damianos and the Fathers of the Monastery of St. Catherine, and by courtesy of the Michigan-Princeton-Alexandria Expedition to Mount Sinai)

here in the Crusader East. These examples suggest a rich development in the Crusader East; furthermore, these two exemplars of the *Maestas Domini* iconography, the missal image done in Acre and to be dated *c.*1200, the icon done at Mount Sinai and to be dated to *c.*1220–30,[386] give important evidence that this Western iconography was current in the Holy Land in more than one version in the first quarter of the thirteenth century. We may also wonder whether images of the Lord in Majesty might not have been found in the apses of Crusader churches that received programs of fresco painting at this time.[387]

Painting: Frescoes, Panel Painting, and Model Books

Just as with manuscript illumination, there are few survivals of fresco and panel painting in this period, although there is some important evidence. We have already referred to the existence of a fresco from Crac des Chevaliers representing the Presentation of Christ in the Temple that was executed at this time (Fig. 53). Its original location in the castle and the circumstances of its rediscovery are worthy of note. In 1954–5 a new program of repairs was initiated at Crac under the administration of the Syrian Antiquities Service, after the French mission directed by Paul Deschamps had left. G. Kalamkarian surpervised the removal of remains of a fragmentary Arab wall abutting the chapel in the Room of 120 Meters, adjacent to the chapel on the north side. A significant fresco painting was revealed behind the Arab masonry approximately 1.05 meters above the level of the floor. The fragment was left on the wall until the damp conditions in the castle required that it be removed. In 1965 the fresco was first exhibited in the church museum (the former Cathedral of Notre Dame) in Tortosa, where it can be seen today. The fresco fragment is 1.65 meters high × .92 meters wide.[388]

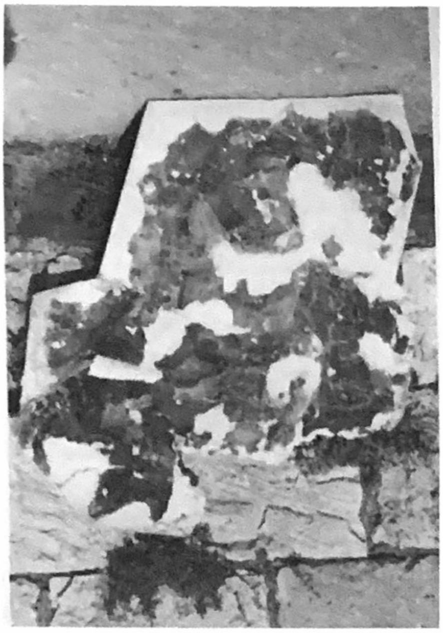


53. Crac des Chevaliers: Presentation of Christ in the Temple from the exterior north wall of the chapel, now in the Tartus Museum (= cathedral of Notre Dame, Tortosa).

The fresco is clearly a fragmentary scene of the Presentation of Christ in the Temple with five figures still visible. Four are identifiable: Mary, Simeon holding baby Jesus over an altar, and the prophetess Anna. Below the gesturing hands of the Virgin we also have a small beardless male figure in a tunic who is as yet unidentifiable; he is gesturing toward Mary. The figure of Joseph, now lost, would no doubt have originally appeared to the left of the very damaged and fragmentary figure of the Virgin Mary. Besides the altar, a simplified table covered with a white cloth on which appears what seems to be a jeweled book of holy scripture, one also finds the horizontal members of some sort of architectural structure above the heads of the main figures.

The unknown figure is distinct from the other four because he is smaller and stands in front of the platformlike ground on which they are located, and because there is an inscription above his head. The inscription in Latin letters appears to read "SisONIN," possibly meant to be a family name. The obvious idea that this might have been intended to be the name of a local saint, "Scs Onin," for example, is contravened by the fact that whereas the four holy figures above all have haloes, the standing male figure does not. In any case the letters of this inscription do not appear to have been painted by the same hand that painted the Greek inscription above, "IC" "XC," next to the halo of Jesus. It remains an open question whether this inscription was original at the time the figures were painted or if it may have been added later.[389]

The style of this work is clearly very simple and direct, even rustic, a charming interpretation of a stately Byzantine image from the *Dodekaorta*. Three possibilities may be entertained for the identification of the artist, who was clearly a talented local painter. Perhaps he may have been someone trained in painting from Acre, and even before that perhaps from Jerusalem before 1187. Possibly he was a monk, someone known to the Hospitallers from his work in Acre. In a less likely scenario, he may have been Syrian Orthodox from the immediate local region hired by the Hospitallers. Finally, he might have been a Hospitaller at Crac who was trained by Syrian Orthodox painters in this area.[390] Despite certain Western aspects in the work, most notably the generalized architectural setting, the youthful figure of Anna, and the direct eye contact between the main figures and the onlooker, there is no reason to believe the artist came from Europe. The strong impact of the Byzantine tradition is obviously important here, and a byzantinizing image of this scene must have served as a closely studied model for the painter. The source of the byzantinizing image may well have been one of the numerous Maronite or Orthodox monasteries or chapels in the region around Crac.[391] The fact that the artist has integrated certain western predilections of form and iconography so effectively along with the straightforward and calculated use of his byzantinizing source seems characteristic here at the start of the thirteenth century of a continuation of the Crusader approach found earlier in the twelfth century.[392] These features suggest that the painter could well have been a cleric, Hospitaller or otherwise, trained both in Acre and by the local Syrian Orthodox artists in the region.



54. Crac des Chevaliers: external chapel, Virgin *Hodegetria* with angel at the upper right, on an armature after removal from the chapel wall.

It seems unlikely, given the large size of this painting, that it was part of an ensemble with the Twelve Feast cycle as frequently found in Byzantine art. Rather it is more likely that, comparable to the selected scenes of the life of Christ found in the northwest room at Margat, the Presentation was chosen to be an individual image for a devotional chapel set up along the exterior wall of the castle chapel at Crac, inside the Room of 120 Meters. The exact nature and function of the chapel remains in doubt. It would be tempting to think that it might have been some kind of funerary chapel, in view of the sizeable burial site located just outside the west entrance to the chapel. The fact remains, however, that Deschamps did no excavation work in the Room of 120 Meters, and no burials are known to have been placed there or inside the chapel based on any other type of evidence. Furthermore, certainly the Presentation in the Temple is not a common choice of scene for burial chapels. Just why this image was appropriate here and whether the reference to the temple in Jerusalem was somehow relevant to the Hospitallers at Crac or to the (special?) donor at this moment remain open questions.

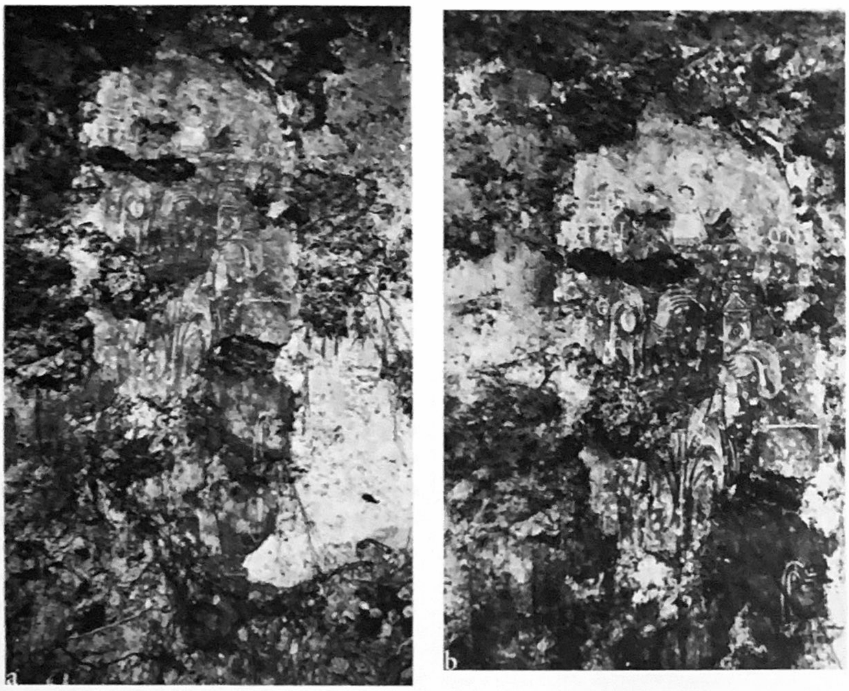
At this point we can propose three conclusions about the Presentation fresco at Crac des Chevaliers. First, it is the only surviving figural portion of a much larger ensemble of fresco painting for the chapel that apparently included the entire interior as well as the north wall exterior. Second, indications are that the program of fresco painting for the chapel here at Crac after 1202 was much more ambitious than the program started at Margat and left unfinished in the 1190s. Third, the presence of fresco painting executed during the years of tremendous architectural activity at both Crac and Margat clearly supports the observation made by Runciman that we quoted earlier, namely, that "if architecture flourished, it is likely that the other arts flourished also." What is truly significant here is that we see this dictum validated in terms of castle locations, not just urban centers, and it directs our attention to the increased importance of these castles for understanding Crusader art in the thirteenth century.

It is worth pointing out that there were other figural fresco paintings done at Crac, in a tiny chapel just outside the main entrance to the castle.[393] This chapel apparently existed for the local people associated with the fort who lived and worked in the land surrounding the castle. Some of these images, also very fragmentary, quite damaged, and recently restored, must have been done about the time of the first major earthquake at Crac, that is, *c.*1170, but some may have been done later, *c.*1202 and immediately following. A number of factors make evaluation of the stylistic variety of these paintings difficult: the poor condition of these paintings, the various layers of plaster on which they are found, and the fact that they have now all been removed from their original location and mounted on armatures. Furthermore, no archaeological information has been published on the little chapel. Nonetheless we can safely observe that none of the strongly Byzantine-inspired paintings in the chapel outside the castle, in particular, the images of the Virgin Hodegetria with angel to the right (Fig. 54) and the figure of St. Pantaleon (Fig. 55), appears to be by the hand of the artist working inside the castle on the Presentation scene (Fig. 53). Partly based on this comparison, I have suggested that these two images – the Virgin Hodegetria and St. Pantaleon – may have been the earliest of the group to be executed, possibly as early as the 1170s.

The dates of the other fresco fragments from the little chapel, all of which seem quite different in style, like the fragments of the scene with the horse of St. George (who is saving the youth of Mytilene), are more difficult to determine (Fig. 56). The St. George fragments, along with those of seated and standing figures, are quite boldly linear in design and appear to be simplified versions of twelfth-century work, but obviously these fragments have lost much of their original paint surface and have also been heavily restored. Nonetheless, the St. George's horse fragments at Crac compare favorably with the remains of those of St. Sergios and St. George at Mar Musa al-Habashi – not as the work of the same artist, but as examples of a similar local painting style from this region.[394] The fragment of the seated figure from the little chapel at Crac (Fig. 57) also shares similarities in the treatment of the drapery with seated figures in the Last Judgment at Mar Musa.[395] They and the other fragments of seated and standing figures could well have been done slightly later, shortly after 1202 when the work inside the castle chapel was completed.

The paintings in the external chapel at Crac along with the Presentation scene from inside the castle, and the two scenes in the northwest room at Margat, enable us to propose an additional important conclusion to our study. The primary evidence for painting in the region around Margat and Crac, apart from the castles, is the panel and fresco painting associated with Eastern Christian, that is, Maronite and Syrian Orthodox, monasteries, grottoes, and devotional chapels in Lebanon and Syria. The Eastern Christian artists working in the region seem to have provided the Hospitallers at Crac, and possibly also at Margat, with material to study, and also, quite likely, with training for the painters working on the castles.

Finally, it is clear that there was impressive fresco painting activity at Crac des Chevaliers on a variety of levels. If so many

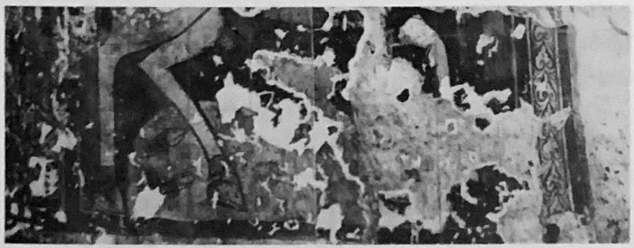


55. Crac des Chevaliers: external chapel, St. Pantaleon, a. in situ before removal from the chapel wall, b. on an armature after removal from the chapel wall.

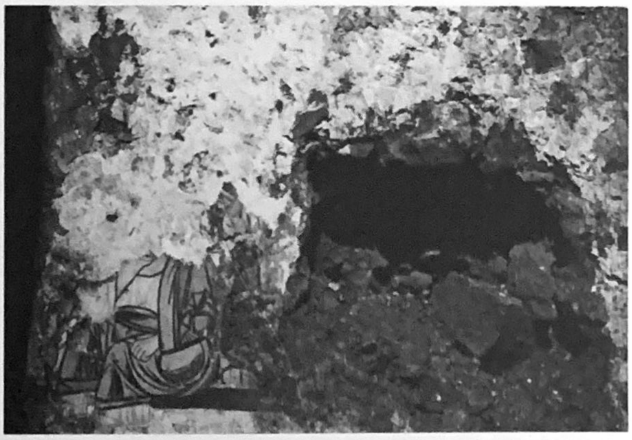
images could have been done in the little chapel for the workers outside the walls, we are certainly entitled to expect substantial work for the garrison inside the castle. Although no fragments have been found except in association with the castle chapel, it is not impossible that monumental painting may also have once decorated the great hall or the so-called logis du maitre.

The frescoes found at Margat and at Crac des Chevaliers are some of the most surprising evidence we have for Crusader artistic activity in these years. It is significant that these frescoes date primarily to the period after the Third Crusade, because extant monumental painting is not plentiful at any point except in Bethlehem in the 1160s. We shall have to await the appearance of further evidence to attempt more precise indications for dating and locations. Nonetheless, on the basis of these important finds at Crac and also the slightly earlier fragments at Margat, every castle in the region of the three Crusader States requires a careful review for any possible evidence of as yet unrecognized fragments of additional fresco painting from the Crusader period. Every Crusader structure, ecclesiastical and domestic, in the three Crusader States needs to be scrutinized again, including the well-known church at Tortosa and all the buildings identifiably Crusader in Acre.

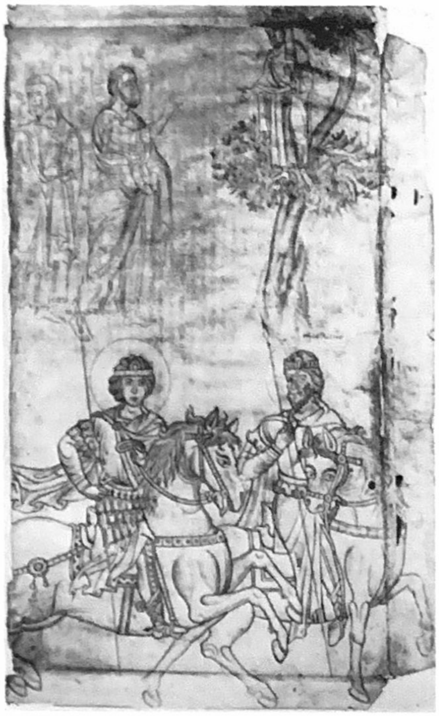
The Freiburg Leaf: The evidence in regard to panel paintings is more indirect, and there is possibly additional indirect evidence for monumental paintings as well. At the moment we have no complete panel paintings extant from and convincingly attributed to 1192–1210.[396] What we do have is the Freiburg Leaf, a manuscript fragment with one folio containing two drawings, both of which are important for our knowledge of the development of Crusader painting in this period[397] (Fig. 58, CD nos. 9–14). Kitzinger proposed that the Freiburg Leaf was an example of a motif book in which an artist collected sketches



56. Crac des Chevaliers: external chapel, St. George and the youth of Mitylene (fragment of the horse, in situ before removal from the chapel wall).



57. Crac des Chevaliers: external chapel, Seated Figure, in situ before removal from the chapel wall.



58. Stadt Freiburg im Breisgau Kulturamt: Augustinermuseum, inv. no. G. 23: "The Freiburg Leaf": Christ and Zacchaeus, Sts. George and Theodore, fol. 1c, r. (photo by courtesy of the Augustinermuseum, Freiburg im Breisgau)

of images he observed during his travels.[398] Everyone seems to agree that the artist in question is a German from the Upper Rhineland who was traveling *c.*1200 when he executed these drawings. Demus suggested he was an Augustinian monk.[399] Everyone also agrees that the same artist was responsible for both drawings, but the models he used were different media in different locations.[400]

The upper register drawing in silverpoint depicts Christ speaking to Zacchaeus in a sycamore tree, an incident drawn from the Gospel of Luke 10: 1–19 (Fig. 58). Christ gestures to Zacchaeus standing in the sycamore tree in front of him, with Peter behind Christ looking back, presumably to other apostles who are lost where the vellum has been cut off at the left. The upper scene appears to have been drawn first because the red lance held by St. George in the lower scene overlaps the foot of Christ in the upper scene, and the lance of St. Theodore and his halo in the lower scene, the trunk of the sycamore tree above. The hindquarters of St. George's horse and the end of his flowing cloak are cut off by the loss of vellum at the left. Demus noted the strong similarity with monumental painting between the Christ-with-Peter-standing-behind-him group in the leaf and the Monreale mosaics, even though this particular scene does not appear at Monreale.[401] Weitzmann noted that the Monreale scenes were based on Byzantine manuscript cycles and proposed that the upper scene came from a late Comnenian miniature in Constantinople.[402]

The lower scene appears to have been based on an icon painting. The question is, what kind of icon? The inscriptions penned onto the leaf by a later hand only identify the two riders as a companion saint with Theodore,[403] just as they are indicated in the catalogue of scenes on folio 1a (recto) (CD no. 9). The two figures are surely the youthful, beardless St. George at the left and the bearded St. Theodore at the right, a typical Byzantine pairing.[404] On the other hand, the idea of mounted soldier saints, although not unknown in Byzantium,[405] was of particular interest to Crusader artists in the thirteenth century.[406] Furthermore, although the figure of St. George is dressed in recognizeable Byzantine military costume, the figure of St. Theodore appears to be wearing Crusader dress with a long tunic reaching all the way down to his ankles. Both mounted soldiers also wear a diadem, a frequent feature in Crusader iconography of these mounted saints.

It is clear that the style of the two drawings is somewhat different, just as the techniques used are distinct. The upper silverpoint drawing is refined with sensitive attention to the soft draperies flowing over the figures, the naturalistic tree, and the gently shaded components. The lower sepia drawing is more decisive with bold linear definition, strongly stated patterns in the armor, horses' manes, the tack, and the draperies. Nonetheless, the artist's conventions are the same in both drawings, for example, in the rendering of the faces, demonstrating that this is the same person employing different models. What might those models have been, and where were they?

Because of the special features of the lower drawing, referencing characteristics of Crusader painting, Weitzmann proposed that the artist had "recourse to a Crusader icon as a model" and that he "travelled to the Holy Land, where, in the established Crusader ateliers, he must have been exposed to a great variety of copies from Byzantine models."[407]

In light of this hypothesis, the fact that we have almost no Crusader icons that have been securely dated to this period (1192–1210) suggests one of three possibilities: few were made; of the ones produced, few survived from this early time; or some of the icons currently dated 1250–91 should perhaps be dated earlier.[408] In any case, the lower drawing of the Freiburg Leaf clearly indicates, indirectly of course, that such icons did exist.

Where might the artist have traveled to see "established Crusader ateliers"? The most likely place is, of course, Acre, where we know that most major Crusader establishments from Jerusalem, including the patriarch of Jerusalem and his clergy, and no doubt his scriptorum from the Church of the Holy Sepulcher, relocated after the port city was taken by the Third Crusade in 1191. The obvious and most likely reason for this artist to have been in the Holy Land is that he came with the German Crusaders in 1197–8, and he could perhaps have stayed in the Holy Land for a while after most of the Crusaders went home. His sojourn in Acre could well have been facilitated by the newly established house of the Teutonic Knights that appeared in Acre at the time of the Third Crusade and opened formally in 1198 at the end of the German Crusade. The order itself was confirmed by a papal bull on 19 February 1199.[409] What light might all of this shed on the drawings in the upper register?

The episode of Christ and Zacchaeus appears relatively rarely in Western medieval art. The Gospels of St. Augustine (Corpus Christi College, Cambridge, MS 286) has a tiny version on the lower right side of the throne of St. Luke, from the early medieval period, and there are one or two examples in twelfth- and thirteenth-century German manuscript illumination, but none of these compares closely to the example in the Freiburg Leaf.[410] There is also an image in the mosaics of San Marco in

Venice.[411] Demus thinks it may have been based on a Byzantine manuscript model, but again it does not compare closely to the Freiburg example where the costume of Zacchaeus and his full-length representation standing in a tuft of leaves on the tree is distinctive. Perhaps, in light of these facts and the clear indication that the artist was traveling in the Levant based on the evidence of the lower drawing, he saw an image of Christ and Zacchaeus in the Holy Land.

Could he have visited Jericho itself where the incident took place and the house of Zacchaeus was located? Even though Jericho was no longer in Crusader hands in 1197–8, determined pilgrims were still able to visit the holy places by making special arrangements during these years. Jericho is not far from Jerusalem and is obviously an important site to be visited when visiting the place where Jesus was baptized in the Jordan River. A number of contemporary pilgrims' accounts refer to Zacchaeus in relation to Jericho,[412] and Abbot Daniel at the start of the twelfth century comments, "Jericho was formerly a great and very strong city . . . now there is just a Saracen village here. And here is the house of Zacchaeus and to this day there stands the stump of that tree on which he climbed to see Jesus."[413] The sycamore tree represented here is quite naturalistic and impressive, not the bush-tree seen in the San Marco mosaic or the abstract decorative version seen in German manuscripts. I propose the idea that the artist of the Freiburg Leaf not only saw a tree like this associated with the House of Zacchaeus, but also may have seen some kind of fresco in the House of Zacchaeus commemorating the meeting with Jesus. Certainly we know of other such fresco paintings not far away (e.g., in Bethphage)[414] along the route from Jerusalem to Jericho.[415] In sum, it appears that the Freiburg Leaf reflects a monumental painting, that the painting may well have existed in the Holy Land in Jericho, and, if so, it may therefore be the sole evidence we have for the existence of such an image in the House of Zacchaeus in the last years of the 1190s following the German Crusade. If indeed pilgrim access was facilitated to the holy places in Muslim control by the treaty of 1198, the artist of the Freiburg Leaf might well have visited Jericho at that time before returning home.

As I noted earlier, the image of the two soldier saints in the lower register overlaps the scene of Christ and Zacchaeus in the upper register. This suggests that the Christ and Zacchaeus image was drawn first, followed by the two mounted saints. Following my argument, this would suggest that the artist visited Jericho and drew the Christ and Zacchaeus scene, then encountered the icon he used as his model for the two soldier saints, later, presumably in Acre, after he returned to the coast. How does this pair of scenes fit into the sequence of images recorded in the contents for this Musterbuch, on what is now folio 1a (recto)?

The images or scenes listed on folio 1a (recto) above and below the two for which the surviving drawings provide the illustrations, are as follows:

68 Maiestas, deorsum benedicens.
69 Ubi ligatis manibus dominus ad passionem ducitur.
70 Ubi dominus inter duos latrones crucifixus.
71 Ubi apostolis dominus pedes abluit.
72 Suscitacio uidue.
73 Ubi maria domino in conuiuio pedes rigat.
74 Ubi Zacheus in arbore.
75 Theodorus equitans cum alio.
76 Dominus conculcat leonem, et draconem.[416]

This excerpt from the list is intriguing because it gives us an indication of a whole series of scenes, mostly having to do with Christ and the New Testament, that lead up to the images in the two drawings.

Starting with the *Maiestas*, such as we have been discussing in the Naples Missal and on the related Sinai icon (Fig. 51, App. no. 34/308), there is not any particular location we could necessarily place the artist when working on this image. Consider the following scenes, however: where Christ has his hands tied to be led to his Passion (in Gethsemane in Jerusalem, John 18: 12), where Jesus is crucified between two thieves (on Golgotha in Jerusalem, Matthew/Mark/Luke), where Christ washes the feet of his apostles (in the upper room on Mount Sion in Jerusalem, John 13: 1–20), where Peter revives Tabitha (in her home in Jaffa, Acts 9: 36–42), and where Mary anointed the feet of Christ at dinner (in the house of Simon in Bethany, John 12: 2–11). These are all events of the life of Christ that the artist could presumably have visited in Jerusalem and nearby the Holy City.

If on the basis of this series of scenes we attempt to construct an itinerary for our artist, the sequence would be as follows: Jerusalem (scenes 69–71), Jaffa (scene 72), Bethany (scene 73), Jericho (scene 74), and Acre (scene 75). It is admittedly a bit odd that the artist might have gone from Jerusalem to Jaffa before going to Bethany and to Jericho; however, he may not have drawn the scenes in the exact order he visited them, but rather grouped them together and drawn them where there was a workable space on his parchments. Certainly it is feasible and reasonable to understand the sequence of sites visited in Jerusalem (scenes 69–71) as the result of a pilgrim's route through the city, from Gethsemane in the Valley of Jehosaphat, up into the city to the Church of the Holy Sepulcher, and then south across the city out through the Sion Gate to the Church of St. Mary Mount Sion where the coenaculum could be visited.

There is one additional consideration that would make it quite expectable that the artist would be visiting these sites. If indeed he is an Augustinian monk as Demus suggested, we should recall that Augustinians were in charge of most of the holy sites in Jerusalem during the twelfth century. Even if they had been forced to leave Jerusalem at the time of Saladin's conquest in 1187 and move to Acre in 1191, the Augustinian presence would have remained strong in the Latin Kingdom. Albert of Vercelli, the new patriarch of Jerusalem a few years after our artist was in Acre, in 1206, had been trained as an Austin canon, for example. Augustinian interest in the holy places that they had been forced to abandon would have remained high. If this artist was visiting these holy places and sketching interesting works of art he saw in some of them, he would also be reporting to his colleagues what he saw during his travels to Jerusalem and the environs.

We may reasonably assume as others have done that each of the titles in the list referred to a scene which the artist drew in his model book, based on the correspondence between the listings for scenes 74 and 75 on folio 1a (recto) and the extant drawings on folio 1c (recto). We may also propose, based on our earlier discussion, that each of these drawings was in some way inspired by the site where the event was said to have taken place. We do not know whether there was a fresco painting of each scene at each site, but given the Crusader tradition of depicting the events of the holy sites in some medium, either in wall painting, in panel painting, or even in sculpture, it seems likely that there was some kind of image to be found in each place. Therefore, the artist may well have made at least seven sketches based on sites he visited in the Holy Land for his model book, of which only two drawings remain.[417]

Finally I might observe that whereas we imagine that the fresco in Jericho from which the sketch in the Freiburg Leaf was done probably was to be dated in the twelfth century, before 1187, as suggested earlier, and whereas we know that many congregations moved to Acre following Saladin's conquest, it nonetheless still seems likely that the German pilgrim who did the sketches on the Freiburg Leaf traveled to the places where the sites were located. First, we know that Christian pilgrims visited holy sites in Muslim held areas after 1187 (see the discussion of the pilgrims Thietmar and Wilbrand in Chapter 4). Second, the sequence of scenes listed on the Freiburg Leaf makes the most sense when derived from some kind of pilgrimage itinerary. Third, the fact that the artist uses two techniques for his drawings suggests he was working in different places when he did his preliminary sketches. Although I think it is possible he may have done the finished versions, as a silver point drawing and a pen drawing accented with touches of red, in Acre, the fact that these images are copying works done in different styles strongly suggests that he was standing in front of originals in separate places to start with.[418]

The Freiburg Leaf therefore turns out to be an unusually important work, providing indirect evidence not only for Crusader icon painting at this time, but also very likely for Crusader monumental painting as well. The Freiburg Leaf has additional significance in being a rare exemplar of an artist's sketch sheet, showing how an artist of considerable accomplishment used loose pieces of parchment to make visual notes on what he saw. The quality of the drawings is extraordinarily high, and it is our great good fortune that this work has survived, even in fragmentary condition, to help us understand more about the way knowledge of Crusader art was transmitted back to western Europe. It also suggests that pilgrim artists could have been active in this manner at other times during the Crusader period, of course. But it is interesting that at this time, *c.*1197–8, we have not previously thought of much Crusader art being done or even visible to the visiting pilgrim, and here is the Freiburg Leaf as a witness to important artistic work in the Crusader Kingdom that he was apparently able to see, but which is now mostly destroyed. Finally, the Freiburg Leaf is also important because it is one piece of evidence for a German presence in the Holy Land, a presence that is large and important in the military manpower of the Crusades from the time of Frederick I, especially between 1191 and 1244 and in terms of the Teutonic Knights, but is little identified as yet in the art.

Patronage

We have encountered evidence for a variety of patrons in our attempts to identify Crusader art in Syria-Palestine in 1192–1210. The patronage of kings and lords combined with that of major ecclesiastical figures certainly continues in terms of architecture and coinage, and no doubt manuscripts, although we have little to show for it. We also find a continuing and important presence of the Hospitallers as patrons especially at Crac des Chevaliers. We can only wonder what interesting work they were sponsoring at the Hospital in Acre, now that they had installed their headquarters there after the city was retaken by the Third Crusade. It appears that the patronage by pilgrims was reduced. Yet we can certainly identify Abbot Martin of Pairis as a pilgrim, and we can surely consider the artist of the Freiburg Leaf as probably a pilgrim who made interesting sketches along the way during his visit to the Holy Land. A potentially important new category of patron, however, emerges in the form of the confraternity. Just as we know confraternities later in Italy sponsored devotional imagery for their chapels in certain churches, we can surely expect that the confraternities that existed in Acre may have done the same for their membership.[419] Although we have as yet little in the way of extant material to associate with artistic patronage by Crusader confraternities, we shall look at all possibilities with great interest all through the years of the thirteenth century. It is evident that one possible source of sponsorship for the panel paintings we find identified as Crusader icons is found in these confraternities.

Conclusions

The picture of Crusader art and architecture that emerges in the years following the Third Crusade is fragmentary at best. What we can identify in architecture and in coinage is substantial and has not changed significantly in the last twenty-five years, although there have been important new studies on both, recently published or in progress. The situation in painting differs somewhat from the picture that we discussed earlier, in 1979.[420] There are a few more examples to consider, mainly by indirect evidence as we have seen. The Freiburg Leaf has emerged as a major new consideration here. The question of sculpture is still quite unresolved. No surely dated figural sculpture from the period 1192–1210 has yet been published, but it is not impossible that work from this period can eventually be identified from among the fragmentary survivals.[421] The issue of pottery and glass in these years is still not clear. Although there is relevant work attributed to the period of the late twelfth and early thirteenth centuries, there is comparatively little material that can be dated firmly in these years.[422] I attempt to address and discuss the issue of the Crusader pottery manufacture and commerce when we study the important site of Chastel Pelerin ('Atlit) in Chapter 4.

The turmoil in the Holy Land caused by the conquests of Saladin, the loss of the major holy sites to Muslim control, and the various Crusade expeditions between 1189 and 1210 apparently reduced the flow of pilgrims to the holy places substantially. The number of relics brought back or sent back to Europe by pilgrims is significantly reduced to the extent we can measure the flow.[423] There is no major pilgrimage account from these years with one special exception. The popular text on the "Estat de la Cité de Jerusalem" was produced sometime after 1187 and appears to have been continuously revised with some additions in later continuations of the Eracles in 1229, 1231, and later.[424] Nonetheless it fundamentally reflects the situation in the Holy City just before Saladin's conquest, with only glimpses after 1187. No other text appears to record the visit of an important traveler to the Holy Land in any detail until the account of Wilbrand of Oldenburg in 1212. This lack of pilgrimage accounts limits our access to what happened at the holy places in regard to artistic activity.

This does not mean that pilgrimage ceases, only that it is reduced and to some extent redirected. Pilgrimage tended to be conducted to sites that were held by the Crusaders or that were accessible to pilgrims under Crusader protection along with special arrangements including payments to the Muslims necessary to get to one of the major dominical sites. One of the sites that gains new prominence in the face of the difficulties facing the pilgrim in going to Jerusalem, Bethlehem, and Nazareth was Tortosa, and the shrine chapel of Notre Dame. Another site of growing importance was St. Catherine's at Mount Sinai. We have already found evidence of pilgrims visiting the shrine of the Virgin in Tortosa. We shall look carefully for specific pilgrimage links between the Crusader Kingdom and St. Catherine's in the years after 1210.

One of the phenomena about which we know the least was the relocation of organizations and institutions in the "new" Latin Kingdom reestablished with Acre as its capital after 1191. We know there were numerous clergy, regular canons, monks and nuns, not to mention members of the military orders, who were forced to leave Jerusalem and other inland sites during the dark days of 1187–8. But we know nothing about the main congregations responsible for the holy sites that were for the most part transferred to Acre after Jerusalem fell in 1187. How did they compensate for their "loss" of venue by decorating the church or monastery in their new location? What new work did they commission in Acre? What contact were they able to maintain with their original sites inland? Unfortunately we have little in the sources to enlighten us. Here again is another category of possible artistic work from which almost nothing survives.

Despite so little that we can identify as Crusader art in these years, the balance sheet here is nonetheless interesting. If we consider the admittedly sparse evidence that survives in terms of actual works of art, the surprising fact is that we have extant material indicated in all three Crusader States, that is, the Latin Kingdom, the County of Tripoli, and the Principality of Antioch. We also have a diversity of media that survives, ranging from coinage and metalwork, to manuscript illumination, panel and fresco painting, and military and ecclesiastical architecture. Although, with the possible exception of some of the sparse decorative sculpture at the Cathedral of Notre Dame in Tortosa, ecclesiastical architectural sculpture, as well as figural sculpture of any sort, conspicuously does not seem to survive; we would clearly know something about this, if the Church of the Holy Cross in Acre, in addition to other churches there or in Tyre, were extant.

Looking then at the overall picture we have, the fact of important artistic examples in so many major media, from such a wide range of locations, sponsored primarily by ecclesiastical patrons or members of the two major military orders, clearly indicates that important art and architecture were being commissioned. The importance of the military architecture and the coinage is perhaps primary in terms of the amount extant, the significance of what survives, and the fact that the architecture at least can be "seen" to be a major preoccupation in the written sources along with what has been identified in situ. In the examples found or for which there is evidence in each of the other media, however, a case can be made that this work was one of many and should not be seen as a single or even unique exemplar. We can only hope that as research continues, more works can and will be identified in this period that will help substantiate the picture that appears to be indicated. This may not change our evaluation that identifies military architecture and coinage to be the most widespread and important works of artistic activity at this time, but additional works that may come to light can help us balance a picture that now is sparse and dimly seen. What we clearly understand is that much art was lost or destroyed during these years, and we will find that the later destruction from 1219, 1244, 1265, 1268, 1289, and 1291 also took a terrible toll.

A number of questions remain. We have direct evidence for some artistic media, but obviously it is terribly fragmentary. We have indirect evidence as well, but there are great gaps. How important was the production of reliquaries and the shipment of relics to western Europe after the retaking of Acre by the Third Crusade? What Western works of art were shipped to the Crusader States to help replace those important liturgical objects destroyed or lost during the turmoil caused by destruction, successive Crusades, and the earthquake of 1202? What kind of luxury textile industry was there in the Crusader States in this period, and were liturgical vestments made in the Holy Land or were they shipped in from the West? What kind of diplomatic gifts were exchanged at the times of the Treaty of Jaffa in 1192 or the Treaties concluded between Aimery and the Sultan al-Adil in 1198 or 1204?[425] What impact did the apparent reduction of the numbers of pilgrims have on artistic production in the Crusader Kingdom and how would this affect artistic activity in the future? How did the experience of the resident Crusaders in the Holy Land, with their growing knowledge of Eastern Christian and even Muslim works of art, affect their artistic tastes and their commissions of new works? These remain open questions, the answers to which will greatly increase our understanding of artistic activity by the Crusaders between 1192 and 1210.

In sum, despite the lack of works of art that survive, despite the continuous destruction caused by successive military campaigns and Crusade expeditions, and despite the preoccupation of the written narrative sources with the political and military turmoil in this period in the Crusader States or the Fourth Crusade elsewhere, there was important artistic activity in the Latin Kingdom, the County of Tripoli, and the Principality in this period.

Because this work was so closely related to the military needs of the Crusaders during the years in question, there may have been a higher than usual rate of loss later on, but art and architecture continued between 1192 and 1210. It is not insignificant that the Crusader coinage indirectly expresses in its rather conservative imagery two themes of great importance for the Crusader States in these years. One theme is continuity, expressed in the coinage by the use of immobilized types which reflects the Crusader efforts to reestablish the Latin Kingdom after the Third Crusade on a firm footing by evoking coinage types of the Latin Kingdom before 1187. The other theme is architecture and especially fortification. The special Crusader interest in architectural imagery on their coins can clearly be seen in the Latin Kingdom well before 1187 in the deniers of Baldwin and Amalric. The expansion of the number of coins with architectural imagery after 1192 is notable and must reflect to some extent the preoccupation the Crusaders had for major architectural work at this time – on city walls, gates, and towers, on castles, on fortifications in general – in addition to other works, especially churches.

THE LATIN KINGDOM OF JERUSALEM: 1210–1225
THE CRUSADER STATES IN THE TIME OF KING JOHN OF BRIENNE AND THE FIFTH CRUSADE

THE LATIN KINGDOM OF JERUSALEM FROM 1210–1225: THE ADVENT OF KING JOHN OF BRIENNE, 1210–1225

John of Ibelin had ruled as regent for Queen Maria for five years in the Latin Kingdom when John of Brienne was finally chosen by King Philippe Auguste to be the next king of Jerusalem. Turning once again to Champagne for a Crusader leader, Philippe's choice seemed "disappointing."[1] John of Brienne, probably a young man of about thirty-five, and not approximately sixty as he has usually been regarded,[2] had served as a knight in the army of the French king without particular distinction, and he was not rich. Nonetheless, he proved to be intelligent; his first cousin was Walter of Montbéliard, who was regent for King Hugh I on Cyprus; and John came to this position with the financial and political support of both King Philippe and the pope. If, as the Eracles reports, he went east with three hundred knights, it must have been made possible by this support.[3] John of Brienne arrived in Acre and married Maria in the presence of Albert, patriarch of Jerusalem, in the Church of the Holy Cross, on 14 September, the Feast of the Exaltation of the Holy Cross. They journeyed then to Tyre where their coronation took place on 2 October 1210.[4]

John of Brienne was joined in the Latin Kingdom almost immediately by Walter of Montbéliard, who had recently left Cyprus now that Hugh I had come of age.[5] Walter was made constable of the Latin Kingdom. Two problems faced them immediately: first, the renewal of the last truce, which had expired, and second, the presence of Muslim forces in Galilee. Emir al-Mu'azzam, the son of al-Adil and a figure John of Brienne would have to reckon with continuously, had in fact raided the coastal plain around Acre during the coronation of the king in Tyre, and then retired inland. Later the Muslims erected a fort on Mount Tabor.[6] This was the first of several castles to be built in the hills east of Acre in the first half of the thirteenth century; most would be Crusader, but this one was not! At the same time as the castle at Mount Tabor was established, al-Mu'azzam was also refortifying the walls of Jerusalem.[7] Clearly the work on Jerusalem did not so much concern the Crusaders as a direct threat, but to offset the Muslim presence at Mount Tabor, only seven leagues (= approx. 28 km) from Acre, John sent an expedition under Walter of Montbéliard to the Nile Delta at Damietta. This was the third such Crusader raiding party to visit the Delta since 1204, and it indicates an increasing focus of Crusader interest in attacking Egypt. This raid reminded the Muslims of their vulnerability to such incursions, and it gave the Crusaders the opportunity to collect more information about the situation in the Delta. The Crusaders returned immediately to Acre. A larger Crusader force was about to be organized for a more serious expedition to the Nile Delta.

These skirmishes led to the opening of new negotiations for a truce. Although talks had been held in 1210 before John of Brienne came east, the Crusaders had not ratified the renewal, choosing to wait for their newly elected king to take charge. Now John of Brienne and al-Adil agreed on a new multiyear accord, which apparently began in 1211.[8] The Paris Eracles says that it was arranged as had been done previously, and was set at six years in duration.[9] At the same time that King John of Brienne was negotiating this truce in the Holy Land, he wrote to Pope Innocent III and asked for aid in the form of a new Crusade.[10]

From the time he became pope in 1198, Innocent III was known to be passionately dedicated to having a Crusade which would successfully regain Jerusalem and the holy sites.[11] Now, especially after the Fourth Crusade had come to such a destructive, unexpected, and untimely end, Innocent sought to organize a new expedition to the East. However, the year 1212 was a particularly difficult time. Spontaneous Crusade activity was intense and threatened to get somewhat out of control. Innocent himself had inaugurated official "Crusades" in the West: in the year 1208 he had called the Albigensian Crusade against the Cathars in Languedoc, a war which continued in the Toulousain region during 1211–13, but also the pope had called for a Crusade against the Muslims in Spain in 1212, leading to the great victory of Las Navas de Tolosa on 16 July 1212.[12]

FIFTH CRUSADE (1218-1221)

Map 3

There were also military operations sponsored by the papacy ongoing in the Baltic region carried out in the context of aiding the northern European missions to Livonia and Estonia.[13] In the midst of these developments there were also popular spontaneous Crusades, namely the so-called Children's Crusades in France and Germany in 1212, which although said to be aimed at the Holy Land, never left European ports.[14]

Just as the Fourth Crusade had become disorganized and fragmented between 1201 and 1204, Innocent was faced in 1212 with the problem of leadership and control. He needed to prioritize goals and consolidate legitimate Crusade movements simultaneously underway; to discourage popular, spontaneous Crusades; and to reconsider his policy for a Crusade to the East, in response to King John of Brienne's plea. The question was "how could the pope refocus the attention of Europe on a great Crusade to the Holy Land and rekindle the fervor that had surrounded the preaching of the First Crusade and, more recently, the Third and Fourth Crusades?"

Clearly Innocent III planned carefully for the Fifth Crusade, what would later also sometimes be called the Pelagian Crusade. Having decided on a new Crusade to the East, he sought to assemble a major council of the Church, what would become the Fourth Lateran Council in 1215. In the papal bull issued in April 1213 announcing the council, *Vineam domini*, he highlighted the two huge and ambitious goals of the council: first, the organization of a Crusade for the recovery of the Holy Land, and second, the reform of the universal Church.[15]

The encyclical, *Quia maior*, which accompanied the papal bull that announced the council in April 1213, emphasized the Crusade as a means of salvation for its participants. Innocent intended to inspire European Christians to take the Cross. However, he also was a pragmatist and having learned hard lessons from the Fourth Crusade and even from recent events in the Latin Kingdom and in Mediterranean shipping, he proclaims guidelines in detail and installs mandatory liturgical observances to focus attention on the spiritual importance of the cause:

> Because at this time there is a more compelling urgency than there has ever been before to help the Holy Land in her great need and because we hope that the aid sent to her will be greater than that which has ever reached her before, listen when, again taking up the old cry, we cry to you.[16]

Innocent goes on to describe and analyze in remarkable detail the specifics of the situation, providing impressive evidence for his up-to-date knowledge of conditions in the Holy Land. For example, he discusses the problem of Christians enslaved and imprisoned by the Muslims. He refers to the Muslim fort on Mount Tabor and the threat it poses to Acre. He is acutely aware of the problems that the Fourth Crusade encountered and he includes provisions to assure they are not repeated. He knows that his military projects in the West for the Albigensian Crusade and the Crusade in Spain could draw resources away from the new Crusade Near East, so he prioritizes the new venture and begins to scale down the privileges granted for the previously called campaigns, saying that their times of crisis had passed. He recognizes the damage pirates and their illegal profiteering in the resale of stolen goods in Mediterranean shipping did to the Crusade effort, and he declares that offenders would be excommunicated.

Finally he takes the unprecedented step of invoking specific liturgical observances to focus attention on the forthcoming Crusade.

> ... We decree and command that once a month there must be a general procession of men separately and, where it can be done, of women separately, praying with minds and bodies humbly disposed and with devout and fervent prayer, that merciful God will relieve us of this shameful disgrace by liberating from the hands of the pagans that land in which he accomplished the universal sacrament of our redemption...; with this wise proviso that during that procession the preaching of the cross which brings salvation should always be offered to the people in a way that is assiduous and encouraging.[17] Fasting and almsgiving should be joined to prayer,... And every day during the celebration of mass, when the moment has come after the Kiss of Peace when the saving sacrifice is to be offered for the sins of the world or is about to be consumed, everyone, men and women alike, must humbly prostrate themselves on the ground and the psalm [78] *Oh God, the heathens are come into thy inheritance* should be sung loudly by the clergy. When this has been ended reverently with this verse [Ps. 67], *Let God arise, and let his enemies be scattered: and let them that hate him flee from before his face*, the priest who is celebrating must chant this prayer over the altar: God, who disposes with his own blood and to restore it to Christian worship by mercifully directing in the way of eternal salvation the vows of the faithful here present all things with marvellous providence, we humbly beseech thee to snatch from the hands of the enemies of the cross the land which thine only-begotten son consecrated, made for its liberation, through the same Christ Our Lord... Amen."[18]

One might argue that the rhetorical force of the message might be vitiated by the details of legalistic analysis and proscriptions, but there is no doubt that Innocent has studied the situation quite carefully. In this document he is making every effort to start the Crusade off on the right foot, to set meaningful guidelines that will prevent the problems and diversions of the Fourth Crusade from recurring. He intends by enunciating high-minded ideals, by attention to all essential practical details, and by the power of intensive prayer, to give this new Crusade every chance of success.

While the recently signed truce was in effect, and the pope was thereby responding to the entreaty for assistance to the Holy Land, King John of Brienne was forced to deal with his own difficulties. In 1212 his new bride of only two years, Maria, died after giving birth to their daughter, yet another royal princess named Isabel.[19] The death of Maria made the infant Isabel II queen and immediately removed John of Brienne's right to rule as king.[20] The *Livre au Roi* stipulates that the royal blood passed through the female line.[21] In the eyes of her subjects John could only rule as regent for the baby princess.[22] Fortunately for John, as Isabel's father he was readily recognized as the logical and legal regent during her minority. However, later, when Isabel II married Emperor Frederick II in 1225, she truly would change the course of the history of the Kingdom.[23]

During this difficult time, John of Brienne lost the services of three of his most senior nobles, John of Ibelin,[24] his brother, Philip of Ibelin, and Balian of Sidon. John and Philip of Ibelin went to Cyprus to live and later appeared in the Fifth Crusade under the command of King Hugh. Balian of Sidon disappears from the sources until 1218. It appears these knights went into some kind of exile following an unexplained altercation with John of Brienne. However, they retained their fiefs so John was unable to build his power in the kingdom by appointing new vassals. It is unclear what the problem was that caused this disaffection, but Peter Edbury has proposed the plausible idea that the problem might have been an Ibelin-led challenge to John of Brienne's authority in 1213.[25] Whatever the reason, John of Brienne could ill afford to lose the services of three such major barons, all the more so if the Ibelin family harbored opposition to him in common with King Hugh I of Cyprus.

In an effort to strengthen his position, therefore, John of Brienne attempted to arrange an interesting diplomatic marriage for himself. He sought the hand of Princess Stephanie, daughter of King Levon II of Cilicia by his first wife. The marriage of John of Brienne and Stephanie took place in 1214 when John was in his early forties.[26] John of Brienne clearly hoped to inherit Cilicia eventually as a result. The *Chronique d'Ernoul* reports that King Levon II visited Acre after the wedding.[27] Certainly while King Levon II was alive, Frankish influence at the Armenian court was strong.[28] Furthermore Levon's links to the Hospitallers and even the Teutonic Knights were also important and he gave them certain castles, but he continued to contest the strategic castle of Baghras (Gaston) with the Templars. Nonetheless, when Levon II died in 1219, the Armenian barons rejected John of Brienne's claim, and Stephanie's death soon after, followed by that of their son, eliminated the possibility of him having any serious chance of pressing his interests.[29]

Fortunately for John of Brienne, the Latin Kingdom was basically at peace between 1212 and 1217, while he waited for the new Crusade to appear. The situation was not so peaceful in either Cyprus or Antioch, however. The pope was concerned that as preparations went forward for the new Crusade, all Christians in the Levant should end their differences. In 1213, he wrote to King Hugh, admonishing him about helping rebels against the authority of John of Brienne. Later, sometime in

1215 or 1216 he wrote both Hugh and Levon II, urging them to make peace with John of Brienne and to be ready to support the coming Crusade with needed ships.[30]

The situation in Antioch was much more volatile and problematic. As the conflict over the succession raged on, a schism developed in the Church, and King John eventually became much more directly involved through his marriage to Stephanie of Armenia.[31] After 1201, we have seen that Bohemond IV, count of Tripoli, had maintained his son's claim to Antioch in the face of Armenian interests, but the alliances constructed to hold on to power sometimes seem grotesque in their pairings, for example, Crusaders and Muslims as allies, and worse, they often divided the Crusaders against themselves. Bohemond was allied with the Templars, whose castle of Baghras Levon II, who was allied with the Hospitallers, refused to relinquish. Levon was more or less continually at war with the Seljuk Turks in these years, so Bohemond could dependably rely on az-Zahir, the prince of Aleppo, for support against the Armenian king. The pope himself even wrote to az-Zahir asking for his protection for the Latin patriarch of Antioch![32] Meanwhile al-Adil, sultan of Egypt, was expectably hostile to Bohemond.

In Antioch itself, there was a large and important Greek population that was no doubt intermarried to some extent with the resident Franks and who both – Greeks and Franks – supported Bohemond against the Armenians. At certain points Bohemond sought the support of the Greek majority in Antioch in various ways. He invited the Greeks to elect a new Orthodox patriarch, Symeon, when the papal legate suspended the Latin patriarch, Peter of Angoulême, from his duties. Even after a new Latin patriarch, Peter of Ivrea, received the pallium and arrived in Antioch in 1209, Symeon remained (1206–*c.*1212) until he was forced to seek refuge with Levon II sometime before 1213.[33] Later Bohemond even entered an alliance with Theodore Lascaris, emperor of Nicaea. Clearly Byzantium in its new fragmentary configuration after 1204 was seen as no threat to revive their old claims to Antioch, mainly because of the new Latin Empire in Constantinople.[34]

Repeated attempts by the patriarch of Jerusalem, Albert, to help solve the Antiochene succession and bring peace to the church in Antioch met with failure after 1208. In regard to the dispute over the succession, Albert was too closely identified with the Templars to have any credibility with the Armenians. In regard to the position of the new Latin patriarch of Antioch, Peter II of Ivrea, Albert's actions produced a schism between the Latin and the Orthodox churches by 1213.[35] Levon II meanwhile was skillfully playing off his overtures to Innocent III for Armenian church unification with Rome to maintain nominal papal support while he sought to advance Raymond-Roupen's cause. After two deaths at the hands of the Assassins, the first that of Raymond of Tripoli, Bohemond's IV's son, in 1213 – quite possibly with the collusion of the Hospitallers[36] – and the second that of the patriarch Albert, in 1214, the situation was in considerable turmoil. However, now the door was open for Levon to act when the opportunity presented itself. John of Brienne's marriage, of course, linked him directly with Levon II, who in February 1216 finally managed to occupy Antioch while Bohemond IV was away in Tripoli. Quickly, the rights of Raymond-Roupen, son of Raymond of Tripoli[37] and Alice of Armenia, and Levon II's great nephew and designated heir, as ruler of Antioch were pushed forward. Levon quickly seized the city of Antioch and had Raymond-Roupen consecrated as prince. The Antiochenes, exhausted by the seemingly interminable power struggle, supported their new leader. Bohemond IV, disenfranchised by the death of his son Raymond in 1213, had now been outflanked by Levon's persistence and skillful maneuvering.

Thus the succession was finally "solved," for the moment, at least until Levon's death in 1219. Peace was therefore more or less achieved in Antioch between 1216 and 1219, just as the new Crusade was actively being preached and organized in the West. However, dark clouds had appeared on the horizon for anyone who could see them. On the symbolic date of 15 July 1215, having just received the German crown in Aachen, Frederick II amazed everyone by taking the Cross. Who could have foreseen what an unique impact this strangest of all Crusaders would have on the Crusading cause, or the damage he would eventually do to the Latin Kingdom? A year later, on 16 July 1216, Innocent III died in Perugia. Thus, even while one of the Fifth Crusade's greatest preachers, Jacques de Vitry, was at work, the foremost champion of the Crusade movement since Urban II, Pope Innocent III, was taken from the stage. Meanwhile, locally in the Latin Kingdom Stephanie of Armenia had proven to be unpopular in Acre, and when she died in 1219, John of Brienne's claim to the throne of Armenia was eliminated. Thus for the second time in only seven years, John of Brienne had lost a wife and a royal claim in the Levant. But in the meantime duty called. He needed to be ready to receive the Crusaders arriving in Acre, to be available as a military leader to help shape the objectives of the new Crusade, members of which had been organizing for their departure since the Fourth Lateran Council in November 1215.[38]

JACQUES DE VITRY

Essential groundwork for this Crusade had been laid by the tireless and inspirational preaching of Jacques de Vitry, who became one of the truly major new ecclesiastical figures in the Crusader States, arriving in November 1216.[39] Jacques de Vitry had studied and taught at the University of Paris where he had known Fulk of Neuilly, the famous preacher of the Fourth Crusade. Jacques had started his crusading activities for Innocent III in 1211 when he preached against the Albigensians, after which he carried on with the preparations for the Fifth Crusade. Elected to the episcopal see of Acre, he was apparently present at the Fourth Lateran Council,[40] but was only consecrated bishop of Acre by Pope Honorius III in Rome on 31 July 1216, after the death of Innocent III. Following his consecration he traveled to Acre where he arrived on 4 November 1216.[41] In Acre he proved to be one of the most important clerical voices in the Latin Kingdom between 1216 and 1226, before he returned to the West. Not only did he join the Fifth Crusade between June 1218 and September 1221 and accompany the expedition to Egypt, but also he used his position in Acre to raise the profile of the Crusader cause in both the East and West.[42]

Jacques de Vitry is mentioned first as bishop of Acre, but foremost as a preacher, in the Paris Eracles and the Chronique d'Ernoul.[43]

Following his installation in Acre he set off on a trip up the coast to see the various Crusader cities and certain castles – Tyre, Sidon, Beirut, Tripoli, Tortosa, as well as Crac des Chevaliers, Chastel Blanc, and Margat – and to preach the Cross. He also visited one or two holy places; in particular, he mentions that he stopped at the Cathedral of Notre Dame in Tortosa, where he saw a special chapel in what was said to have been the first church built in honor of the Virgin Mary.[44] In this chapel, visited by Christian and Muslim pilgrims alike, he says he even baptized two Muslims. It was when he was in this region, visiting Tortosa and Margat, that word came from the patriarch of Jerusalem of the impending arrival of the first Crusader contingents, so he turned back south in order to be in Acre when they came.

The idea of preaching the Cross in the Crusader States was a new idea for this Crusade, one which had two benefits. It helped to prepare the resident Franks and other local Christians for the coming expedition. Many residents who had come from the West and settled here may have heard such preaching many long years earlier, but some born in the Latin East may not have ever heard it before. It also gave Jacques de Vitry the chance to see his new territory and for the residents to see and hear him and his message. Some of his sermons were written specifically to be delivered to Crusaders and to potential Crusaders, sermons which he gave in the West, on shipboard while en route to the East, and in the Levant. The message contained in these sermons was carefully constructed to articulate the call within the guidelines cited by the pope in *Quia maior*, making certain specific arguments to engage the will of the *crucesignati*-to-be, and citing appropriate biblical passages, especially from the Book of Revelations as well as the Old Testament.[45]

Jacques de Vitry's model sermons focus on Jerusalem and the Cross. In the first sermon, he wanted to inspire his listeners by stimulating outrage over the state of Jerusalem in Muslim hands in terms of the degradation this has caused to Christians there and to the holy places. By emphasizing Jerusalem's unique sacred role as the birthplace of the old and new faith, and as the center of the real and the ideal Christian world, he wanted to make a powerful claim that Christians had a moral obligation to take the Cross, an argument backed up by Old Testament prototypes from Eli to Samson and the Maccabees.[46] In the second sermon he focuses enthusiastically on the Cross: the Cross as symbolic, as protective, as redemptive. By his Crucifixion, Christ expressed his supreme love for sinful man. When we take the Cross, he argues, we respond to the Crucifixion by showing our love for Christ and for his mercy. In emphasizing the spiritual nature of the experience, Jacques furthermore specifies the indulgence:

> ...crusaders who enlist in the service of God and who are truly contrite and confessed, provided they die in Christ's service, are deemed to be true martyrs; they have been freed from venial and mortal sins and from every penance enjoined upon them; they have been absolved from the penalty due to sins in this world and from the penalty of purgatory in the next; they are secure from the torments of hell and are crowned with glory and honor in a state of eternal blessedness.[47]

Part of his message was also contained in the *exempla* he used in his sermons for a more mixed public to make points about moral conduct to his listeners.[48] Although we do not know exactly which stories he may have used in which locations during his preaching of the Cross in France or in the Holy Land in 1216, a few of the stories deal with Crusaders to the East,[49] and even with the Templars,[50] who are seen in an especially favorable light. Three mention specific sites in the Holy Land, namely, Acre, Tyre, and Ascalon.[51] One story even extols the virtue of Saladin.[52] The stories mostly show the Crusaders in a positive light, some even describing miracles surrounding the taking of the Cross or the heroism of a Crusader,[53] and were obviously appropriate for preaching the Cross with anecdotal material. Such stories outnumber those that might discourage people from taking the Cross, such as those telling of dishonest sailors, smiths, or innkeepers who preyed on pilgrims.[54] For Jacques at least, the religious idealism of the Crusade was still very strong. It is true that he acknowledged in a few stories the reality that there were those unscrupulous people who would abuse or even kill pilgrims for their own reasons of greed and plunder. However, clearly he focused mostly on the religious fervor and righteous cause of the Crusade ideal in down-to-earth examples that would encourage people when thinking of taking the Cross.

Jacques de Vitry was an important ecclesiastical figure in the Latin Kingdom from the moment of his arrival in Acre in early November 1216. He is notable as a spokesman for the new Crusade, as we have indicated, as both preacher and writer. In this he operates as an important participant in the Fourth Lateran Council who came East with knowledge of the significant canons of the Council that would bear on the Latin church in the Crusader States. Indeed some of those canons were directed at the Latin East in particular, for example, the imposition of a tithe on all Eastern-rite Christians. The fact was, however, that the Latin bishops in the East were far too sensible to attempt to impose the tithe, or certain other Latin prescriptions, including formal obediance from the members of the Orthodox church resident in Latin dioceses, as well as their formal recognition of papal primacy.[55]

There were, however, canons of the Fourth Lateran Council that Jacques de Vitry would have been duty-bound to enforce among his own clergy, and some of them must have had a direct impact on artistic activity in the Latin East. Julian Gardner has recently drawn attention to the importance of the canons of this Council with regard to the liturgy. As he points out,

> altarpieces are not obligatory for the celebration of mass, but in the thirteenth century, . . . , altars, the mass, and its celebration procedures were all regulated by canon law, in the first instance, and local custom or convention secondarily.[56]

We shall want to examine any shred of evidence we can find to help determine what local custom in the Crusader East may have added to the altar with its prescribed two candles and a crucifix for the celebration of the Latin liturgy.[57]

Finally, Jacques de Vitry is also a stellar example of the kind of able and educated bishop Innocent III had wanted to send out from the West for all major sees in the Latin East. However, Jacques de Vitry came east with a strongly developed Western point of view. He is highly critical of other, non-Latin Christians, not to mention non-Christians, and has what J. Prawer called "a permanent holier-than-thou attitude."[58] He seems to embody the mentality of the new colonial Latin clergyman in the thirteenth-century Crusader Kingdom. Hamilton points out that, "a high proportion of the Latin bishops of Syria in the 13th century had been trained in western Europe, and reflected in their thinking the greater desire for strict theological conformity with Roman standards of orthodoxy which inspired the papacy in its dealings with eastern-rite Christians from the pontificate of Innocent III."[59] With Jacques de Vitry these Roman standards of conformity also extended no doubt to liturgical practices. For the most part this position when adopted resulted in the growth of hostility between the Latins and the Orthodox, whether Greek or Syrian, or other Eastern Christian sects for that matter. The question remains, however, as to what extent other bishops took this high-profile, strongly Roman point of view, in regard to faith, liturgical and devotional practices, and administration. In this regard Jacques de Vitry and some of his colleagues from the West are curiously different from Pope Honorius III – the pope who consecrated Jacques bishop of Acre – who could on occasion be quite irenical with regard to the Greek Orthodox. In particular we recall that through this period, what Hamilton calls "cordial links" were maintained between the papacy and the Monastery of St. Catherine's on Mount Sinai.[60] These fraternal Christian relations worked well with Sinai where other resident Franks were not an issue. However, they usually did not fare so well in situations where the parity of Latin and Orthodox Christians became an issue, as in most Latin dioceses in the Crusader States. It was especially true in Antioch and other places where the Greek Orthodox population was a really major important factor in contrast to the other Eastern Christians. Certainly while the Fifth Crusade was active in the Latin East, such fraternal Christian relations with Eastern Christians were not much in evidence.

THE FIFTH CRUSADE AND ITS IMPACT ON THE CRUSADER STATES IN SYRIA-PALESTINE, 1217–1221[61]

June 1217 had been announced as the date for the departure of the Crusade, and the ports of Brindisi and Messina had been designated points of departure where the pope had hoped to bless the Crusader fleet, before his untimely death. As the time to depart neared, it became evident that the expected large contingent of German and Austrian Crusaders would still be outnumbered by the French. More surprising was the lack of Hungarians involved at this point in the Crusade.[62] In Germany, Frederick II continued to negotiate the time of his departure, among other things, and nothing had been resolved. The result was that few Crusaders actually boarded their ships in Brindisi and Messina until a year later. However, there was considerable enthusiasm on the part of the Austrians and the Hungarians who assembled at Spalato (Split). Duke Leopold VI of Austria sailed in August 1217, followed by King Andrew of Hungary shortly thereafter. The first Crusader contingents started arriving in Acre in September 1217 with others straggling in during the spring of 1218.[63]

A fleet of Rhenish and Frisian Crusaders had actually sailed early from the Netherlands, in May of 1217. The Rhenish soldiers stopped in Lisbon and decided to aid the bishop of Lisbon fight the Arabs at al-Qasr, which was successfully taken on 21 October 1217. At that point some members of the army decided that they could not continue to the East; the others wintered in Lisbon and then set out again in the early spring. It looked suspiciously like a partial replay of the experiences that befell the Fourth Crusade in 1202. Meanwhile the Frisian fleet had sailed on, entering the Mediterranean and wintering at Civitavecchia. It was mostly the remnants of the Rhenish and the Frisian fleets with various Italian contingents that arrived belatedly at Acre in April and May, 1218.

Duke Leopold and his army arrived in Acre after a smooth and rapid voyage of only sixteen days. King Andrew was not so fortunate. When he arrived in Spalato with a large army, there were not enough ships to transport him. As J. Riley-Smith points out, it was just the opposite problem to what had faced the Fourth Crusaders who arrived in Venice in 1202. At Spalato in August 1217, there were too many soldiers and the king had to wait several weeks, and even then some knights had to make plans to sail after the winter. In any case when Leopold arrived in Acre, he was met by King John of Brienne, the patriarch of Jerusalem, the bishop of Acre, and other high clergy, the masters of the Templars, the Hospitallers, and the Teutonic Knights, and many nobles of the kingdom. Then other major rulers joined the assembly including Count Bohemond IV from Tripoli and King Hughes from Cyprus; eventually King Andrew also arrived in late September. As soon as everyone had gathered, in October a council of war was held in the great tent of the king of Hungary, where it was decided to attack the Muslims now that the truce with al-Adil had expired.[64]

From the point of view of King John of Brienne, an immediate campaign against the Muslims was an excellent idea to unify the army and to feed the men, in the face of poor harvests that summer. Oliver of Paderborn reports that the army set out just after All Saints Day, and that the patriarch of Jerusalem carried a relic of the True Cross.[65] It is the first time that such a relic is mentioned by a chronicler as belonging to the Crusaders, that is, not the Syrian relic, and which is employed by a Crusader army since the terrible battle of Hattin.[66] The Crusaders marched southeast past Nazareth and La Fève across the plain of Esdraelon and down to Bethsan (Bessan) where they found the town largely deserted, but with valuable grain supplies and many animals.[67] From Bethsan, the army marched up the Jordan Valley, foraging in this rich agricultural region; they crossed the Pont de Judaire, marched around the Sea of Galilee, and came back across the Jordan at Jacob's Ford, before returning south past Tiberias and then west to Acre. The Paris Eracles reports that al-Adil and his son, al-Mu'azzam, watched this large army from a mountain vantage point at al-Fulah on the south side of the Plain of Esdraelon, with his forces in Nablus, but he had no intention of engaging the Crusaders.[68] When the Frankish army came to Bethsan, he sent al-Mu'azzam to occupy and protect Jerusalem, and he maintained a defensive position in the Jordan Valley region.

Oliver of Paderborn describes the Crusader activities from November 1217 to February 1218 very clearly in terms of three brief campaigns, which need not be discussed in any detail.[69] After the first campaign, that is, the march to Bethsan and the Jordan Valley, the army was provisioned and had reconnoitered the territory around Mount Tabor. The second campaign was an unsuccessful attack on Mount Tabor, which was a bellwether for the Crusade because it was one of the objectives that Innocent III had mentioned in his encyclical in 1213.[70] The fact that it could not be taken was a harbinger of the difficulties that the Crusaders would face all through this operation; seen in hindsight, the symbolism of this failure was ominous.

The third phase of these early activities by the Crusade was undertaken by only a small part of the army, a small contingent of Hungarians, shortly thereafter, in early January of 1218. They attempted to march past the Castle of Beaufort and enter the Bekaa Valley to the north, but were driven back and forced to return to Acre. At this point King Hugh of Cyprus died suddenly on 10 January and King Andrew, who had declined to participate in either of the latter two expeditions,[71] decided somewhat abruptly to return home.

Despite the promise that King Andrew had brought to this Crusade by his taking the Cross and leading an army, in the end he contributed little and seemed to have viewed the expedition partly as a chance to collect precious relics. During the November campaign he is reported as having found one of the water jars used by Christ in the miracle at the wedding feast of Cana.[72] By the time he had decided to leave the Holy Land and return home, he had made further acquisitions including the head of St. Stephen, the head of St. Margaret, the right hand of St. Thomas, the right hand of St. Bartholomew, and part of Aaron's rod.[73] We have little evidence of other Crusaders collecting relics on this expedition, so these acquisitions by Andrew are of considerable interest. We may imagine that although the water jar obviously could have come from somewhere in Galilee, most if not all of these relics probably came from Acre where the king had spent most of his time between the end of September and early January.[74] This suggests that relics were available and that the metalworkers must have been able to supply suitable containers. Thus, even though we hear little else about it, the traffic in relics apparently continued to exist in 1217–18 just as it had existed during the visits of Martin of Pairis to Acre before and after the Fourth Crusade. The problem is that like so many other aspects of activity linked in some way to artistic production, we only can find an occasional glimpse of what was happening in these years.

The patriarch of Jerusalem pleaded with King Andrew not to desert the Crusade when it was just getting started, but Andrew felt that he had completed his vow. Nothing could change his mind, not even the threat of excommunication by the patriarch.[75] Andrew and his men marched north through Tripoli, Antioch, and Cilician Armenia. He crossed Asia Minor with a guarantee of safe-conduct from the Seljuk sultan and eventually reached the Latin Empire en route home. Thus Andrew was on his way to the West, as the German and Frisian fleets were preparing to continue sailing to the Holy Land. This example demonstrates the frequent problem in Crusader armies of establishing suitable military objectives with a clear chain of command.

Despite the loss of King Andrew and his men, other Crusaders were known to be coming East, not only the fleets mentioned previously, but also French crusaders who were leaving from southern Italy. While waiting for these reinforcements, King John and Duke Leopold of Austria conferred with the Hospitallers, Templars, and Teutonic Knights over work that could be done to aid the Holy Land until these other contingents arrived. The Paris Eracles reports succinctly that they decided to build fortifications at Caesarea and Chastel Pelerin.[76] Caesarea was refortified by one contingent of Crusaders in an intensive campaign of construction lasting several weeks. On the Feast of the Purification, 2 February 1218, the patriarch of Jerusalem assisted by no fewer than six bishops celebrated mass in the Church of St. Peter, to thank God for the rebuilt city walls. Meanwhile, the Templars assisted by the Teutonic Knights and other soldiers, along with the Flemish lord Walter of Avesnes, who donated money to pay for the work – the Paris Eracles says he put 1,000 saracen bezants on the first stone[77] – built a large and powerful new castle at what is now called 'Atlit.

'Atlit is a promontory on the coast between Caesarea and where Mount Carmel comes down to the sea. The Third Crusade had camped at this spot with Richard I in 1191 when it was little more than a fortified tower, known as "Destroit," which protected this vulnerable part of the coastal road. Now a major castle was constructed by digging a formidable ditch across the promontory where it joined the mainland and erecting two massive walls with square towers behind it, making it virtually unassailable from the landward side.[78] Oliver of Paderborn gives a detailed description of its construction, and he reports that God was with these intrepid builders, who found a large hoard of coins to help pay for the work.[79] By providing these presumably ancient coins,[80] God assisted this project, along with providing springs of fresh water and ample supplies of stone and cement, according to Oliver. The castle was fortified on its three other sides with smaller walls of various fortified structures, but the main defense was the sea and the sharp dropoff of the beach into deep water around this promontory.

Johns says that Walter of Avesnes named this castle "Pilgrim's Castle," that is, "Chastel Pelerin," because it was built by members of the Crusade, even though it was subsequently garrisoned by the Templars.[81] The work was done with all deliberate speed without Muslim intervention, and most of the soldiers were back in Acre before the next expected Crusaders arrived on 26 April 1218. Both Caesarea and Chastel Pelerin were important to the Crusaders and the Latin Kingdom because they protected the coastal road south of Mount Carmel, they both had small harbors, and they both provided staging areas for Crusader armies marching south. It was just after the time that Chastel Pelerin was completed that al-Adil ordered the castle on Mount Tabor dismantled and evacuated.

As soon as the spring *passagium* began to bring new Crusaders to join the expedition in late April, King John of Brienne called a conference to start planning for the next phase of this expedition. The fundamental goal of attacking Egypt – a strategy that Richard I "The Lionheart" had advised in 1192 – was never in doubt. This decision had already been spelled out at the Fourth Lateran Council.

The sources do not enlighten us about the Crusaders' reasons for choosing Damietta over Alexandria, but three points are evident nonetheless. There had been several Crusader incursions into the Nile Delta since 1192, when Richard I had first voiced the advisability of an attack on Egypt.[82] The Crusaders had knowledge about the Delta region, the fortifications of the two main cities, and the strategic value of Damietta compared to Alexandria. Second, even though Damietta in 1218 was a major fortified city, it was apparently said by some to be "the key to Egypt" and the most direct route for the Crusaders to take toward Cairo. It was certainly not the small, insignificant town, Damyat, that it is today, but it was smaller than Alexandria and closer to Cairo.[83] And third, European – mostly Italian, and especially Venetian with some Genoese and Pisan – merchants were active in both Damietta and Alexandria. If, as was the case later, in 1249, when Louis IX also decided to attack Damietta, there were more Venetians in Alexandria and more Genoese and Pisans in Damietta, another reason to attack Damietta would be evident. The Venetians had certain commercial arrangements in force with al-Kamil since 1208 and 1217 that they did not want to disturb,[84] and they were known to be unenthusiastic about the idea of a Crusader attack on Egypt from the time of the Fourth Crusade.[85] Thus there was the possibility of both "positive" and "negative" reasons for choosing an assault on Damietta.

The Crusaders sailed from Acre on 24 May 1218 with the first contingents arriving on the coast of Egypt on 27 May. Besides King John of Brienne, there were also the patriarch of Jerusalem and the bishops of Acre, Bethlehem, and Nicosia as well as Duke Leopold.[86] They camped on the left (west) bank of the river to the north of and across from Damietta, and they began to organize their assault on the city in early June. They elected King John of Brienne as their commander.[87] Sultan al-Kamil arrived with his army on 6 June and camped south of the city at al-Adiliyah to direct defensive operations. The city itself was located about three miles from the mouth of the main eastern branch of the Nile on the right (east) bank. Oliver of Paderborn describes it as being fortified with three circuits of strong walls, that there was a moat between the outer and second wall, and that the second wall had twenty-eight towers.[88] To protect the port, there was a chain stretched from the right bank just below the city to a strong tower on a small island near the left bank. Behind the chain, a bridge of boats was positioned to block any attempt to enter the port by water.

The first Crusader attack on the tower failed despite an eclipse of the moon and the presence of the patriarch with a relic of the True Cross.[89] In July the Crusaders invented a new assault engine, suggested by Oliver of Paderborn himself, to use for their attack. It consisted of a small castle built on top of four masts from two ships tied together, a kind of siege tower that could float on water. On August 17, the Crusaders prepared to attack with prayers led by the patriarch carrying the True Cross relic, with other clergy. The next day the battle began and by August 25 the Crusaders prevailed, occupied the Muslim tower, and then cut the chain sealing off the port. However, they did not press their advantage by trying to attack Damietta itself. The annual flooding of the Nile had begun on 18 August, and soon many of the German and Frisian soldiers would be leaving to return home, having completed the obligations to their vow. The leaders of the Crusade wanted to see what reinforcements would come on the fall *passagium* before committing themselves to a full-scale attack on the city.[90]

Fortune favored the Crusaders in Egypt because on 31 August the venerable Muslim leader, al-Adil, died in Damascus, where his brother Saladin had died years earlier. Al-Adil's death forced a transfer of power to the more aggressive al-Mu'azzam in Syria and to al-Kamil, currently in command of Muslim forces at Damietta. This situation meant that there were no attacks by al-Kamil on the Crusader camp across from the city for many weeks, until early October.

However, the restless al-Mu'azzam was already on the march in late August and had attacked, captured, and destroyed the recently rebuilt walls of Caesarea just before his uncle died.[91] This was the second time that the walls of Caesarea had been dismantled since 1191. Al-Mu'azzam also reportedly reconnoitered the new castle held by the Templars at 'Atlit, but not surprisingly found it too formidable for an attack at that time. Elsewhere the main Crusader cities of Acre and Tyre were strongly garrisoned, however, and were not in danger of a similar attack.

Meanwhile the fleet that the pope had organized for the soldiers waiting in Brindisi arrived in late September, with his legate Cardinal Pelagius in charge. Pelagius was accompanied by Robert de Courçon, his aide, who was sent as spiritual advisor to the French Crusaders. A separate fleet brought a large contingent of Englishmen, and later, toward the end of October, a large French army arrived from Genoa. Being aware of the arrivals and departures of Crusaders, al-Kamil decided to attempt a direct attack on the Crusader camp to test their strength. On 9 October 1218, al-Kamil led a sizeable force across the river undetected from his camp at al-Adiliyah south of the city. Landing at Burah, al-Kamil attacked the camp of the newly arrived Italian Crusaders and was driven off by a strong counterattack led by King John of Brienne. Another Muslim attack on 26 October against the Templar camp also failed.

Having taken the fortified tower protecting the harbor northwest of Damietta, the Crusaders wanted to find a way to cross the river south of the city in order to surround it. For this purpose they dredged out an old canal to the sea on the left bank during the month of November. A storm on the night of 29 November, which continued for three days, flooded the whole area, killing many horses and inundating the Crusader camp. However, it also filled the canal and now Crusader ships could reach the river south of the city. Following the flood the Crusaders were also forced to face a very severe winter. Then a serious epidemic struck, possibly scurvy,[92] killing many, including Cardinal Robert de Courçon. Various chroniclers give differing estimates; Powell thinks that overall the army lost about 20 to 25 percent of its manpower.[93] Because of these difficulties, morale was low.

According to a number of modern historians, it is at this point that Cardinal Pelagius begins to play a more prominent role in the affairs of the Crusade.[94] Among the contemporary chronicles, it is striking that some writers, such as Oliver of Paderborn and John of Tulbia, describe the activities of the legate, but Pelagius does not appear prominently in the Paris Eracles or the *Chronique d'Ernoul* until later, when Damietta is finally taken and he quarrels with King John. Although King John of Brienne had proved to be an able military leader, and although Pelagius was a papal legate, therefore not a military combatant, the pope had "expressed the hope that all would obey him to the end that the Cardinal might establish order and concord among them."[95] Pelagius was able to begin winning the confidence of the Crusaders as he gradually took a more active role, for example, when he was asked for spiritual guidance during and after the storm. One incident recounted by John of Tulbia describes how, when the storm was continuing, Pelagius led the Crusaders out to their newly built rampart and prayed. He cited the Gospel of Matthew 8: 23–27, where Jesus calmed the storm, and soon the storm abated and the sun came out.[96]

The bad winter continued – unusually cold with rain and hail – but Pelagius believed that activity would improve the morale of the soldiers. He advocated an attack on al-Kamil's position on the right bank just south of the city. Pelagius preached to the troops urging them to attack on Saturday, 2 February 1219, the Feast of the Purification of the Virgin. The attack failed in a blinding rainstorm, but word reached the Crusaders the next week that al-Kamil and his troops were withdrawing from their camp at al-Adiliyah. The Crusaders crossed the river uncontested to find the camp deserted but full of supplies. The *Gesta Obsidionis Damiate* reports that St. George armed and dressed in white, accompanied by innumerable soldiers, appeared to the Muslims in their camp, and they were so frightened that they fled leaving everything behind.[97] The Crusaders occupied the camp and now basically had the city of Damietta surrounded.[98]

Al-Kamil had actually left his position quite suddenly because of a plot against him in Cairo, which he successfully quashed with the aid of his brother, al-Mu'azzam, who had marched quickly from Syria. Once the threat of the conspiracy was over, al-Kamil returned to Damietta to attempt to recapture his camp, but even with the help of al-Mu'azzam, he could not. The Crusaders fought them off, and al-Kamil was forced to set up a new camp at Fariskur, farther south of al-Adiliyah. Pitched battles continued through the spring. Al-Kamil launched major attacks at the beginning and end of March, but neither side was able to win an advantage. As yet the Crusaders could not mount an assault on the wall of the city of Damietta itself.

In describing the Crusaders camped around Damietta in the spring of 1219, the Paris Eracles emphasizes the multiplicity of the various contingents. It lists King John with the French[99] and the Pisans camped with them, the Templars with the count of Nevers in another "canton," with the Hospitallers in yet another, together with the Spanish and the Provençals. In another "canton" Pelagius was found with the Romans, the Frisians, the Genoese, and the rest of the Italians. Finally the Teutonic Knights were in yet another part of the Crusader camp. The variety of the Frankish troops and the multiplicity of their languages point to a very real problem with this Crusader army – a problem typical of almost all Crusader armies – the need for a strong personality to lead the men, someone who could rise above the mélange of languages and cultures and exercise command. Curiously, this text does not mention Duke Leopold of Austria, who was one of the strong leaders, along with King John and with Cardinal Pelagius; nor does it mention his followers, but we know that in early May, Leopold and many other Crusaders decided to return home. Despite the arrival of some new Crusaders on the spring *passagium*, morale was down in the army after a long difficult winter, as Jacques de Vitry points out.[100] Nor did it help matters that Frederick II had postponed his departure again, as negotiations over his coronation as emperor dragged on.[101]

Meanwhile, al-Kamil and his brother al-Mu'azzam were clearly worried about their inability to retake their old position at al-Adiliyah from the Franks, and the possibility that Damietta might be taken. Considering the consequences that might follow if the Crusaders successfully continued their campaign, al-Mu'azzam returned to Syria-Palestine, and in the middle of March 1219, he took the remarkable step of dismantling the fortification walls of Jerusalem.[102] It was a notable and important action not only because of how graphically it reflected the seriousness of the situation from the Muslim point of view, but also because al-Mu'azzam had sponsored substantial construction in Jerusalem during the immediately preceding years, as three surviving inscriptions indicate.[103] In any case, Abu Shama describes the scene in the Holy City after the order had been given to tear down the walls:

> Demolition work got underway on the 1st of Muharram [i.e., 19 March]. There was in the city a terror like that of Judgement Day; women and girls, old men and women, young men and children, all sought refuge in the Sakhra [Dome of the Rock] and al-Aqsa mosque; they cut their hair and tore their clothes. The prayer-niche of the mosque was full of hair. Convinced that the Franks were coming, these unfortunates fled, abandoning their goods and effects; they blocked the streets, some of them heading for Egypt, others to Kerak or Damascus. Some of the young women tore strips off their garments to cover their feet, blistered by the march. A great number of fugitives died from hunger and thirst. Never had such a catastrophe struck Islam.[104]

What irony that at a time when the Crusader army was struggling with low morale, the sultans of Egypt and Syria were preparing for the awful eventuality that they might have to turn Jerusalem back to the Crusaders. Before that happened they wanted the walls of Jerusalem to be taken down so it could not become again a fortress used against them.[105] In fact, al-Mu'azzam was not content only to dismantle the walls of Jerusalem; he also took down the walls of several other fortified positions: at Baniyas, Safed, and Toron.[106] Now that he had had to dismantle the castle on the top of Mount Tabor, he did not want the Crusaders challenging him from other sites in the Galilee region.

The Crusaders seemed to know nothing of how precarious the Muslim situation was. Facing a stalemate, the army struggled to hold their position in the blistering heat. Pelagius urged an assault on the city walls after a particularly strong attack by al-Kamil had been driven off on 20 July. Again the Crusaders suffered heavy losses, this time from the Greek fire used by the defenders. Al-Kamil attacked their camp again, and again the army held on. On 6 August they again attempted an assault on the city, but they were driven off. Pelagius and King John disagreed on strategy, no doubt with good reason because even though the legate was a powerful preacher and motivator, he obviously had little military experience. The soldiers were confused and discouraged. A badly organized Crusader attack on 29 August almost resulted in disaster, but King John was able to save the day after some heavy fighting.[107]

At this point, a remarkable new visitor had arrived in camp, Francis of Assisi.[108] Francis had preached to the Crusaders before the battle on 29 August and predicted it would fail. Furthermore, when al-Kamil saw the Crusader army retreat back to its camp, and fearing for the worsening conditions of the Muslim garrison inside Damietta, he sent a Crusader prisoner with an offer proposing a truce. Francis seized this opportunity and requested permission to speak to the sultan himself. Pelagius feared that Francis would be killed and at first he would not permit it, but Francis persisted and eventually prevailed in the sense that Pelagius would not forbid him to go.

It is difficult to imagine what al-Kamil thought when Francis was brought to him, but somehow the sultan recognized in him the sincerity of his religious commitment. Francis wished to convert the sultan by demonstrating in argument and through an ordeal by fire that Christianity was the true faith. Al-Kamil listened to Francis's appeal and treated him respectfully, even gently, and with hospitality befitting a man of God. After conferring with his advisors, he declined to engage Francis in debate or allow an ordeal, but he placed Francis under his protection. The sultan offered him gifts, which Francis politely refused, and had him escorted safely back to the Crusader camp.[109]

Despite this unique episode with Francis, the sultan's offer of a truce was still open.[110] The sultan proposed the following remarkable terms: Jerusalem would be returned to the Crusaders and al-Kamil would pay to have the walls of the city rebuilt! The castles of Belvoir, Safed, and Toron would be given back to the Crusaders and could be refortified. Twenty Muslim hostages would even be handed over to the Crusaders to hold until the reconstruction work was finished. The relic of the True Cross lost at Hattin would be returned to the Crusaders, and any Christian prisoners from Hattin still alive and held in Syria or Egypt would also be returned. The Crusaders for their part would evacuate Egypt completely. Finally, the truce proposed would last for the unprecedented period of thirty years.[111]

Unbelieveably Pelagius and the clergy opposed this offer from the outset, along with the Hospitallers, the Templars, and the Italian Crusaders. By contrast, King John of Brienne, the northern European Crusaders, and the Teutonic Knights favored accepting it. Here the serious split between Pelagius and King John that had begun forming over military strategy during the winter was now out in the open. While the debate raged in the Crusader camp, they accepted a temporary truce, and both armies took advantage of the respite to reorganize their soldiers and to rebuild their defensive positions.[112] To some this offer may have seemed too good to be true, while others may have doubted that al-Kamil actually had the True Cross relic from Hattin. For the Hospitallers and the Templars, a major stumbling block in al-Kamil's offer appears to have been the fact that the sultan would not return the two Transjordan castles of Kerak and Krac de Montréal, or Shaubak. They felt strongly that these fortifications were essential for the defense of Jerusalem. The Muslims knew from past experience, however, that these two fortresses were critical to protect the main routes between Damascus and Cairo for communications and military purposes, not to mention reasons of commerce and pilgrimage to Mecca. Al-Kamil offered to pay tribute for these castles, a total of 15,000 bezants, but still the Crusaders refused.

In the face of what seemed like such a golden opportunity, there were certain bases for Crusader opposition to this offer. Clearly some of the Crusaders believed that with reinforcements said to be coming from Europe, the army could take Damietta and defeat al-Kamil.[113] In any event the Crusaders had been in position around Damietta for many months, and even if they had not been able to mount a decisive attack as yet, the siege had sealed off the city. Many in the army must have believed Damietta could not hold out much longer. Many of the Italians in the army must have been opposed to the idea of giving up Damietta, given the commercial interests of the main maritime cities there. It is also possible that Pelagius thought, as many recently arrived Europeans did, that it was wrong to negotiate on equal terms with the Muslims. Some held this view despite the fact that Richard I had done it and the Latin king of Jerusalem had been treating with the Muslims for years. Nonetheless, the argument that Kerak and Montréal were essential to the defense of Jerusalem was somewhat suspect since they were both in Crusader hands when Jerusalem fell in 1187; they did not fall to Saladin until 1188.

Negotiations continued into late September. Meanwhile a number of Crusaders had decided to return home in mid-September, including the leaders of the Roman contingent, a Hungarian archbishop, and several counts. The *Gesta Obsidionis Damiate* estimates that a good twenty-thousand soldiers departed on the fall *passagium*.[114] Only the arrival of Savaric de Mauleon with a sizeable force two weeks later restored the morale of the troops left behind.[115] Al-Kamil, however, seeing the changeover and hearing no definitive reply to his offer, resumed the attack, partly to try to relieve the garrison inside Damietta, partly to maintain pressure on the Crusader camp.

As November began, al-Kamil attempted to relieve the city with a daring raid through Crusader lines held by the count of Nevers.[116] After the attack was beaten off, the Crusaders prepared for a major assault on Damietta. On the night of 4 November, Italian sentries observed a tower in the walls of the city to be unguarded. The Crusaders quickly exploited this discovery, and, as Oliver of Paderborn reports, "on the night of the 5th of November Damietta was captured without treachery, without resistance, without violent pillage and tumult."[117] Oliver, down-to-earth and apparently experienced about soldiering as he was, saw the victory as essentially orderly with a minimum of looting. Jacques de Vitry, the excitable and outspoken bishop of Acre, however, decries what he saw as lamentable theft and rape in the wake of the Crusader victory.[118] The population of the city and its defenders had, in any case, been decimated by disease apparently caused by the siege and the severe conditions. Oliver reports that out of a population of 80,000, only three thousand were alive.[119] The city was wealthy and had substantial food supplies, which the Crusaders seized immediately.[120] The *Gesta Obsidionis Damiate* reports that they also found gold, silver, precious stones and rich textiles, and gold and silver vessels.[121]

The loss of Damietta resounded throughout the Muslim world. Ibn al-Athir reports darkly what the situation looked like from the Muslim point of view:

> The entire Muslim world, men and territories, seemed likely at this moment to be lost to the East on the one hand and the West on the other: from the East came the Tartars, ... while from the West came the Franks, who took a city like Damietta in Egypt because of its lack of fortifications to protect it from an enemy. All the rest of Egypt and Syria was on the point of collapse and everyone was terrified of the invaders and went in anticipation of disaster night and day. The population of Egypt was even ready to evacuate the country for fear of the enemy, but "it was no time to escape," [Qur'an, sura XXXVIII,2] surrounded as they were on all sides by the enemy.[122]

Al-Kamil considered an immediate attack on the city with the hope of reconquering Damietta before the Crusaders organized their defenses, but he found no opportunity. So his strategy turned to the defense of Cairo, and he retreated from his camp at Fariskur farther into the Delta, at Talkha and al-Mansourah. At that point, where a tributary of the Nile branched off from the eastern fork of the river, al-Kamil reestablished his camp. Meanwhile, the Crusaders spent a tumultuous November quarreling over the spoils of victory.[123] King John claimed

the city as commander of the army for the Latin Kingdom of Jerusalem, but Pelagius claimed the city in the name of all Latin Christians of the West, that is, the Church. With this disagreement, the leadership of the Crusade was once more in serious doubt. Eventually Pelagius was forced to compromise and recognize King John as ruler until Frederick II could arrive to take command.[124]

King John proclaimed his status by issuing a new denier carrying the legends, "+DAMIATA" on the obverse around a crowned bust of the king, and on the reverse, "+ IOHES: REX:" around an equal-armed cross.[125] It is interesting that John abandons the architectural motif of his and other royal coins from the Latin Kingdom, and adopts the bust-length crowned king type that Guy de Lusignan and Levon II had used and that was common in England at this time. This "+DAMIATA" coin was apparently issued in substantial quantities and has been found in large numbers in hoards from the Crusader States in the years after *c.*1220, indicating that it was widely circulated (Fig. 60). It apparently was King John's standard new coin after the Holy Sepulcher drachma that he issued between 1212 and 1217.[126] Questions remain, however, about the meaning and function of a comparatively much more rare denier that carries the "+DAMIETA" legend on the reverse and an image of the king on the obverse with puzzling iconography (Fig. 59).[127]

It is worth noting that at this point there was uncertainty about the goals of this expedition beyond Damietta among some of the Crusaders. Jacques de Vitry had written succinctly the following about their objectives in 1218:

> We planned to proceed to Egypt, which is a fertile land and the richest in the East, from which the Saracens draw the power and wealth that enable them to hold our land, and, after we have captured that land, we can easily recover the whole kingdom of Jerusalem.[128]

Jacques de Vitry further describes Egypt as having three major cities, Damietta, Alexandria, and Cairo, and as being a privileged land for Christians because Jesus had come here with the Holy Family. Like the *Gesta Obsidionis Damiate*, Egypt is viewed as a land to be subjugated and controlled by the Crusaders. Ernoul saw the objective here very differently. As he reported to the Crusader council in Acre in 1218, the king had proposed to the Crusaders that if they went to Egypt and took Alexandria or Damietta, then this would enable them to have back the Kingdom of Jerusalem.[129] He clearly means by treaty or exchange.

Just as the Crusaders were quarreling over the distribution of the spoils of victory, the future of the expedition was also unresolved. An immediate march on Cairo might have succeeded with al-Kamil's army in retreat, with the shortage of food because of poor harvests and because al-Mu'azzam was returning to Syria with his army, but the Crusaders did nothing.[130] A raid at the end of November on Tanis, east of Damietta, yielded more supplies and spoils that only led to more dissension.[131] It would take three months for the Crusaders to settle the allocations. On the Feast of the Purification of the Virgin, 2 February 1220, John of Tulbia reports that Pelagius and all the clergy finally celebrated the Crusader victory. They formed a procession with the relic of the True Cross and consecrated the central mosque of the city as the Cathedral of the Holy Virgin, with altars dedicated to the Virgin Mary, to St. Peter, to the Holy Cross, and to St. Bartholomew.[132]

Because the Crusaders did not seize the opportunity to move ahead, developments forced them, especially King John of Brienne, to react to several different new situations. After the conquest of the city of Damietta was duly celebrated, King John sought permission to leave the Crusade. He asked the pope to return urgently to Acre to defend his kingdom, which had come under attack by al-Mu'azzam.[133] Al-Mu'azzam had assaulted Caesarea after returning to Syria following the fall of Damietta, and captured it late in 1219.[134] He was now threatening the Latin Kingdom farther north, from 'Atlit to Tyre. Safed was dismantled by al-Ashraf, the son of al-Adil. There were other reasons why John of Brienne needed to return to Acre. His wife, Stephanie of Armenia, had recently died, as had their infant son, and he wished to put forward his claim to be heir to the Cilician throne.[135] Finally, there were two other pressing reasons for John's departure. First was the fact that he was out of money; in the four months after the conquest of Damietta he had spent the last of his resources on the army.[136] Second, there was the obvious reality that he and Pelagius did not see eye-to-eye on command and control, strategy, or management and administration, and therefore he could not expect any help from the legate for his financial situation or support for his leadership.

In late February 1220, a letter arrived from the pope supporting Pelagius as the leader of the Crusade in both spiritual matters and in temporal affairs, the latter referring to his authority in the division of newly conquered lands.[137] In this state of affairs, but with the pope's permission, King John sailed for Acre on 29 March 1220.[138] Different writers expressed various opinions as to why King John of Brienne left the Crusade at this point. Jacques de Vitry stated, surprisingly, that John "deserted the army."[139] Oliver of Paderborn said the king claimed numerous reasons, without naming these reasons or explaining them.[140] The clergy of the Latin Kingdom, however, writing to

King Philippe Augustus for aid to the Holy Land in October 1220, identified the reason as poverty.

> This poverty, moreover, was the chief reason why the king, compelled by necessity, had to leave the army and withdraw to Acre.[141]

The Crusader army languished in Damietta while King John was back in Acre. Oliver reports that the people in the army indulged in fornication, among other things, and lost their spirit.[142] More Crusaders left to return home: Ranulf, earl of Chester, and a contingent from Lucca sailed home in the summer and fall respectively.[143] As the months wore on, it became clear that Frederick of Hohenstaufen was apparently not coming, but he started to send soldiers to Damietta; Count Mathew of Apulia arrived in the fall.[144] With or without the long hoped-for imperial army, Pelagius was nonetheless determined to march on Cairo. In his view the Crusade could conquer all of Egypt just as it had captured Damietta. Even without Frederick, Pelagius wanted to set the operation in motion, but the soldiers would not agree while John of Brienne was absent.[145] Meanwhile King John had his own problems to deal with, including attacks on Acre and especially a major siege of Château Pèlerin by al-Mu'azzam.[146] The Templars poured hundreds of men into the castle to bring the garrison up to some four thousand soldiers. After besieging 'Atlit for a month, al-Mu'azzam withdrew at the end of November 1220, realizing that with a full complement of defenders and supplied from the sea, he could not take the castle by means of a frontal assault.

It was at this point, on 22 November 1220 in Rome, that Pope Honorius III finally crowned Frederick II Holy Roman Emperor. Once again Frederick had renewed his Crusader vow, pledging to set out in the spring. Honorius had written to King John earlier, in August 1220, urging him to rejoin the Crusade in Damietta. He also wrote to Pelagius in early January 1221. Powell describes the letter as including the following:

> urging "him to continue to move with caution. He alluded to the preparations underway for strengthening the army and the commitments made by Frederick at his coronation, but he expressed the view that there was still uncertainty about the fulfillment of their plans. In light of this, he suggested that Pelagius should explore the prospects for a temporary agreement with the Moslems, telling him to report back on this quickly if anything developed."[147]

It is evident that, just as with Pope Innocent III and the Fourth Crusade, the pope was heavily involved in trying to manage this Crusade from Rome without a full grasp of what the situation was, either in Damietta or in Acre. Furthermore Frederick II now began to play a more direct role in the Crusade, but based on his past record of plans and promises, Honorius III could not but be cautious about what to expect. Nonetheless, Frederick actively supported recruitment for the Crusade and in the spring, Louis, duke of Bavaria, his highest-ranking imperial representative to date, sailed for Damietta, arriving in May 1221. At this point Pelagius was determined to act, and Louis came ready to fight. Planning began for the next phase of the campaign. The legate wrote to King John of Brienne ordering him to return to the army with his troops. Louis drew up a plan, not to mount an all-out assault on Cairo, but to attack the camp of al-Kamil at Talkha, before the Nile began to rise in August. Meanwhile al-Kamil had written to his brothers, al-Ashraf and al-Mu'azzam, in Syria asking them urgently for reinforcements.[148]

In early July 1221, Pelagius ordered a three-day fast to prepare the army for the coming battle. The clergy with all the bishops carried the relic of the True Cross in procession out to the old camp at al-Adiliyah.[149] Two days later King John of Brienne arrived to find that mobilization was already underway. At this point, Ernoul reports that al-Kamil sent another thirty-year truce proposal to the Crusaders comparable to his earlier one.[150] Many Crusaders supported this proposal, including King John, and this time also the Hospitallers and the Templars, but Pelagius and Louis of Bavaria were still adamantly opposed. In doing this, Pelagius conveniently forgot about papal instructions in the January letter to report any possible truce opportunities; time was apparently too short.[151] Duke Louis was in a more difficult situation, because Frederick II had ordered him not to accept a peace proposal on the one hand, but also not to launch any major offensive action until he, Frederick, could get there.[152] Both of these directives were based on the assumption that he, Frederick, would very soon be joining the Crusade, but that had not happened, and Louis was forced to make a decision. The situation could not wait; Pelagius and Duke Louis ordered the operation to begin.[153] (Map 3)

On 17 July 1221 a large part of the army marched south along the right bank of the river. However, an even larger number of soldiers remained in Damietta to garrison the city.[154] The army passed the old Muslim camp at Fariskur and reached Sharamsah the next day, about halfway to Talkha and Mansourah. At that point they came under Muslim attack, which slowed their advance, but they pressed on. By late July the army reached the narrow triangle of land on the left bank of the river between the river itself and its tributary (al Bahr as-Saghir), across the tributary from Mansourah to the south and across the Nile from Talkha to the west. Behind them, at Baramun a small stream that went off to the west on the left bank of the river was filling rapidly with the rising water, enough to float large boats. Ahead, al-Kamil's army had been reinforced by troops newly arrived from Syria. The battle lines were drawn.

The horsemen and infantry of the army were supported by ships accompanying them along the river. Once the Crusaders had reached their position across from Mansourah, the Muslims, however, sent their own boats in behind those of the army and sank several Crusader vessels to block navigation downstream. At the same time, the Muslims crossed al Bahr as-Saghir near Lake Manzalah and sent horsemen into position between Damietta and the Crusaders. As the water rose during early August, the Crusaders were in increasing danger. Seeing that they could not cross the river or its tributary because of the rising water, the Crusaders had to decide whether to camp and wait for reinforcements from Damietta, or to retreat. Apparently they waited a short time only to see the situation worsen. Surprisingly, when Oliver of Paderborn reported that the decision to retreat was taken, it was the bishop of Passau and the Bavarians who prevailed.[155] Granted that the bishop of Passau may well have been part of the contingent of Louis of Bavaria, it nonetheless seems odd that at this moment of crisis, neither Pelagius nor Duke Louis nor King John, the main protagonists heretofore, are mentioned.

The retreat began on 26 August, a month after the army had arrived on the riverbanks across from Talkha and Mansourah. As the march northward began, al-Kamil opened sluices flooding the fields. Surrounded by the enemy, the army was now trapped by the water.[156] Once the hopelessness of their situation was realized, Pelagius ordered King John to sue for peace. John sent William of Gibelet to negotiate the settlement. Al-Kamil, consistent with his policy of forcing the withdrawal of the Crusader army from Egypt, offered terms. The Paris Eracles, Ernoul, and Oliver of Paderborn report the details: Damietta would be handed over to the sultan, all Muslim prisoners would be exchanged for all Christian prisoners, there would be a truce for eight years, and the sultan would return the True Cross.[157] Ernoul comments pointedly, however, that it was not the relic of the True Cross lost at the battle of Hattin.[158] Hostages were exchanged to ensure the terms would be kept; the leaders of the Crusade remained in the hands of al-Kamil, while the fifteen-year-old son of the sultan, one of his brothers, and several young emirs were given over to the Christians. The surrender took place at Baramun on 29 August 1221.

When the masters of the Templars and the Teutonic Knights were sent to Damietta with news of the surrender, the garrison at first refused to lay down their arms. A new contingent of Crusaders sent by Frederick II had just arrived, led by Henry, count of Malta. However, once the garrison understood the situation with the hostages and the surrounded army at Baramun, they had no choice but to accept the surrender terms. The arrangements were carried out with great propriety by al-Kamil. The hostages were treated with hospitality appropriate to their position and returned at the proper time. The trapped army was able to return to Damietta and given food. The Crusaders were allowed to take the personal property that they could carry home with them. On 8 September 1221, the Crusaders boarded their ships and sailed off to Acre. Al-Kamil installed a new governor in Damietta and he went back to Cairo. The Paris Eracles soberly concludes its account of this Crusade by blaming the sins, the folly, the pride, and the malice of the clergy for the loss of Damietta, which had been taken at such a cost.[159]

The Fifth Crusade came very close to accomplishing its goal, depending on what goal was identified. If the goal was to capture a major city in Egypt and bargain for the return of the Latin Kingdom to pre-1186 boundaries, the former the expedition accomplished and the latter it almost had in its grasp. If the goal was to conquer Egypt and destroy Muslim power in Cairo, the Crusade fell woefully short. In either case the Fifth Crusade was a failure. Needless to say much responsibility for its lack of success could be placed at the feet of the participants and their shortcomings. It is interesting that the Paris Eracles lays blame especially on the clergy, meaning apparently Pelagius and the bishops, but a certain amount of responsibility must also be placed on the chief nonparticipant, Frederick II. The possibility of his coming combined with the ultimate reality of his complete absence was a constant problem that the pope and the leaders of the Crusade struggled to deal with as the Crusade moved along.[160] It would take nearly seven more years before Frederick II would finally fulfill his Crusade vow and sail to the Holy Land, in 1228.

THE FINAL YEARS OF THE REIGN OF JOHN OF BRIENNE AS KING OF JERUSALEM

John of Brienne and the other Crusaders had found out indirectly by their experience on the Fifth Crusade that Frederick II had his own personal and political agenda, and could not necessarily be trusted to honor external promises and responsibilities until it suited his own plans. King John would find this out more directly between 1221 and 1225 to the detriment of the Latin Kingdom. In the meantime he returned to Acre to find that Cilician Armenia had undergone a change of ruler since his visit in 1220, and Bohemond of Tripoli was in control in Antioch.

These changes were quite consequential because it meant further developments in the relations among Cilician Armenia, Antioch, and Tripoli, states that John of Brienne had attempted to mediate for and with prior to the Fifth Crusade. Raymond-Roupen, whom Levon II had installed as prince of Antioch, was gone. Despite Raymond-Roupen's consultation with Pelagius in Damietta in the summer of 1220 and the support given to him by the pope, the Hethoumian leader, Constantine, captured him in Tarsus and put him in prison where he died, in 1221. Constantine Lampron, besides being the representative of one of Armenia's foremost aristocratic families, the Hetoumids, upheld Armenian values in the face of the latinizing tendencies of the Roupenids, visible in the persons of Raymond-Roupen and his father. With Constantine's support as regent, Levon's younger daughter, Isabella, was secure on her throne. However, in the face of Seljuk and Ayyubid neighbors it was important for Cilician Armenia to foster strong ties to Antioch. A marriage potentially politically advantageous for both sides was arranged by Constantine between Philippe of Tripoli, fourth son of Bohemond, and Queen Isabella. The result from the Armenian point of view was disappointing. Philippe had no interest in the Armenian religion and its ritual, which he had nominally joined. He clearly favored the Latin barons much to the chagrin of the Armenian nobility, and he was an absentee lord, spending as much time in Antioch and as little time in Sis as possible. In 1224, when they could countenance his indifference no longer, the Hetoumids had Philippe arrested en route to Antioch and imprisoned in Sis. When he was poisoned in prison a few months later, Queen Isabella was subsequently forced to marry Hethoum, Constantine Lampron's son, in 1226. Surprisingly, at this juncture Constantine also found it opportune to resume cordial relations with the papacy. He had messages of loyalty sent to both the pope and the Holy Roman Emperor in the name of the young couple.[161]

One surprising aspect of these complicated developments is the fact that the Hospitallers and the Templars were allied with different parties in the struggle, and indeed the two orders had almost reached a point of open warfare. Whereas the Templars had been warned by the pope not to have anything to do with Bohemond, who had been excommunicated by Pelagius, they stayed in communication with him, and they continued to be at odds with the Armenians. Baghras continued to be a contentious issue.[162] The Hospitallers meanwhile, having been expelled from Antioch by Bohemond and having had their property there annexed by him, openly supported the Armenians. Thus even though the Armenians were still involved in relations with the pope in Rome, their direct contact with factions among the Latin Crusaders was ongoing and Crusader influence at their court is visible through positive and negative political and military activity. Moreover, as Wilbrand of Oldenburg notes in the account of his visit to Cilician Armenia in 1211–12, there were Franks living there as part of the general population.[163]

Meanwhile for all the difficulties he had faced in the north, Bohemond IV had been reinstated as prince of Antioch in 1219, and he remained lord of the Principality until he died in 1233. Furthermore Bohemond saw it in his best interest to be on good terms with John of Brienne and the Latin Kingdom, partly to protect himself from the Armenians to his north. Even greater potential threats, of course, were the Seljuks and the Ayyubids, to the northwest and northeast, respectively, but fortunately for the Crusaders and the Armenians alike, these Muslims remained in constant conflict between each other in the 1220s. To the south, in the Latin Kingdom, King John of Brienne was the beneficiary of the eight-year truce with al-Kamil, a truce that did not extend to the northern Crusader States. He welcomed this respite from the required military operations of the past several years.[164]

At this point, following the story of the Fifth Crusade, the Paris Eracles again returns to the narrative of the developments related to King John. He set off in the fall of 1222 on a fateful voyage to the West. The Paris Eracles notes that John took with him his constable and the master of the Hospitaller Order, but the master of the Templar Order stayed behind.[165]

King John went west to seek aid for the Holy Land – financial aid and military aid in the form of manpower, as well as a husband for his young daughter. He was accompanied not only by Pelagius, who was on his way back to Rome, but also by the patriarch of Jerusalem, Ralph de Merencourt, and representatives of the Hospitallers and Templars. They arrived at Brindisi in October and went directly to Rome to see the pope. In the matter of a husband for Queen Isabel, neither the Paris Eracles nor Ernoul identifies who originated the idea, but in the wake of the death of Empress Constance, Frederick's first wife, in the summer of 1222, John and Honorius discussed the possibility of Isabel marrying Emperor Frederick II. Honorius liked the idea for various reasons, and he was willing to grant the necessary dispensation for the marriage, since the prospective bride and groom-to-be were third cousins. When the idea was proposed to Frederick, he agreed. We can only wonder what King John thought, given the implications of such a union for his position as the Latin king of Jerusalem. The notion that John had been assured that he would retain the regency for life seems naïve and unrealistic.[166]

Whatever the case may be, it was a fateful arrangement. Normally it had been the prerogative of the king of France to find a spouse for the queens of the Crusader Kingdom. John of Brienne himself had been chosen by King Philippe II Augustus. When King John traveled on to Paris to visit King Philippe, the French king was not pleased to hear the news about Frederick; perhaps he could somehow foresee the difficulties this would create for the Latin Kingdom. Nonetheless, when he died a year later, 23 July 1223, he maintained his generosity toward John of Brienne, granting him a princely sum to aid the Holy Land.[167]

The marriage of Queen Isabel to the Emperor Frederick II took place in two parts. First, Isabel, aged fourteen, was married by proxy in Acre in the Cathedral of the Holy Cross, with Bishop James of Capua standing in for Emperor Frederick. Then Isabel was taken to Tyre and, regarded to be of age, she was formally crowned queen as Isabel II. From there she sailed to Brindisi where the second ceremony took place on 9 November 1225. The marriage was celebrated with proper imperial pomp and circumstance with King John in attendance. However, after the ceremony, when Isabel and Frederick were man and wife, John of Brienne was no longer king of Jerusalem. Isabel was queen of Jerusalem and Frederick II was the king consort.[168]

THE ART OF THE CRUSADERS, 1210–1225

PILGRIMAGE TO THE HOLY LAND, 1210–1225

One of the new developments, which assists us in evaluating and attempting to understand the artistic activity of the Crusaders in this period and their cultural circumstances, is the return of Christian pilgrims to the Holy Land, in particular pilgrims who write detailed accounts of their visits.[169] There were no such pilgrims known by name between 1187 and 1210. We have only the chronicles of the Third Crusade, which briefly describe the pilgrimage made by soldiers at the end of the Crusade in 1192, an anonymous text – the "Estat de la cité de Jerusalem" – the author/artist of the Freiburg Leaf, and later chronicles like that of Gunther of Pairis describing the activities of Abbot Martin of Pairis on the Fourth Crusade. As we have seen, Martin visited sites like Acre and Tortosa, but does not describe his travels in any detail. By contrast there are two pilgrims of note between 1210 and 1225, namely, Wilbrand of Oldenburg, who traveled in the Holy Land in 1211–12 as a member of the imperial German delegation to Cyprus and Armenia, and Thietmar, a Crusader, whose visit to the Near East occurred in 1217, when the Fifth Crusade was getting underway.

Compared to pilgrims in the twelfth century, the thirteenth-century pilgrims have been little studied. There are several reasons for this. Partly it is because of the fact that there were fewer of them.[170] Partly it is because the old printed Latin editions of their work have until recently been more difficult to find and there are no modern critical editions. Partly it is because, again until recently, there have been no complete translations in Western languages, and no English translations in such collections as the Palestine Pilgrims Text Society, to help make their accounts more widely known.

In general we know that medieval pilgrims to the Holy Land during the time of the Crusades, 1098–1291, mostly came for devotional and penitential purposes, to visit and worship at the shrines and holy sites connected with the life of Christ and the saints, as well as certain important Old Testament sites. Only gradually and selectively did these pilgrims become interested in the *realia* of these sites in particular, and in life in the Latin Kingdom of Jerusalem more generally during the twelfth century. In the thirteenth century, the spiritual orientation of these pilgrims remained basically similar to that of their predecessors of the previous century. The fact is, however, that in the thirteenth century the attitudes of pilgrims toward the practical realities of the situation in the Holy Land began to change. Two reasons to help explain this are mentioned. The first has to do with circumstances in the Crusader States following the Third Crusade. Essentially, Crusader holdings were limited to the seacoast, and nearly all of the major holy sites were under Muslim control inland. The result was that visitors spent long waits in Acre, or in some other Crusader city along the coast, while arrangements were made for what usually turned out to be a very brief visit to the holy places. Because they were forced to experience this situation, they began to comment on the details of what they observed about it. The irony was that even though they began to be more interested in the practical realities of their visit, they had very brief exposure to the main holy sites in Jerusalem, Bethlehem, and Nazareth, and therefore they had relatively little to say about what they saw in those places. The second, more general reason has to do with an essential change in the "Weltanschauung," which produced a greater interest in sensory experience, in the concrete visible world, and in the larger world stretching to the Mongol East among Europeans during the thirteenth century. This change is partly the result of the Crusades themselves, and of the very phenomenon of pilgrimage, which stimulated travel and the knowledge of and interaction with new and different lands, peoples, and cultures.[171]

Wilbrand of Oldenburg and Master Thietmar appear at the beginning of the thirteenth-century developments. They are both from Germany, but they follow very different itineraries in the Holy Land. However, they reveal conditions and describe experiences that greatly assist us in understanding what life was like in the Crusader East at this time. Wilbrand was born of the noble Wettekindus family in Oldenburg, west of Bremen in northern Germany.[172] He was a well-educated clergyman who, at the time of his pilgrimage, was a canon of Hildesheim.[173] Later, when he returned to Germany, he transferred to Paderborn, and eventually he became bishop of Utrecht, in 1227. About Thietmar we know nothing except what can be learned from the content of his pilgrimage account written on the basis of his travels in the Near East in 1217.[174] Since, however, most pilgrims decided not to make the journey in person to the Near East for reasons of the high cost of the journey, it seems evident that most likely both Wilbrand and Thietmar were men of means.[175]

Just as Wilbrand and Thietmar are quite different as far as what we know about them is concerned, so also their reports are quite different, starting with the itineraries they follow. After Wilbrand arrives in the Holy Land at Acre on 25 August 1211, he notes first of all the strong fortifications with double walls and high towers on the landward sides, and the multicultural population of "Francos et Latinos, Grecos et Surianos, Iudeos et Iacobinos."[176] However, he points out that the Franks and the Latins, by which he means what we would call the French and the Italians, control the others. His normal account here and for all major cities provides a bit of history, something about the nature of the town and its population, special religious sites or objects of interest if any, its ecclesiastical official, and the location of the city relative to his last stop.

Leaving Acre Wilbrand sails north with several officials on business, going first to Tyre, also impressively fortified, then past Sarepta, and on to Sidon, where he notes there were few people living and the walls were destroyed. Finally he comes to Beirut where he has a long passage that includes detailed comments on the fortifications of the city and a description of the palace of the Ibelins.[177] It is this latter passage, referring to the coloristic decoration, the mosaic floors, the fountain playing in the courtyard, that evokes the Near Eastern character of aristocratic Frankish lifestyle in the Latin Kingdom that recent arrivals from the West found so remarkable. Wilbrand also says he saw in Beirut a miraculous image of Christ crucified that exuded blood and water.[178]

After resting in Beirut for two days, Wilbrand continues on past Gibelet, Batrun, Nefin, arriving in Tripoli after a terrible storm that leaves them almost shipwrecked. Tripoli is characterized as a rich city with many inhabitants, including Christians, Jews, and Saracens. From Tripoli, Wilbrand journeys past Crac des Chevaliers in the distance and Chastel Blanc, en route to Tortosa. Tortosa is a small city, Wilbrand says, where there is a small church, but a very important one. This church, which was then a cathedral, was the first church built and dedicated to the honor of the Virgin Mary.[179]

Leaving there, Wilbrand arrives at Margat on the coast just north of Tortosa. Here he gives an extended description of the castle, which belongs to the Hospitallers. It is not only the largest in the region with excellent defenses, but it also has a large garrison, which must have been as large as that at Crac – where Wilbrand says there were two thousand soldiers[180] – and it is the seat of the bishop of Valenia, the little town now destroyed and abandoned, on the bay just north of Margat.

From Margat Wilbrand mentions passing Saone, now a castle in the hands of the Muslims, and the city of Latakia, en route to Antioch. As with a number of other places along the way, he mentions them because they were important, but he did not visit them. Arriving at Antioch just as an eclipse of the moon was occurring, he praises the city as "good and firm," second only to Rome in holiness. He describes the walls and towers of this vast city, and notices that even though the exterior of the houses and palaces are rather dull and mud-colored, inside they are decorated with gold with pleasant living spaces. He notes that the population includes Franks and Syrians, Greeks and Jews, Armenians and Saracens.

Antioch had a special importance for Wilbrand personally, because of his German countrymen – even a relative – who were buried here. He says he saw the tomb of Frederick I in the Cathedral of St. Peter, which was the church of the patriarch of Antioch. He also visits an important monastery – formerly Orthodox, now Latin – dedicated to St. Paul, where he finds the tombs of the following persons: Burchardus, margrave of

Magdeburg; Ogerus, count of Woldemborg; and Wilbrandus, count of Halremunt, who was Wilbrand's uncle.[181] Wilbrand says that Frederick's tomb was a marble sarcophagus, obviously quite magnificent, but for the others there must have been tomb slabs with inscriptions, set in the ground, since this is what we commonly find for Crusader burials and he does not describe them otherwise. All of these tombs may have been done by Crusader sculptors and masons.

Wilbrand also mentions a number of churches in Antioch that he apparently saw or heard about. At the cathedral he mentions that the *cathedra* of St. Peter and his prison are on view. Nearby the cathedral was a completely round church dedicated to the Virgin Mary, which was very richly decorated, and which contained an image of the Virgin Mary revered by the Greeks. He says that when this icon was carried in procession, the Virgin would bring rain.[182] Up on Mount Silpius or at the foot of the mountain, Wilbrand also mentions the Church of St. Luke, built on the site of his house, a church dedicated to St. Barbara, a place where Mary Magdalene did penitence, a chapel where St. Margaret prayed before she was martyred, and a church built on the site of the house of St. John Chrysostomos.[183]

Wilbrand says that he stayed in Antioch for several days before moving on to Cilician Armenia. For this journey, he is apparently traveling by land, on horseback. He passes the castle of Baghras before entering Armenian territory, noting that the Armenians control it at this point, but the Templars are keen to get it back. He also notes the presence of the Teutonic Knights in Cilician Armenia.[184] His general remarks on Armenia are interesting because he comments that the population in this country included "Francis, Grecis, Surianis, Turcis, Hormeniis et reliquis," and that the Armenians governed.[185] This means that in his view, he finds a similar multicultural mix of peoples in Armenia as he found in the main Crusader cities. The main differences were that the proportions of the different groups varied, and here of course, the Armenians are in control.

Wilbrand's mission to Cilician Armenia takes him to numerous places on his way to Sis, but his exact route is unclear.[186] Clearly he is well informed about the many cities and towns he passes by or passes through en route. He notes interesting details about the various places, such as sites where shrines to important saints are located or notable works of art can be seen. The tomb of St. Pantaleon is found at Mamistra (Misis). In Tarsis (Tarsus) there is a church in honor of St. Theodore, who was martyred there. In Tarsis there is also the principal church dedicated to St. Peter and the Holy Wisdom, in which there is a much venerated statue, "cui imago domine nostre angelicis manibus est depicta."[187]

Wilbrand and his party arrive in Sis for the feast of Epiphany, 1212. There they participate in the liturgy of the day at the invitation of Raymond-Roupen. After conducting their business there, Wilbrand travels from Sis to Silifke on the Mediterranean coast, where he takes a ship for the trip to Cyprus. As he tells us, the Latins control Cyprus, but they only have an archbishop and three suffragan bishops, whereas the Greek Orthodox have thirteen bishops and one archbishop. After arriving in Kyrenia, he travels to Nicosia. Again his trip is marked by visits around the country, but as in Cilician Armenia, his account records information about places that are not obviously in a logical sequence relative to where they are located, in this case, on the island. He mentions Limassol, Paphos, and Famagusta in that order, before returning to Acre.

On his return to the Latin Kingdom, Wilbrand makes his way to Jerusalem by way of Haifa and Mount Carmel, down the coast past Caesarea and Arsuf to Jaffa. From Jaffa he went to Ramla, the place from where St. George originated, with the result that the Franks call him "St. George of Ramla."[188] Moving farther inland he passes Beit Nuba until he perceives his first glimpse of the Holy City. In his otherwise quite matter-of-fact narration, here he allows himself an expression of emotional fulfillment, a vision of Jerusalem that inspires in him joy and admiration.[189]

As Wilbrand arrives at the walls of the city, he notes that Christian pilgrims such as himself are compelled to enter through a stable, near where the martyr Stephen was killed. This description corresponds exactly with the text of "L'Estat de la Cité de Jérusalem,"[190] which locates the gate of St. Stephen on the north side of the city. Next to that was the Asnerie of the Hospitallers, the Hospital for the lepers, and the postern gate of St. Lazarus.[191] Because the Muslims would not let the pilgrims lodge inside the city, they used the Asnerie for sleeping accommodations. In addition to the restrictions that the "Cité de Jérusalem" mentions, Wilbrand notes that the city looked desolate, and before they were allowed to enter, they had to pay "octo drachmas et dimidiam."[192] Wilbrand mentions this payment, but the "Cité de Jérusalem" does not.[193] He also says that he entered inside the walls, not at the postern gate, but at the David portal near the Tower of David on the west side of the city.

Wilbrand goes into the city of Jerusalem and first enters the Church of the Holy Sepulcher "cum timore et gaudio," to visit the aedicule of Christ, the "Monumentum Dominicum."[194] Examining the aedicule, he points out that it is here that the holy fire descends on Easter night. He describes the hill of Calvary as very near and identifies the site of the Crucifixion, where the blood of Jesus fell on the rock, and where the Virgin and the other women stood by the cross. Close by also is part of the column of the Flagellation.

At this point, Wilbrand mentions that the Church of the Holy Sepulcher is in the hands of four Syrian clergy who are not permitted to leave. He says that the Muslims have left these holy places intact, in his opinion more by divine will than their benevolence! He goes on to exclaim over the rich decoration of this church covered with marble and with many golden images.[195] Finally, he notes that the tombs ("marmoreis sarcophagis") of the Latin kings of Jerusalem are seen near the entry to the choir, that the center of the world is located in the center of the choir marked by a circle, and that he saw the Chapel of St. Helena. Having completed this visit, he is permitted to leave the city by the David portal, apparently without being allowed to see any other holy sites inside the walls of Jerusalem.[196]

Wilbrand completes his visit here by walking around the north side of the city, past the gate of St. Stephen, to the Valley of Jehosaphat and the Mount of Olives east of the city walls. There he sees the place where Jesus was betrayed in the garden, and visits the little church, known popularly as "Sanctum Pater Noster." This appears to be the Church of the Savior in Gethsemane.[197] Wilbrand also visits the Tomb of the Virgin nearby. He remarks on the tomb of "uirgineo marmore," and notes that here also, there are Syrian clergy, who, although subject to the Muslims, preserve the sacredness of this place.

Although Wilbrand comments at this point on how close Bethlehem is to Jerusalem, he is not able to visit the Church of the Nativity. First he turns east and goes up the Mount of Olives to Bethphage, where he sees two destroyed monasteries.[198] He also notes the wonderful view of the city from the Mount of Olives, where he can see what he could not visit in Jerusalem, namely, the *Templum Domini* and the *Templum Salomonis* inside the Haram al Sharif. Then he crosses the Valley of Jehosaphat and goes up on Mount Sion at the southwest corner of the city, where he visits the Coenaculum. Again here he finds Syrian clergy in charge of the holy site. This is the site of the Church of St. Mary Mount Sion; Wilbrand calls it a "largum et pulchrum aspectu cenobium."[199] He notes the important events that took place here: the Last Supper and the descent of the Holy Spirit at Pentecost, and it was at this site that the "felix et immaculatum" body of the Virgin Mary reposed before her assumption into heaven from her tomb in the Valley of Jehosaphat.

Leaving Mount Sion, Wilbrand goes to Bethany where he says two churches were preserved by the Muslims: one on the site of the house of Simon the leper, and the other in the garden of Mary and Martha in which the tomb of Lazarus is found.[200] From Bethany Wilbrand takes the Jericho road, which he describes as truly difficult and dangerous – especially without the Hospitallers or the Templars to patrol it – with many thieves along the way. He comments that Jericho is a small town, where nearby Zacchaeus climbed a sycamore tree in order to see Jesus. He does not actually mention seeing the house of Zacchaeus.[201]

Wilbrand's final visit is to the site where Jesus was baptized in the Jordan by John. He describes the river as deep with fast-moving water, certainly a far cry from what we see today. The church at this site was largely destroyed. From here he goes to the shores of the Dead Sea, which he describes as "stagnum fetidissimum infernalis nigredinis, tetrum habens odorem." From there he returns to Jericho, and presumably to Acre, but his account ends at this point.[202]

Wilbrand is a pilgrim of some importance whose experience reflects the reality of what it was possible – and not possible – to see and do in these years for Christians trying to come to the holy places in the early thirteenth century. Obviously his visit focused on the Church of the Holy Sepulcher, but he was very limited in what he was able to see outside of this, he had very limited time to make his visit, and he had to pay to enter Jerusalem. Essentially he was apparently guided to those sites served by Syrian Orthodox clergy who were allowed to function for the benefit of Christian pilgrims. The main sites were, besides the Church of the Holy Sepulcher, the Church of St. Mary Mount Sion and the Tomb of the Virgin. He seems well informed about the places he is allowed to visit, but he is not very expansive about the holy sites compared to the much longer accounts written by pilgrims to Crusader Jerusalem before 1187, including earlier German pilgrims like John of Würzburg and Theodorich. This result is apparently caused by the shortness of his visit to the Holy City and the rapidity with which he had to move from place to place when he got there.

Our second pilgrim is also German, known as Magister Thietmar. He comes to the Holy Land five years after Wilbrand, in 1217.[203] Based on what he says, Thietmar is traveling as a Crusader, ". . . cruce Dominus signatus"; he is not on official business, unlike Wilbrand. Not only his station in life is therefore quite different, but also the itinerary that he follows differs significantly from that of Wilbrand. His route through the Holy Land does not follow the routes taken by Wilbrand, and apparently being quite adventuresome, he visits a number of remarkable places to which Wilbrand did not go. In particular, he visits Damascus, where he also sees the miraculous icon of the Virgin Mary at Saidnaya nearby, and the Monastery of St. Catherine's on Mount Sinai, among other interesting places. He on the other hand does not visit Cilician Armenia or Cyprus as Wilbrand did.

Thietmar begins his account by telling us what we know about him: "Ego,[204] Thietmarus, in remissionem peccatorum meorum cruce Domini signatus et munitus cum preregrinis meis."[205] On the basis of this we can see that he is a Crusader and well educated. Based on later parts of his introduction, we can imagine that he is undertaking this expedition with a group of other men, probably also Crusaders. His name and certain evidence of his knowledge of Germany evident in his account indicates that he is German.[206]

He arrives in Acre apparently in the early summer of 1217, presumably with one of the first contingents of the Fifth Crusade. He says he has to wait a month in Acre because negotiations are underway between the Crusaders and the Muslims over the current truce.[207] This suggests that Thietmar arrived on the spring *passagium* and that he proceeded on his travels before the first actions of the Fifth Crusade got underway in the fall of 1217. He starts his visit to the Holy Land leaving Acre with some Syrians and some Muslims ["Surianis et Sarracenis"] who go into Galilee. There he visits Sephoris, the birthplace of St. Ann; Nazareth, where the Annunciation took place; Cana, where Christ changed the water into wine at a marriage feast; and Mount Tabor, where Jesus was transfigured. He mentions a church at Cana and one on Tabor – but not the churches at Sephoris or Nazareth (!?) – and says that the Muslims had occupied Mount Tabor and built strong fortifications there.

After visiting the towns around the Sea of Galilee, he unceremoniously travels on to Damascus where St. Paul was converted.[208] Apparently easy passage into Muslim territory by Christian pilgrims was fairly standard, so that here and elsewhere later on, when he crosses into Muslim-held territory, there is no mention of any special arrangements that have to be made for safe passage. Although it is clear that Christian and Muslim merchants and tradesmen must have been making trips between Damascus and Acre on a continual basis in the name of commerce, it is not clear what pilgrims needed to do to make such travel possible, and what kind of escort they would need both to establish their identity and purpose and to ensure their personal safety. Thietmar only refers to a "ductori" from time to time, that is, a guide, presumably a local person in Damascus and on Mount Sinai. He must have been a kind of dragoman, who functioned as both an interpreter and guide.

Damascus is obviously very interesting to Thietmar and he goes there with no mention of special arrangements. He says, however, that it is the custom to pay a tithe in order to enter the city. Thietmar expresses open and frequent admiration for what a rich and beautiful city it is, with very little fortification – so very different from the heavily defended Crusader cities that he has seen and will see. He speaks of the lovely flowers and birds in the city, the customs of the people, and the Muslim religion. He says there exists a large and beautiful church built by the Greeks and dedicated to St. Paul, which the Muslims converted into their mosque, presumably the great mosque. He also remarks on the palace of the sultan, which is large and well built. In the course of his stay, Thietmar, showing remarkable awareness and curiosity, wants to see the Christian prisoners held by the sultan, but his guide says they cannot be visited. Nonetheless he recognizes a number of prisoners during his exploration of the city, including two Germans, one from Wernigerode and one from Quedlinburg.[209] Finally he remarks with some wonder that people in and around Damascus were able to follow their own religion freely, and that there were many Christian churches in the city. All this is observable because he is able to stay in Damascus for a week.[210]

While he is in Damascus, Thietmar apparently visits the nearby monastery of Saidnaya where the miraculous icon of the Virgin Mary is found.[211] Although this portion of Thietmar's account is not contained in certain manuscripts, the Laurent edition includes his discussion about Saidnaya, which runs to something over four printed pages, the longest description of an individual item in the entire text after his visit to St. Catherine's on Mount Sinai.[212] He describes the advent of the miracle-working icon in detail and discusses its special properties. In particular he describes the phenomenon of the emission of holy oil ("liquor") from the breasts of the Holy Virgin, a miraculous fluid that could heal the sick.[213]

After his visit to Damascus and the environs, Thietmar reports that he travels much farther to the east. Surprisingly, not only does he not return immediately to Acre and to Crusader-held territory, but also he travels far across the Syrian desert to the seat of the caliphate in Baghdad! Baghdad is described as large and heavily fortified, and the caliph is compared to the pope. However, relative to Damascus, he has very little to say about Baghdad, and he returns directly to Acre thereafter. Strangely, he has nothing to say about the great expanse of desert he must have covered or the great rivers of the Middle East, the Euphrates and the Tigris, which he presumably would have seen and crossed. Even though Christian pilgrimage into Muslim-held territory was a standard practice, the fact that he has the freedom to travel so widely in Muslim territory suggests that he left Acre with certain credentials that he does not tell us about. Also, as noted earlier, he must have had some kind of qualified Arabic-speaking guide or escort who could arrange the practicalities for his passage to these major Muslim cities without difficulty.

Back in Acre he prepares to make his pilgrimage to Jerusalem, but also says how much he wishes to see the tomb of St. Catherine, which also exudes holy oil. He travels rapidly down the coast, mentioning many sites along the way,[214] turns inland at Ramla and Lydda, and arrives at the St. Stephen gate of the Holy City. In contrast to Wilbrand, his first comment about Jerusalem is on how heavily it is fortified.[215] Interestingly, he begins his account of Jerusalem with the "*Templum Domini*, quod dicitur Salomonis, mirifice adornatum."[216] Even though no Christians were allowed to visit the Dome of the Rock at that time, then as today it is the most striking visual monument in the Holy City. Then he mentions the Church of the Holy Sepulcher and the other places of the Passion. He points out that they are all without lamps, are without honor or respect, and are closed except when they are opened for the offerings of pilgrims.

Elsewhere around Jerusalem, Thietmar reports only about places outside the walls of the city, on Mount Sion – sites in the Church of St. Mary Mount Sion, but nothing about the church itself – and in Gethsemane on the slope of the Mount of Olives. Oddly enough, Thietmar gives very little information on any of these places, suggesting that those he may have seen he had to visit very quickly.[217]

After spending two days, one night, in Jerusalem, Thietmar goes to Bethlehem. There he describes the church as extremely beautiful with marble architraves and capitals, marble pavements, and walls decorated with gold, silver, and colors. He mentions the grotto of the Nativity, and the other main sites such as the cell of St. Jerome and the place where the holy innocents were buried. Even though he tells us much more about the Church of the Nativity than what he had to say about the Church of the Holy Sepulcher, it is still a remarkably brief report. Overall, it seems that Thietmar's account clearly suggests that the accessibility of the holy sites by Christian pilgrims was somewhat diminished compared to what Wilbrand had to say, and that the sites themselves had to be visited extremely rapidly. Thus all we seem to hear about is a general impression of the church and a list of some of the main sites inside.

After mentioning many sites in the environs of Bethlehem, Thietmar heads south toward Sinai by way of a winding route. He apparently goes first to Hebron to visit the tomb of the patriarchs.[218] Then he doubles back to go down to Jericho[219] and the Jordan River, to the site where Jesus was baptized, where he mentions a "pulchra ecclesia in honore sancti Iohannis baptiste."[220] From here he goes south to the Dead Sea and into the territory of Moab on the east bank, where he mentions a number of biblical events and sites from the Old Testament.[221] As he travels south he mentions passing the castles of Kerak[222] and Shaubak,[223] now in Muslim hands. He continues through the wilderness of Edom past Mount Hor to the Red Sea (Gulf of Aqaba),[224] and then on to St. Catherine's Monastery at Mount Sinai.

In contrast to his comments on the Holy Sepulcher and the Church of the Nativity, Thietmar's discussion of St. Catherine's is long and discursive with a description of Mount Sinai as well.[225] He notes that there is a bishop here with the monks, who are Greek and Syrians, and that the monastery was well fortified. The church is "magnam et principalem," where there are services day and night, which he mentions. He describes the refectory and the food the monks eat. He particularly describes the Holy Chapel of the Burning Bush, where everyone – bishop, monk, Christian, Muslim – worships discalced, as Thietmar says he did. The bush itself has been "pro reliquiis distractus," that is, dispersed as relics. However, he describes a golden bush that has been put in its place, golden as if on fire, with the likeness of the Lord above or upon ("super") the bush and Moses standing on each side of the bush: to the left removing his shoes, to the right barefoot. There is no golden bush like this in the chapel today, only the remains of a desiccated bush and icons of the event elsewhere in the church. Thietmar could also have seen icons of this event, examples of which are extant in the church.[226] He also mentions that images of the bush are found on stones dug up from this site as if painted on them, and these stones are effective against diverse infirmities.

He then discusses the tomb of St. Catherine, which he had said he wanted to visit from the time he first arrived in the Holy Land. The tomb, which he notes is quite short because Catherine is small, is located in the church on the south side of the choir. During his visit the bishop allowed Thietmar to look into the tomb where he saw the *corpus* and could kiss the head of the saint.[227] Looking inside the tomb he could also see the holy oil that emanated from the corpus of the saint. At this point Thietmar launches into a long discussion on St. Catherine and how angels miraculously transported her body to this holy site.[228]

After his visits to the church, including the chapel and the tomb, and the monastery, Thietmar is guided up to the top of Mount Sinai.[229] Thietmar describes the trip in detail, noting details about the stairs, the sanctuaries visited,[230] and in general describing his experience at length. This whole discussion about his visit to St. Catherine's Monastery illustrates the fact that when he visited a holy site where he could move around slowly and reverently, seeing what he wanted to see, praying and meditating on the meaning of the sites, his account could be very full and informative of his personal experience. He does not tell us exactly how long he was at St. Catherine's Monastery, but it obviously must have been for several days, one can imagine even a week or ten days. This is the longest account of any part of his visits while on this trip.

While he is at St. Catherine's, inspired by the views from the top of Mount Sinai where he stayed for three days, Thietmar describes what he knows of Egypt.[231] We note in particular that the information Thietmar gives at this point about the Nile is quite basic, namely that the Nile starts flooding in July for a period that lasts about forty days.[232] What Thietmar reports as a pilgrim is straightforward information that clearly any educated person might know; it certainly did not depend on special military intelligence. How then was it possible that the leaders of the Fifth Crusade did not know what this famous annual phenomenon of the Nile would mean for their military operations a few years later? Thietmar also comments on the three main cities of Egypt: Cairo, Damietta, and Alexandria. He notes that there are many Christians in Egypt, and many churches, and that there is a patriarch who resides in Alexandria. It is worth noting that the Laurent edition of 1857 does not include the details of his discussion of Alexandria, which is, however, found in the manuscript used for the Tobler edition of 1851, published by Sandoli.[233] Finally, Thietmar also includes a section discussing Mecca and the tomb of Muhammed.

After his time on top of Mount Sinai, Thietmar returns to the monastery for another four days. When the bishop sees that it is time for him to depart, he gives him a container of oil from the tomb of St. Catherine. Taking his leave, Thietmar succintly describes his return journey in one sentence![234]

Thietmar's account ends with several pages of information on the lands and peoples of the Holy Land, both Christian and non-Christian. He also lists the trees found in the Holy Land, and then he describes the structure of the Latin ecclesiastical organization and the clergy of the two main holy sites in Jerusalem.[235] By this appendix as it were, Thietmar demonstrates his awareness of the multicultural complexity of the Near East in terms of its Christians. We can use it as an index of the partial knowledge that some pilgrims to the Holy Land might have of the Christians he or she might encounter. For example, Thietmar mentions the following Christians: Latins, Greeks, Syrians, Jacobites, Georgians, Armenians, and Nestorians. He omits, however, any mention of the Copts, the Ethiopians, or the Maronites, all sects that the late-twelfth-century pilgrim, John of Würzburg, cited.[236] Furthermore, when Thietmar cites the four patriarchs of the East in rank order – Constantinople, Alexandria, Antioch, and Jerusalem – it is not clear whether he means Latin or Orthodox patriarchs, although every indication is the former. There was not, however, a Latin patriarch of Alexandria during this period.

The most remarkable aspect of Thietmar's account from the point of view of the Latin Kingdom is that even though he is a Crusader, he never mentions the Fifth Crusade in the course of his long account. It is, however, evident that the various manuscripts of Thietmar's text differ in wording and even in content, and that his name, "Magister Thetmarus"[237] or "Thietmarus,"[238] appears spelled differently and in different locations in these manuscripts. Reiterating the obvious, it is clear that a modern edition of Master Thietmar's important pilgrimage text is a major desideratum. Further study may also shed light on who he was and why he was so disinterested in the current Crusade, in which he was presumably participating.

The experiences of these two pilgrims, Wilbrand of Oldenburg and Master Thietmar, give us an invaluable glimpse into the Holy Land that we otherwise do not have from the written sources in this period, from 1210 to 1225. Nonetheless it is surprising how little the pilgrims have to say about the main holy sites they visit, in Jerusalem, in Bethlehem, and in Nazareth. Although their accounts are important for the special information they convey, it is still true that the text of "L'Estat de la Cité de Jérusalem" remains our most important descriptive narration about the Holy City. We cannot say exactly when that account was written, but it was most likely before 1212, when Wilbrand came to Jerusalem, as we have indicated earlier. Finally, what Wilbrand and Thietmar affirm, however, is that the holy sites were preserved and mostly shut down for protection when Christian pilgrims were not there to visit. However, there is no evidence of any artisitic activity at these sites, and the liturgical ceremonies seem to have been minimal as carried on by the Syrian Orthodox clergy allowed to remain in those special sacred places.

The other two figures of note in this period were, of course, the bishop of Acre, Jacques de Vitry, and Francis of Assisi. Both of them came to the Holy Land at this time; neither of them apparently visited Jerusalem or the other major dominical holy sites.

In regard to Jacques de Vitry, we have already observed that in 1217, Jacques de Vitry embarked on a preaching campaign in the Crusader States during which time he visited certain pilgrimage sites under Crusader control, most notably the shrine of the Virgin in the Cathedral of Notre Dame in Tartus.[239] Jacques de Vitry includes a description of the Holy City in his section on the history of Jerusalem in the *Historia Orientalis*.[240]

However, the fact is that even though he apparently wrote both volumes of his *Historia* in the years between 1219 and 1225, everything in his text on Jerusalem essentially reflects the state of the holy sites before 1187.[241] He does not seem to know the pilgrim's accounts of Wilbrand of Oldenburg or Master Thietmar. It is perhaps surprising that no evidence points to a visit to Jerusalem by Jacques de Vitry, but his known activities as bishop of Acre left him little time for such a pilgrimage. After his arrival in the Holy Land and his preaching campaign, he accompanied the Fifth Crusaders to Egypt in 1218–21. After this he went to the West in 1222–3 for consultations with the pope, and in 1225/6 he left Acre to return to Europe for good.[242]

The situation with Francis of Assisi was different. After his confrontation with the sultan in Egypt in 1219, Francis remained in camp with the Crusaders for some months, although the date of his departure is a matter of considerable debate. When he leaves Damietta, the Paris Eracles says that Francis went to Syria and then returned home.[243] About this Roncaglia writes:

> The date of his departure from Egypt for Syria is not known, though some set it as far back as February 1220. Probably in view of his being able to satisfy his Christian piety, he asked for and obtained from the Sultan of Egypt a 'signaculum', a kind of permit, enabling him, along with his companions, to go on pilgrimage to the Holy Places. This particular is referred to in documents of the fourteenth century, somewhat too late, therefore. But, nevertheless, it seems that this can be admitted, at least for psychological reasons, that St. Francis visited the Holy Sepulchre. What causes perplexity is that so interesting an item has escaped the first biographers.[244]

Thus even though the story that St. Francis went to Syria is reported in the Paris Eracles, we know nothing about where he went, and the idea that he visited the Holy Sepulchre is entirely based on later tradition found only in texts from the fourteenth century and thereafter.[245] There is no early text, that is, from the years 1219 to 1300, that records this "event," and no tradition that Francis visited Jerusalem is reflected in the painted cycles of his life up through the time of Giotto.[246] Unfortunately Francis did not himself keep a diary about his travels, which has come down to us.

In sum, Jacques de Vitry and Francis of Assisi are figures of major importance, but they do not apparently visit the main holy sites. Furthermore, Wilbrand of Oldenburg and Master Thietmar are also major pilgrims whose experiences are quite revealing about how pilgrimage to the Holy Land had changed after 1187. Compared to the most detailed accounts in the twelfth century written also by two Germans, namely John of Würzburg and Theodorich, Wilbrand and Thietmar follow different itineraries, spend less time at the holy sites they are able to visit, and are unable to visit many lesser holy sites, because of the fact they are under Muslim control. Most importantly by way of contrast, whereas the twelfth-century German pilgrims describe the holy places they visit in extensive detail, the two pilgrims of 1212 and 1217 can describe very little about the main holy sites apparently because of how rapidly they are forced to visit these places. However, it is remarkable that Wilbrand and Thietmar are able to visit places twelfth-century pilgrims do not write about in any detail, such as Damascus, Saidnaya, and St. Catherine's Monastery on Mount Sinai.[247] Furthermore, they include a wealth of information about the Muslims that reflects a new awareness and understanding about Islam that only a Christian observer open to the wonders of the Near East could convey. Thietmar obvously has more to say in this regard than does Wilbrand, presumably reflecting the fact that the former was a layman and the latter was a member of the clergy.

CRUSADER ARCHITECTURE AND ARCHITECTURAL SCULPTURE IN THE CRUSADER STATES, 1210–1225

We have seen in passing that the architectural activity from 1210 to 1225 in regard to major Crusader fortifications was comparable to and apparently as intense as that found in the previous period, 1192–1210. That is, we have noted that certain Crusader cities and castles had their walls taken down by the Muslims, and subsequently some of these sites had had their walls rebuilt by the Crusaders. However, unlike the earlier period, some new city walls were apparently put up or at least started, and certainly a new castle, Chastel Pelerin, was erected during these years, 1210–25. What is the evidence?

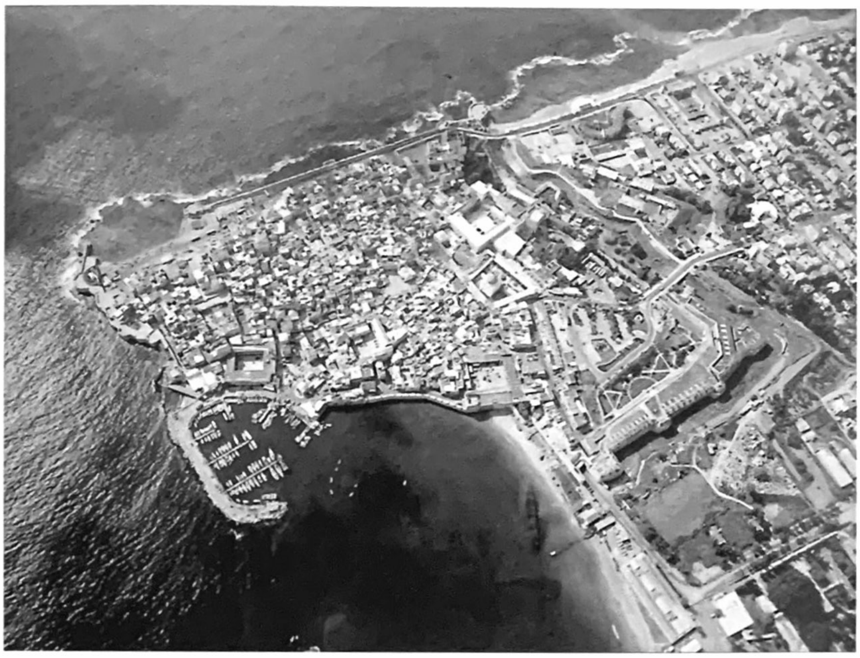
It is a remarkable fact that, as Pringle has pointed out, whereas almost all Crusader cities had some kind of defensive structure to rely on for their protection, that is, a citadel, a castle, a refuge tower, or some fortified building complex, like the Church of the Nativity at Bethlehem, only fourteen towns in the Latin Kingdom are known to have had full circuits of stone-built wall defenses.[248] These towns were Jerusalem, Tiberias, and Banyas inland, Ascalon, Jaffa, Arsuf, Caesarea, 'Atlit, Haifa, and Acre along the southern coast, and Iskandaruna, Tyre, Sidon, and Beirut on the northern coast. The towns with a full system of walls have certain things in common. First, most of them are located on the coast. Second, most were major urban centers; only 'Atlit is an exception. Third, most of these towns already had walls when the Crusaders captured them, even if they were damaged or partly destroyed.[249]

North of the Latin Kingdom of Jerusalem, there were also fortified cities in the County of Tripoli and the Principality of Antioch. Of these, the main sites were Gibelet (Byblos or Jbail) and Tripoli in the County of Tripoli, and Tartus (Tortosa) and Antioch in the Principality of Antioch. Again most of these cities were along the coast, except for Antioch, most were major urban centers, and certainly most had important fortifications that dated from before the time the Crusaders had arrived in Syria-Palestine.

With these points in mind, it is remarkable that two of the Crusader cities received entirely newly built city walls, namely Acre and 'Atlit, in these years. Furthermore it is notable that, although the exact dates of the construction of these new walls are not known or agreed on by all, the work on both of these new fortifications appears to have begun between 1210 and 1225.

St. Jean d'Acre (Maps 8A and 8B; Fig. 61)

In the case of Acre, the new walls in question were built on the northern side of the existing circuit to enclose the suburbs



61. Acre, Aerial Photo (1994). (photo: after Kedar, by courtesy of M. Milner and Y. Salomon)

known as Montmusard. Montmusard was a new part of Acre located adjacent to the northern twelfth-century wall. Its new wall ran from a point just east of the *castellum* at the gate of St. Anthony to a point on the coast about 800 meters north of the wall, forming a triangular suburb. David Jacoby has argued that this new wall was referred to by the pilgrim, Wilbrand of Oldenburg, in the following passage:

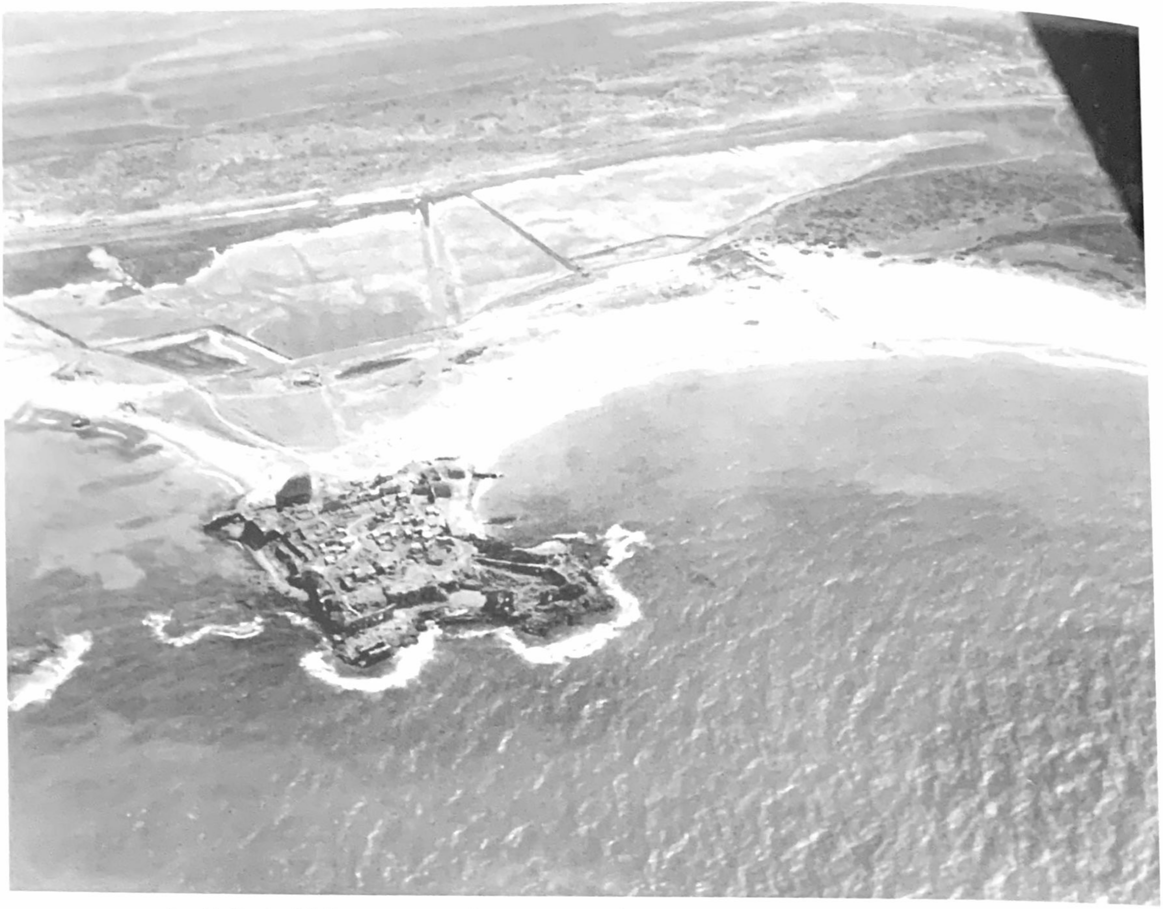
> This is a fine and strong city situated on the seashore in such a way that while it is quadrangular in shape, two of its sides forming an angle are girdled and protected by the sea; the other two are encompassed by a fine, wide and deep ditch, stone-lined to the very bottom, and by a double wall fortified with towers according to a fine arrangement, in such a way that the first wall with its towers does not overtop the main [second] wall and is commanded and defended by the second and inner wall, the towers of which are tall and very strong.[250]

Jacoby's major point is that in 1212 Wilbrand saw Acre with a system of double walls on the landward sides to the north and the east. Since the second [outer] wall of the double-wall system on the north side can only refer to that of Montmusard, he argues that this wall must have been built by 1212, in fact shortly before 1212.[251] The problem of what Wilbrand means in describing the city as "in dispositione sit quadrangula" seems to be less important, because different authors from the time of the Third Crusade on variously refer to the city either as triangular or quadrangular in shape.[252] The shape is clearly neither exactly, if we look at the early fourteenth-century maps of Acre published by Jacoby.[253] Furthermore, we cannot resolve this problem completely until we know exactly where the actual line of the walls for Montmusard is located by archaeological evidence. Nonetheless, Pringle proposes that the location of this line of walls for Montmusard is closer to resolution now, because of the identification of a round tower some 800 meters north of the present city walls, possibly the tower terminating the walls at the northeast corner of the city as shown on the fourteenth-century Italian maps.[254]

As for the date that the new walls of Montmusard were built, it is clear that the walls of Acre would have had to be repaired after the great earthquake of 1202 when the fortifications at Acre suffered serious damage. Once those repairs were carried out, it may have been possible to turn to the large project of putting up walls, de novo, for the Montmusard suburb north of the city. It appears that it was the early stage of these walls that were built by 1212, based on Wilbrand's description given above, but they may not yet have been as massive as the earlier city walls. Thus, Pringle points out that it is precisely the Montmusard walls that King Louis IX spends his time working on in 1251, to improve the fortification system of the city.[255] In fact, if Wilbrand's text is accurate, it may be that the Montmusard wall put up before 1212 was a single wall defining the outer perimeter with its ditch, and that what Louis IX mainly constructed at Acre was the second wall of the double-wall system seen on all of the fourteenth-century maps.[256] Defining just exactly which were the walls put up later, the inner walls or the outer walls, is a task the archaeologists will have to verify. Either is possible; Frankel favors the idea that the outer walls were built first.[257]

'Atlit and Pilgrims' Castle (Figs. 62–69)

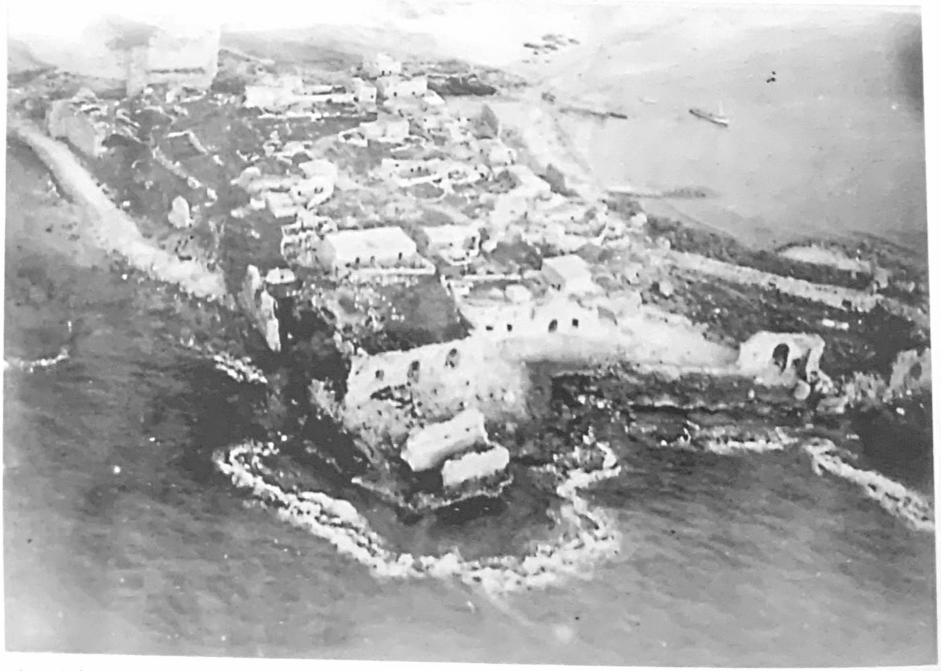
The other set of new Crusader city walls is found at 'Atlit, where the great castle was built in 1217–18 that was then given to the Templars. Pringle suggests it is likely that the town adjacent to the castle of Chastel Pelerin received its walls after al-Mu'azzam's attack on the fortress in the fall of 1220. He proposes to date these new walls to *c.*1225–50. Although not as formidable as the walls of the castle itself, they were impressive



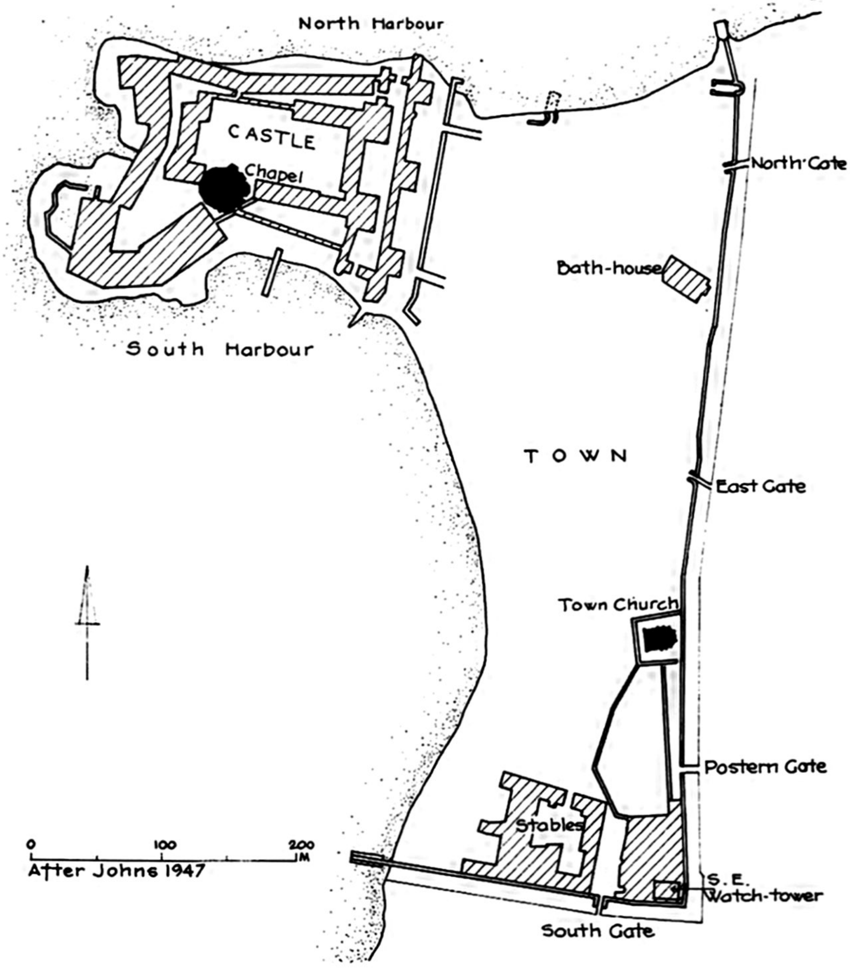
62. ʻAtlit: Aerial Photo, *c.*1930 (photo: courtesy of the Palestine Exploration Fund, London)

nonetheless (Fig. 64). Pringle provides a succinct description of their current condition:

> The town was defended by the sea on the north and west, and by the castle on the north-west. To landward it was enclosed by a wall some 645 m. long on the east and 230 m. on the south, giving an inhabitable area of 9 ha. The wall survives at least 7.25 m. high, measuring from the bottom of the ditch in front of it, and is built, like the castle, of massive limestone blocks with course heights of 0.75 m. and lengths averaging



63. ʻAtlit: Aerial Photo, WWI (photo: courtesy of Benjamin Z. Kedar, and the Gustaf-Dalman-Institut, Ernst-Moritz-Arndt-Universität, Greifswald).



64. ‘Atlit, Chastel Pelerin, Plan of castle and town. (photo: after Pringle, *Churches*)

2.55 m. It had two gates and a postern leading into the ditch on the east side, and one gate on the south. The main gates were set in gate-towers, only the southern of which projected forward from the wall.[258]

The north and south main gates were defended differently from the east gate, but they all probably had slit-machicolations; however, their towers do not survive to a point high enough for us to tell for sure. There were timber bridges set across the ditch in front of these gates. At the ends of the walls there were rectangular towers built in the sea to protect them, and there was also a rounded tower to guard the entry to the ditch at the north end of the beach.[259]

It is clear from the excavations carried out by C. N. Johns at ‘Atlit in the 1930s that construction of the town and its walls went on for a period of time, mostly in the second quarter of the thirteenth century, as Pringle indicates. However, Johns also has some comments of interest when concluding his report on the excavation of the stables:

> The evidence of the coins suggests that the building [stables] was in use for something like seventy years, almost as long as the castle itself remained in Crusader hands (1217–1291). If so, it must have been one of the first works to be undertaken in the suburb. It was not the very first; both the south-east watch-tower and the town wall preceded it. Yet the town wall itself can hardly have been built before the twenties. Neither the Crusaders who began the castle in 1217, before leaving for Damietta, nor the Templars who took it over afterwards can have had the time or the means for anything but the castle if they had already made it strong enough to resist attack in 1219 or 1220.[260]

Thus it appears that it must have been shortly after the Templars successfully defended this castle from al-Mu’azzam in 1220, when construction could have begun on the city walls. In the wake of appeals to the West for funds from the Templars, for aid to assist them in defending their holdings, it seems likely that the town walls at ‘Atlit could have been substantially begun between 1222 and 1225. This construction would then have been underway less than ten years after the main castle itself had been constructed.

The castle at ‘Atlit is one of the largest and most impressive new castles built by the Crusaders in the thirteenth century (Fig. 65).[261] Boase called it “one of the most splendid and significant undertakings of the crusading revival.”[262] It is located on a sandstone promontory, which has a sharp drop-off to deep water on three sides. (Figures 62 and 63) Inside the later city wall system, it is protected from the landward (east) side by a ditch at sea level, with a masonry counterscarp in front. Behind this is a massive double-wall system, with three projecting rectangular towers on the first wall and two larger and more massive towers on the second wall.[263]

65. 'Atlit, Chastel Pelerin, Plan of castle. (photo: after Johns)

Oliver of Paderborn discusses its construction at some length, as we have mentioned previously.[264] Soldiers of the Fifth Crusade built it in the winter of 1217–18, led by Walter of Avesnes, a Fleming, and assisted by men of the Templars and the Teutonic Knights. It was erected on an ancient Phoenician site, and the Crusaders used masonry from that site, including some of the largest stone blocks employed for any Crusader fortification. Oliver says that a single one of these blocks could hardly be pulled by two oxen. The castle was never taken by the Muslims, neither by al-Mu'azzam who attacked it twice, in the winter of 1219–20 and the fall (October – November) of 1220, nor later by Baybars in 1265, but it is in ruins today.[265] After the Templars evacuated it in 1291, it was eventually damaged by an earthquake in 1837, after which Ibrahim Pasha removed large amounts of its masonry to construct the sea wall at Acre. Study of the site began in 1922 during the time of the British Mandate, and serious excavations were carried out here by C. N. Johns between 1930 and 1934, but were never completed.

Besides its massive defensive system, and the impressive masonry, the castle of 'Atlit is notable for its remarkable "round" church, and certain architectural sculpture. Only the foundations of the church remain, and the sculpture that survives is severely damaged by weathering. However, both represent new departures in the artistic activity of the Crusaders in the thirteenth century.

The chapel, or *oratorium*, whose ruins we see today is a remarkable polygonal, triapsidal structure, which seems to have had gothic rib vaulting with a central pier (Fig. 67).[266] This design for a castle chapel is no doubt a reflection of the *Templum Domini* in Jerusalem, and it reminds us of chapter house architecture in the West, as well as surviving churches in northern Spain – without the central pier to carry the vaulting – at Eunate and Torres del Rio.[267] In fact, however, as Pringle points out, the surviving evidence about this chapel, mostly in the form of column bases, compares stylistically to work done in France in the 1250s. Other sylistic considerations also suggest a date

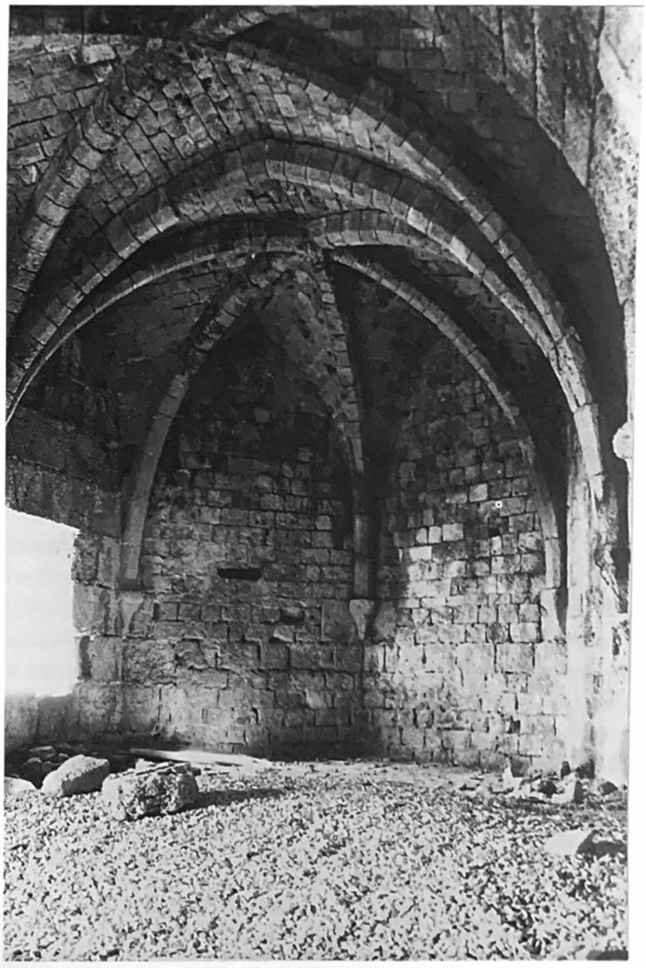
in the mid-thirteenth century. Johns dates this chapel along with the great hall in the inner north tower to "about 1250."[268] Camille Enlart compares the column bases for the chapel portals to work from the transepts of Notre Dame in Paris, and Baron Rey reported that fragments of the chapel windows reminded him of the Sainte Chapelle.[269] The ribs of the west undercroft probably resemble those that would have been seen in this chapel (Fig. 69). It seems likely, as Barber suggests, that the remarkable polygonal form of both this chapel and the octagonal chapel at Safed were built as a response to the loss of the Templar headquarters in Jerusalem.[270]

On the basis of this evidence, the polygonal chapel, whose foundations we see today, was probably built to replace an earlier more conventional, most likely rectangular chapel on the same site from *c.*1218. Oliver of Paderborn refers to the "*oratorium*" along with other buildings in the castle that he says were built for "utilitas,"[271] and we can expect that he might have commented on such a remarkable polygonal design for this chapel if it had been designed this way at that time. Indeed it seems fair to conclude more broadly that most of the extant decorative architectural sculpture – figural and nonfigural – inside the castle and in the town must belong to a phase of construction later in the thirteenth century. To this period belongs the third storey of the north tower where, on the east wall, we see human-headed corbel decorations, and the handsome church built inside the town walls[272] (Fig. 66). This work appears to belong to the time that certain of the latest buildings in the town at ʿAtlit were also going up. This period extends from just before the arrival of Louis IX in the Latin Kingdom, that is, in the 1230s and 1240s, to the time that Louis IX was active while in residence in the Holy Land, 1250–4, but well before the incursions of Baybars in the 1260s.

Among the finds at ʿAtlit, besides the architectural material, there is also a Crusader cemetery located outside the walls of the Crusader town, along the road from the northern gate to Le Destroit.[273] The number of graves in the cemetery has been estimated to be 1,700, but the number of persons buried there may far exceed this number because of the existence of mass graves. It seems reasonable to imagine that burials began here from the time of the building of the castle and continued up to 1291, but so far no attempt has been made to date any individual tomb.



69. ʿAtlit, Chastel Pelerin, view of the west undercroft.

Many of the burials are marked with stone tomb slabs, some of which have carved designs. None of the extant slabs in this cemetery has figural designs, but some have Latin cross designs (Fig. 68).[274] Enlart remarks that this kind of horizontal grave slab was the most common during the Middle Ages, East and West, by which he means for Frankish burials.[275] It is not clear which of these carved slabs belong to members of the Templar order and which belong to those persons who lived in the castle or the town but were not Templars. Johns notes that "many of the graves are probably those of the townspeople, the pilgrims and the local employees of the knights. Yet it seems likely that the knights themselves, their chaplains, serving brothers, and Syrian men-at-arms were buried here as well, and that it is mainly their graves, or those of visitors of standing, lay or ecclesiastical, which are marked by the carved tombstones."[276] The Templars had rights to their own burial grounds, and this may very well have been one of them. It is in any case the only large Crusader cemetery that has been identified intact in the Latin Kingdom from the thirteenth century. Whether there were also any burials inside the castle or inside the chapel in the castle has not been determined.[277]

Pottery at 'Atlit (Fig. 70) Besides 'Atlit's importance as a new and important castle, a new town, and for its remarkable cemetery, it is also of interest as an archaeological site because of the glazed pottery excavated in the town.[278] In fact 'Atlit is one of only very few major Crusader castles in the Latin Kingdom that have been excavated archaeologically to some extent, as opposed to being just cleared.[279] The pottery excavated there, which has a terminus post quem of 1217–18, is therefore significant in relation to the other sites investigated in the Crusader States.[280] The decorated pottery found at 'Atlit is mainly one of three types: St. Symeon ware from the region of Antioch,[281] proto-maiolica from southern Italy,[282] and by about 1220/5, Cypriot graffita ware.[283] Byzantine Zeuxippus ware from Constantinople and the Aegean[284] in the late twelfth and early thirteenth century is not found at 'Atlit apparently because this site only began to function in 1217/18 when Zeuxippus ware was largely being replaced by the Cypriot graffita ware. This pottery raises questions of trade and commerce on the one hand and the nature of Crusader artistic activity on the other. What are the characteristics of these various types, and which was Crusader?

'Atlit is of special interest because the pottery found there basically reflects current use during the thirteenth century, from 1217–18 to 1291. Of the major types of glazed pottery found here, some of it sgraffito ware,[285] only one is made in the Crusader States, namely the "St. Symeon ware" from Antioch.[286] This pottery is a polychromed, lead-glazed, sgraffito ware and was made in St. Symeon from the early years of the thirteenth century until 1268, when the principality of Antioch fell to the Mamluks. The most typical shape for this pottery is a shallow bowl with a flat lip.[287] Lane describes the pottery as follows:

> The clay body of the 'Port St. Symeon' ware is light orange- or pinkish red, rather coarse, and hard;. . . . The visible surfaces were covered with a thin white slip, through which the design was engraved in strong, thick lines when the clay was leather-hard. The colouring pigments were then applied in the necessary places, the normal scheme being an alternation of green (from copper oxide) and yellow brown (iron-oxide) with occasional additions of purple (manganese). The whole decorated surface was then covered with a transparent lead glaze which fired to a slightly yellowish tone and absorbed the colours. Very rarely the glaze is stained a monochrome green.[288]

The typical decorative repertory of motifs appears to include ornament in concentric bands, with cable, leaf-ribbon, and simple geometric forms along with triangular shields and pseudo-Kufic inscriptions. The well of the bowl can receive a radiating pattern, or a central object such as a shield or sun-face. Some interesting bowls also have figures of birds, animals, monsters, and even humans.[289] Among the examples of human figures depicted are an interesting man in Eastern dress holding a drinking vessel[290] and a soldier holding a large sword.[291]

The other graffita ware found at 'Atlit is from nearby Cyprus, a new source that replaces the older Byzantine Zeuxippus ware and its less fine Aegean relatives in the Crusader States in the 1220s. Cyprus sgraffito pottery

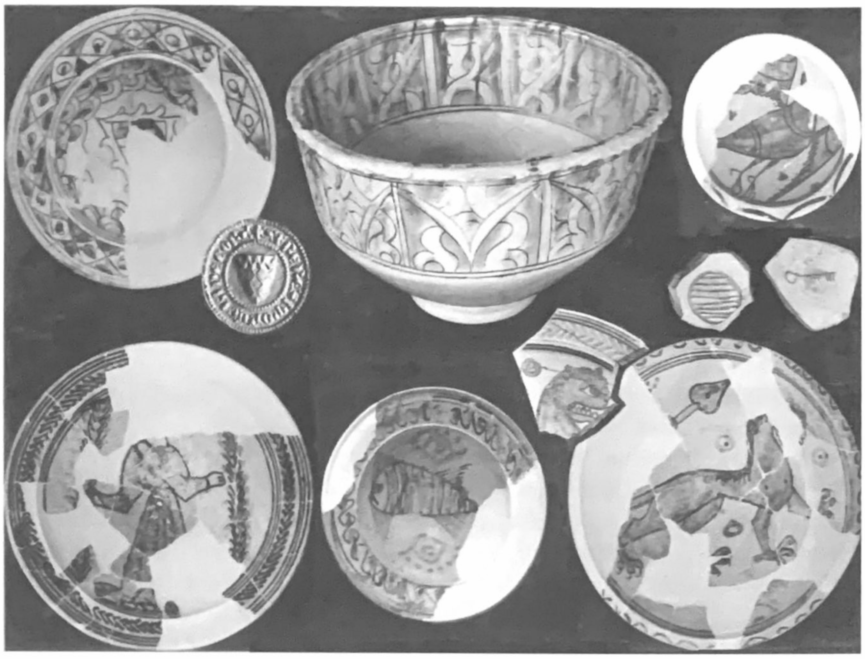
> types include those with a colorless or slightly yellow glaze (Cypriot Ic), others with a green glaze (Cypriot X), and a third (Cypriot III) with a clear glaze enlivened with splashes of brown and green. One of the commonest forms taken by the monochrome types is that of a carinated bowl with a vertical outwardly-concave rim and a high foot-ring base. The incised decoration of these bowls consists of concentric circles in the base and around the rim and of motifs described as "blazons", including representations of keys, fish, towers, hatched roundels or triangles.[292]

Lane noted that in appearance, the clay of the Cypriot bowls was similar to St. Symeon ware, but that the glaze is thicker, with a glossy and often irridescent surface. Furthermore, he says that "the engraved decoration is done with a finer point and the crowded patterns lack the bold simplicity found at Port St. Symeon."[293]

One of the interesting aspects of the Cypriot pottery, like that of the St. Symeon ware, is the fact that its repertory of decoration includes numerous human figures. Some wear Byzantine or European dress, including knights holding a sword and a shield, ladies with plaited hair wearing long dresses, and wedded couples embracing.[294] Although the dating of Cypriot pottery with these figures to the early period, that is, the 1220s, is not certain, and indeed there is some disagreement on dating, the interest in diverse imagery, which reflects to some extent the patrons for whom these vessels were being made, and the fact that these figures depict both Frankish and Byzantine dress are notable.

The third major type of pottery excavated at 'Atlit, ware known as proto-maiolica, was found in large quantities. Proto-maiolica is a polychrome tin-glazed pottery produced in southern Italy and in Sicily from the late twelfth century to *c.*1400. Pringle characterizes it by saying that

> this ware is distinguished from the other types found at 'Atlit by its painted decoration, executed in dark brown-black, blue and yellow-brown, over an opaque white tin glaze. The fabric usually tends to be rather coarse and sandy, cream or buff in colour and sometimes pinkish in fracture. Forms at 'Atlit



70. 'Atlit, pottery: Proto-maiolica ware, and seal of Simon de Guinecort, excavated at 'Atlit. (photo courtesy of the Palestine Exploration Fund, London)

> include plates and bowls with low foot-ring bases and with rims either plain, flanged or thickened and hollowed.[295]

The repertory of decoration in the wells of these bowls is similar to what is found on the St. Symeon ware and the Cypriot sgraffito ware, albeit done by different designers. We find fish, birds, flora, animals, human figures, heraldic designs, abstract patterns, and even city walls with pennants flying.[296]

These three important wares found at 'Atlit have been selected here for notice in order to propose certain points about Crusader pottery *c.*1220. It should be clear that these are not the only wares found at 'Atlit,[297] or other Crusader sites, such as at Acre.[298] Besides these, there are, for example, much smaller amounts of underglazed painted pottery from Muslim Syria, among other types of interest. However, these three are the most important decorated glazed wares. Of these three types, one is "Crusader," that is, produced in a Crusader center, and that center is at St. Symeon in the principality of Antioch. This affirms in a new way the artistic presence and importance of Antioch as a producer of Crusader art. The other pottery was imported from outside the Crusader States, from Cyprus and from south Italy/Sicily. What is interesting about these imports is that they are large in quantity, and their decorative repertory is comparable, at least in terms of the human-figural designs, to the St. Symeon ware. However, they offer significant variations in technique, shapes, and colors, and an expanded repertory of decorative motifs for Crusader buyers and patrons.

'Atlit as a new consumer and trading center, close to Acre and to Caesarea, immediately becomes a part of the Crusader commerce in pottery after its completion in 1217/18, and the growth of the little town adjacent with its newly constructed walls in the 1220s. Certainly military shipments of grain, horses, and arms, accompanied by pottery, by and for the Templars from southern Italy to 'Atlit could partly explain the large amounts of proto-maiolica found there.[299] However, as Pringle has pointed out, one feature of the finds at 'Atlit is that they parallel finds at other major Crusader coastal sites:

> This hints at the existence in that period of a fairly intensive system of coastal redistribution, fed in part from potteries within the Crusader states producing both fine and coarse wares and in part with imports from southern Italy, Byzantine Greece [and Cyprus] and Muslim Syria. The abundant documentary evidence for long-distance trade between Europe and the Latin East in the later twelfth and thirteenth centuries has perhaps tended to obscure the role played by coastal shipping in the economic life of the eastern Mediterranean before and during the time of Crusader settlement in Syria and Palestine. The evidence from pottery, an item of trade which is barely mentioned in written sources in any case, thus helps provide a useful corrective to the picture of trading activity presented by the surviving documentary evidence.[300]

Heretofore we have not attempted to discuss the issue of pottery and trade in the Crusader States at any length, partly because of the difficulty of dating the archaeological finds and partly because the study of Crusader ceramics is still very much in its beginning stages. With 'Atlit, however, we have a firm terminus post quem as we have indicated, and we can begin to glimpse the role that decorated glazed ware played in Crusader life, both economically and artistically. From this period, we can refer to the pottery at the various Crusader sites on a regular basis, and attempt to discern changes and developments through the thirteenth century. Like the coinage, with its tondo-based designs albeit without the numerous and specific possibilities of dated examples, pottery provides us with an important continuous view of economic life and an artistic dimension of popular culture in the Crusader States that we will attempt to assess from this point to 1291.

'Atlit and the Relics of St. Euphemia There is one final aspect, a matter of religious significance, connected with 'Atlit at this time which sheds light on its importance as a new center for the Templars, and for the Crusaders and other pilgrims on the coast between Mount Carmel and Caesarea. Various pilgrims' reports and handbooks written from about 1231 on mention that at "Chastiau Pelerin ... est de la maison du Temple, & gist iluec sainte eufemie, virge & martire."[301] Saint Euphemia, virgin and martyr (+303), was in effect the patroness of the Council of Chalcedon held in 451,[302] and certain of her relics were identified in Constantinople by several Crusaders at the time of the Fourth Crusade. Both Martin of Pairis and Conrad of Halberstadt came away from Constantinople with relics of St. Euphemia, which they took to the West. It is unclear whether the relics of St. Euphemia mentioned in 'Atlit all through the thirteenth century came from Constantinople.[303] It seems that the origin of the remains of Euphemia at 'Atlit were thought to be part of a miraculous translation, either from a local or from a somewhat more distant Levantine source.[304] Only the thirteenth-century pilgrim Philipp says they had been miraculously brought to 'Atlit from Constantinople.[305] It is also unclear whether the Templars at 'Atlit claimed to possess the whole body of St. Euphemia or only the head. Certainly by the time of the dissolution of the Order, the head, said to have been kept in a silver reliquary, was the most important relic.[306]

M. Barber describes one version of the situation:

> At 'Atlit, among other relics, they kept the heart and body of the virgin and martyr St Euphemia of Chalcedon (d. 303), whose miraculous properties drew in many pilgrims travelling south along the coast road from Acre on their way to Jerusalem. According to tradition, these remains had been miraculously translated to 'Atlit, a belief which must have added to their potency in the eyes of the faithful, although in fact the dedication of a church to the saint near Caesarea as long ago as the seventh century suggests that the region had been associated with her for many centuries before the time of the crusaders.[307]

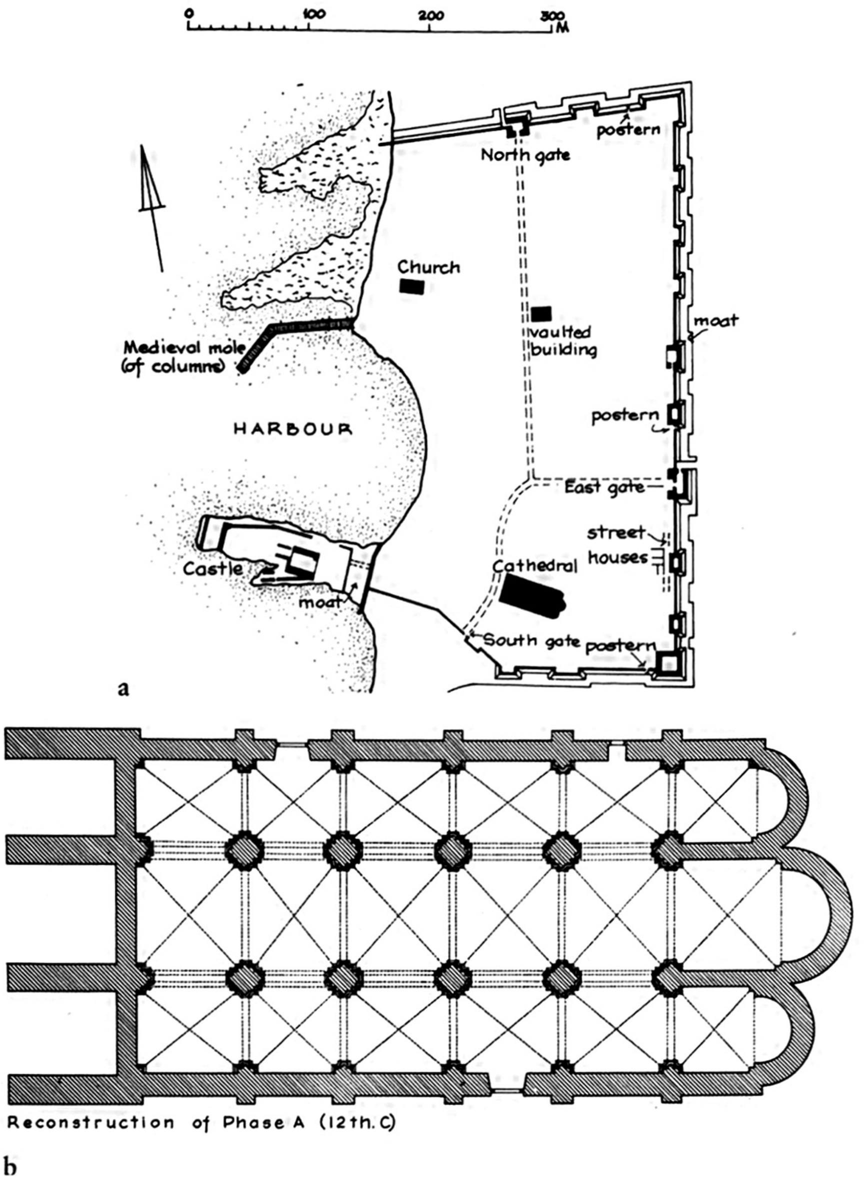
The question is, of course, where were these relics kept and what kind of reliquary they were kept in. Despite the lack of evidence from the excavations carried out on the two relevant churches, the most likely location was in the castle chapel, because the town church was not built until later on, probably in the mid-thirteenth century. It is interesting therefore that one of the functions of the castle chapel was as a pilgrimage church, which preserved holy relics. We shall be interested to consider this aspect of its role in considering its new design at the time it was rebuilt in the mid-thirteenth century. Unfortunately we know nothing about the container in which the relics were kept. It is possible, however, that the reliquary was a new product of Crusader goldsmiths commissioned by the Templars, perhaps in nearby Acre. Once again we can only glimpse the possibility of a thriving metalwork industry in these years.

The phenomenon of having the relics of St. Euphemia in 'Atlit is an important development for the Latin Kingdom. It demonstrates the possibility that certain new centers for relics came into being in the thirteenth century when access to the major holy sites was difficult, that these new places became well known by pilgrims, and that the sources of their relics could be more or less local, that is, not brought from Constantinople or from the West. This means that despite the flood of relics to western Europe in the wake of the Fourth Crusade,[308] local relics in the Holy Land were able to establish themselves for the pilgrims who kept coming to the Latin Kingdom. Because of the inability of the Crusaders to retake the main holy sites, the difficulties of the Crusader circumstances vis-à-vis the Muslims stimulated the identification of holy relics and holy places inside the territory controlled by the Latin king, the count of Tripoli, and the prince of Antioch. Furthermore, it means that a major fortification, like a castle, could become a holy place of sorts, something of a new development for the Crusaders in the thirteenth century, and a somewhat unexpected function for a castle.

K. Molin has discussed the various nonmilitary functions of Crusader fortifications in a recent article and his new book.[309] He suggests that the Templars at 'Atlit had an ideal site for levying tolls from tradesmen along the coastal road at Le Destoit, and they may well have done so the same way that the Hospitallers did it at Margat, also known as Marqab. At Margat, "a wall had been constructed running [down the hill] from the fortress to the water's edge, so that people using the coastal road between the County of Tripoli and the Principality of Antioch were obliged to pass through a small gate and pay a fee before they could continue on their journey. This operation was supervised from a tower near the gate, the occupants of which therefore carried out the dual task of protecting travelers against robbers, and at the same time raising revenues for the Hospitallers."[310] For pilgrims also, Molin says, "Pilgrims' Castle itself probably became a popular spot for visitors to spend the night, so that its garrison could continue the traditional Templar occupation of looking after Christians traveling between Jerusalem and the coast."[311] In this role, 'Atlit became a safe haven for not only pilgrims, tradesmen, and other travelers, but also for the relics of St. Euphemia. In sum, Pilgrims' Castle became a major center for the Templars along with their fortified headquarters in Acre, it was a new and very important Crusader defensive position along the coast, and it was given a certain religious significance by the presence of the relics of St. Euphemia there from an early moment – after 1218 but well before about 1231, when the first pilgrim's text mentions the relics there.

Dismantled and Rebuilt Crusader Cities and Their Churches

Chastel Pelerin is clearly the most important entirely new Crusader military construction in this period, along with the new walls of Montmusard at Acre. There were, however, numerous fortifications whose walls were taken down and rebuilt during the years 1210–25. Caesarea Maritima, located just south of 'Atlit, is the central example in this period. Saladin had dismantled the walls of Caesarea at the time of the Third Crusade, and the city was recovered and reoccupied by the Crusaders by the terms of the ensuing truce. It was not, however, refortified and repopulated until 1217, when King John of Brienne, with the assistance of Leopold of Austria and the Hospitallers, began to rebuild it in December 1217. On 2 February 1218, the patriarch of Jerusalem and six bishops were able to celebrate mass in the Church of St. Peter inside the newly refortified city. Unfortunately this work was quickly undone, however, by al-Mu'azzam, who during his campaign against the Latin Kingdom in the winter of 1219–20, attacked the city and dismantled the walls again.[312] They were not rebuilt until the late 1220s, May of 1228 to be exact.[313]



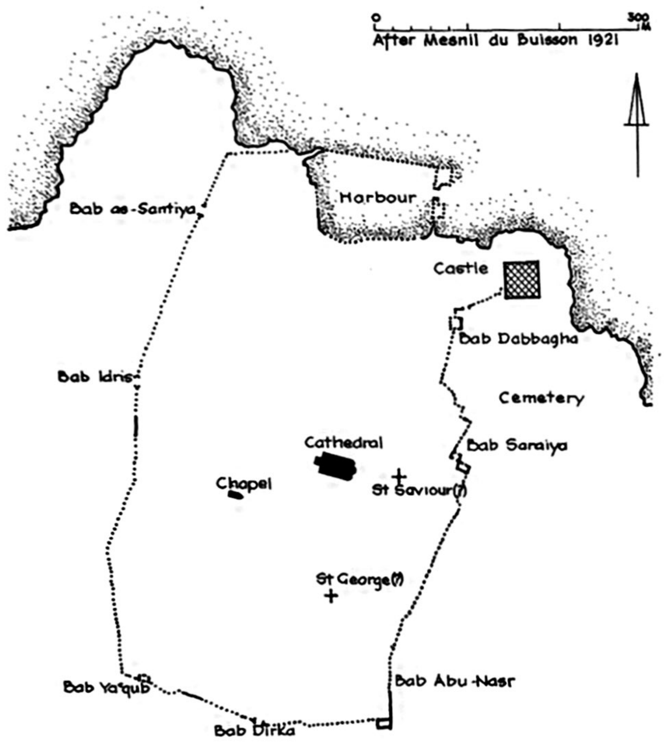
71. Caesarea, a. Plan of the city, and b. Plan of St. Peter's Cathedral. (photo: after Pringle, *Churches*)

Caesarea's cathedral has been excavated adequately to discern that it had three building phases to it (Fig. 71).[314]

The first phase constituted the twelfth-century church, which was a three-aisled basilica with five bays. It is architecturally comparable to the church at Gaza,[315] as well as the cathedrals of Beirut[316] and Tortosa.[317] The two later phases appear to be rebuilds of the east end of the church for which there is no documentation as to their dates. We propose that perhaps the east end of the church was damaged at the time of Saladin's destruction of the city in 1191, and it was rebuilt in a makeshift way in order for the church to be used as the city began to be repopulated during the truce. When the city walls were rebuilt in 1217–18, however, the east end of the church was possibly repaired properly and the apsidal configuration was rebuilt almost to the same previous design. This work was done in time for the patriarch to celebrate mass here on the Feast of the Purification, 2 February 1218. As evidence for this scenario, I refer, first, to the findings that there is nothing to show that major changes in the new gothic style of the later thirteenth century were attempted here, and second, to the need for the cathedral church to be useable and functioning at all times when the Crusader population was present in the city.[318]

Other cities that had been demolished by Saladin during the time of the Third Crusade were not so fortunate. Ascalon had had its walls dismantled a second time under the terms of the treaty of 1192 and, as Pringle points out, the site lay derelict until November 1239.[319] Jaffa had, of course, been ceded to the Crusaders in 1204, and although some Christians were in residence thereafter, when Thietmar visited in 1217 the place was empty and its defenses were not rebuilt until troops of Frederick II arrived in 1228.[320] Sidon was regained by the Crusaders in 1197, but its refortification was not undertaken until 1227.[321] Finally, as we have seen, the walls of Jerusalem were dismantled by al-Mu'azzam in 1219, so that if Jerusalem were ever to fall into the hands of the Crusaders again, it could not be used as a fortified city against the Muslims.[322]

In addition to these various city fortifications and their churches there were also a number of castles whose walls were destroyed in this period, especially at the hands of al-Mu'azzam in his campaign against the Latin Kingdom during the fall and



72. Beirut, Plan of the location of John of Ibelin's Palace. (photo: after Pringle, *Churches*)

winter of 1219–20. Belvoir had been lost to the Muslims in 1187, but apparently it was garrisoned by them until 1219. At that point al-Mu'azzam had its walls taken down, and it did not return into Crusader hands until 1241.[323] The walls of the castles on Mount Tabor – built by the Muslims themselves – Safed and Toron, were also taken down at this time.[324] Al-Mu'azzam's main line of fortified defense was anchored across the Jordan at Shaubak (Montréal) and Kerak, the latter which was refortified in 1192–3, and both of which he and his successors held onto firmly from 1218 onward.[325] Al-Mu'azzam insisted on the importance of these two fortresses for protecting his lines of communication with Egypt despite Crusader attempts to negotiate their return during the Fifth Crusade.

Otherwise, among the most remarkable architectural works we know about in this period there is the palace of John of Ibelin at Beirut (Fig. 72). The palace and fortifications at Beirut had been lost to Saladin in 1187 and retaken by the Crusaders in 1197.[326] The palace is famous mainly because of the detailed description given by Wilbrand of Oldenburg in his pilgrim's account (1212) referred to earlier:

> The fortress is very strong. On the side where it is highest, it is defended by the sea and by the escarpment of high rocks. On the other sides, it is surrounded by a masonry ditch, so deep that one can place prisoners there as if they were in a secure jail. The ditch is dominated by two strong walls in which are erected powerful towers, tested by the blows of siege engines. Their stone blocks, which are of large size, are linked to each other by iron joins set in durable mortar. In one of these towers recently constructed, we saw a very lovely palace which I will describe briefly, although I do not feel competent to do it. The palace rests on solid foundations. It is well situated, looking out on one side to the sea and the ships which pass by, and on the other, to view the meadows, the shepherds, and very pleasant countryside. It has a fine (subtile) marble pavement, which reproduces ripples on the water blown by a light breeze, in such a way that when one walks across it, it is as if one fords the water without leaving a trace on the sand represented below. The walls of the house are entirely covered with revetments of marble plaques done in the finest work, which resemble multi-colored wall hangings. The ceiling is painted the color of the sky, with such facility that one seems to see clouds pass, elsewhere a wind blowing, while the sun marks by its passage the course of the year, the months, the days, the weeks, the hours and the moments of its movement in the zodiac. Syrians, Muslims and Greeks boast of their virtuosity in this art and compete with each other in producing such delightful work. In the middle of the palace is found a nymphaeum[327] decorated with mosaics of diverse colors, in which the tesserae of different hues are so well assembled that one feels they could not be more finely done. These mosaics display an infinite variety of flowers in blossom which trick the eye into trying to identify them. In the center is a dragon, which seems to wish to devour the animals painted with it, and who gives birth to a crystalline fountain with water in such abundance that spouting upward, humidifies and refreshes, when it is hot, the air that penetrates the windows distributed in fair order on all sides. And this water, escaping the nymphaeum by passing through many tiny orifices, generates a soft murmur which invites sleep to those sitting nearby. I would very much like to pass my life in such a way there.[328]

Wilbrand's description is quite remarkable for the refinement and elegance it conveys, for the information it gives about the residence of a very important Crusader noble in the Latin Kingdom, for the attitude toward nature that it reveals on his part and on the part of John of Ibelin's artists, and for the information it gives us not only about those artists, but also about their work for a Crusader patron. The details provided are unusual and reflect an increased concern to record the *realia* of the visual and aural world. Despite the presence of this palace in a strongly fortified tower, the special comforts and delights that it provided the prince are far removed from the concerns of Crusader military architecture.

Not only is Wilbrand's description unusually detailed, but also his poetic sensitivity toward nature is unmatched among pilgrims' accounts in terms of the mood he evokes in this airy, sunny courtyard, looking out over sea and meadow, with water splashing from the fountain. The idea of combining an imaginary dragon for the fountain with diverse animals in the midst of arrays of colorful flowers portrayed in richly hued mosaics reminds us of late Roman and early Christian work from Antioch. It is a tradition followed in the superlative mosaics of the Ommayad villa at Khirbet al-Mafjar near Jericho, not to mention the courtyard of the Great Mosque in Damascus and the impressive mosaics of the Dome of the Rock/Templum Domini in Jerusalem.

John of Ibelin apparently employed local artists, Syrian and Greek Orthodox, and Muslims, to execute the marble floors and revetments, the paintings on the ceilings, the mosaics, and the waterworks for his palace.[329]

One need only look at the exquisite work surviving in monuments such as those mentioned earlier in conjunction with this description to imagine what this palace must have looked like. It is important to realize that John sought to employ the finest artists here working together for him in a secular, residential setting, in the way that the Latin king, Byzantine emperor, and bishop of Bethlehem had jointly sponsored the finest artists – Greek and Syrian Orthodox, and Latins, including Venetians – to decorate the Church of the Nativity in Bethlehem in the 1160s. This multicultural assembly of skilled artists in Beirut is impressive for two reasons, even if the results of their work is no longer extant. First, we see that the coming together of East and West that we found in the art of the Crusaders in the twelfth century is evident here as well, along with a heightened sensitivity toward the representation of nature. Second, we find that this art is produced for secular, not ecclesiastical use, as a reflection of the comfortable, indeed elegant lifestyle of certain of the established nobility in the Latin Kingdom, even in difficult times.

It is unfortunate that nothing much of this aristocratic world or its ecclesiastical counterpart survived the fall of the Crusader Kingdom in 1291. The result is that we only have glimpses of them, such as the example afforded by this passage, and occasional artifacts. Such an artifact is a particularly beautiful carved wooden panel, executed in the thirteenth century in Syria, which is preserved today in the Musée des Arts Decoratifs in Paris.[330] The panel in question is rectangular in shape, measures 1.78 × 0.92 meters, and features an exquisite and geometrically intricate star motif with interlocked diamonds carved in relief over its surface (Fig. 73). The sophisticated geometric design is enlivened with delicate floral decoration in the interstices, the work of an Arab or Turkish master carver, who was, however, apparently working for a Christian patron. In the border that frames the geometric and floral designs, we find a Latin inscription in Gothic script, as follows:

> Ego sum panis vivus qui / de celo descendi si quis manduca[v]
> erit ex hoc pane vivet in / eternu[m] qui manducat in / [m]eam
> carnem et bibit meum sanguinem [in] me manet et ego [in illo].
> (John 6: 51 and 57)

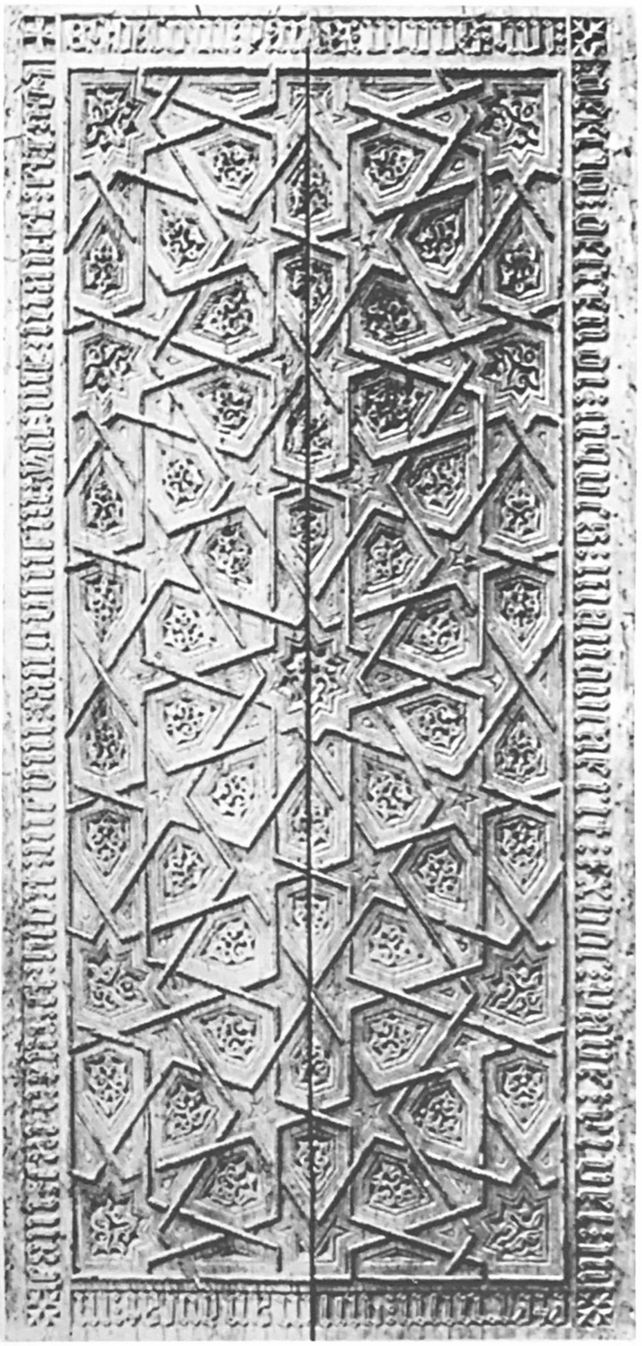
The religious content of this inscription suggests this panel was to be used in conjunction with the Eucharist, either as the panel for a special closure or as a window or a portal to a chapel, chamber, or church.

Similar wooden carved panels with intricately decorated cross designs were done for the west portals at Bethlehem at the Church of the Nativity.[331] These panels received Armenian and Arabic inscriptions, and are dated 1227.[332] There they were apparently used for the entry doors to the main nave. We have no information in regard to the location where our panel was done or for what specific site, nor do we know exactly when it was done, although the style of the script clearly indicates that it was executed in the thirteenth century. What is clear, however, is that this handsome sculptural work combines the Islamic geometric and floral decorative tradition with a Christian Biblical text for use in a Latin church or chapel, presumably somewhere in the Crusader States. As a work of art for the luxury market, it forms part of a corpus of works, most of which are metalwork and enameled glass, done by local Near Eastern artists, some local Christians, some no doubt Muslim, who produce works for Crusader, Frankish, and other patrons. Most of our examples appear to belong to the latter part of the thirteenth century, and will be discussed later, in Chapters 6 and 7.

Crusader Churches in Egypt

When the Fifth Crusade captured Damietta in November 1219 and held the city until September 1221, the main mosque of the city was turned into a Latin church. It was consecrated by the papal legate, Pelagius, as the Cathedral of St. Mary on the Feast of the Purification, on 2 February 1220. Oliver of Paderborn described the church:

> It is seen to be laid out on a square plan, almost as wide as it is long, and carried on 141 (or 139) marble columns, forming seven galleries (or colonnades: *portici*). In the centre is a long



73. Paris, Musée des Arts Decoratifs, Carved Wooden Door Panels with Latin Inscriptions, c. 1215 (?). (photo: after *L'Islam dans les Collections Nationales* catalogue)

> wide open space, in which a pyramid rises up in the manner of a *ciborium.* Against the outside of the western wall a spiral [stair] rises on high like a bell-tower. Four principal altars were set up in it: the first dedicated to St. Mary, the second to Peter, Prince of Apostles, the third to the Holy Cross, and the fourth to St. Bartholomew, on whose feast day the river tower was captured.[333]

The plan apparently was to name a Latin archbishop to the see in Damietta, but no one was nominated before the city was lost in 1221.

Nothing remains of the great mosque today, nor is the whereabouts of other Crusader churches in Damietta, for example, the Church of St. Bartholus, known. Other traces of the Crusader presence in Damietta appear to have been obliterated.[334]

CRUSADER PAINTING

Just as we discovered in the previous period up to 1210, the architectural work of castle and church building generated a variety of painting activity between 1210 and 1225. Indeed some of this activity is quite unexpected, such as the secular monumental painting in the Palace of John of Ibelin in Beirut, in the form of ceiling frescoes, mosaics for the fountain, and intricate marble inlays for the floors and the revetments on the walls. There is also the evidence of the manufacture of "Crusader" ceramics at al-Mina, that is, St. Symeon near Antioch, and possibly at other Crusader sites, and the importation of this and other pottery at 'Atlit. What is equally clear from the finds at 'Atlit is that they are representative and typical of most major Crusader coastal sites at this time, each of which seems to have produced its own pottery.[335] They demonstrate that there was a lively trade apparently well established. Furthermore this shipping commerce brought several different types of pottery to these Crusader sites from the West, from Byzantium and/or Cyprus, and from other sources in the Crusader States, including especially St. Symeon.

The above-ground investigation of the castles at Crac des Chevaliers and Margat in the period before 1210 revealed an extensive program of fresco painting was planned for both, mainly focused on the castle chapels. We are justified in extrapolating from these finds that at 'Atlit the castle chapel may also have been embellished with such painting. Of course, at 'Atlit not only are there no extant paintings of this sort, but also the original chapel has apparently disappeared, having been replaced by a later and quite sophisticated chapel in the mid-thirteenth century. Despite the lack of any evidence about the earlier chapel or its decoration, we know a great deal more about 'Atlit than we do about Crac or Margat because it has received a certain amount of serious archaeological investigation. We may be sure that if and when similar campaigns of archaeological study are carried out at both Crac and Margat, it will be possible to assess the extent to which they participated in the same commerce in pottery, not to mention aspects of other possible artistic activities carried on in each place.

In regard to manuscript illumination, unlike the previous period before 1210, we can only unfortunately report that we have no certain extant examples from this period, 1210–25.[336] Nonetheless we can suggest that this is the result of chance survival, not an indication that there was nothing done at this time in the Crusader East. We know, for example, that Crusaders at Damietta carried books with them and read them for enjoyment during the long encampment during the siege in 1218–19. Philippe de Novare tells a story about how Pierre Chappe and Raoule de Tiberiade pressed him to read to them from a *roman.*[337] Although there is no evidence that these books are illustrated, and if illustrated, where – in Acre, in Cyprus, or somewhere else – nonetheless, it is important to note that Crusaders carried *romanz* texts, that is, books with works written in verse or in prose, in Old French, with them. It is one indication of the relation between the aristocratic knights and this kind of "literature chevaleresque," which as Jacoby writes, "contribua affermir la conscience d'un groupe social qui, en dépit de sa disposition géographique de l'Occident au Levant, ne connaissait pas de frontiers et se considérait comme un communauté partageant les memes attitudes et la meme éthique."[338]

There are also the lists of books that do survive, such as the Nazareth list now in Erfurt, dating *c.*1200, and the references to books contained in the Antioch inventory, dated 1209, that we have discussed in Chapter 3. There is the Naples Missal that we discussed also in Chapter 3 and dated to *c.*1200. Surely it is not impossible to consider that if the Naples Missal was executed to resupply an unknown church in Acre with a service book needed because of the destruction and losses to churches in Acre or elsewhere, for a congregation located there, we are justified in projecting similar needs into our period. At 'Atlit, a wholly new castle chapel would have needed its own service books, which may well have been ordered in nearby Acre from the Templar headquarters there. At Caesarea, the damage to the Cathedral Church of St. Peter may have required certain replacements among the required service and prayer books, in order to celebrate the return to the church on 2 February 1218. Since we know that the patriarch of Jerusalem celebrated that special liturgy together with six bishops, it is not impossible that he individually, or they corporately, made a gift of a new service book (or books) to Peter of Limoges, the current archbishop of Caesarea. The list of such possibilities could be lengthened, but our purpose here is only to suggest that the fact that we cannot at present identify actual books produced in the Crusader States between 1210 and 1225 should not be taken as an absolute indication that no such books were produced, or that such books might not be recognized in the future.[339]

The same argument must also be made in regard to panel painting, but for this medium there are several possible extant candidates that may have been painted between 1210 and 1225. As we have seen in the period before 1210, there is good reason to think that icons were beginning to be commissioned and used by the Crusaders, based on the evidence of the Freiburg Leaf and the panel of the enthroned Christ from St. Catherine's Monastery, Mount Sinai (Fig. 52, App. no. 76/1024).[340] In the context of that same discussion, we proposed to see the tiny icon of the *Maestas Domini* from St. Catherine's (Fig. 51, App. no. 34/308) to be dated approximately *c.*1220 to *c.*1230, largely on the basis of its parallelism stylistically with the earliest examples of Gothic painting in the West.[341] Kurt Weitzmann, of course, dated this panel somewhat later, to the second half of the thirteenth century, but he noticed that the interlaced cable pattern on the frame, like that on the enthroned Christ icon Nelson and Hunt now date to the mid-thirteenth century, suggests an earlier date. He even suggested that on this panel, the "lower layer . . . also depicted a Christ enthroned, or perhaps a *Maiestas Domini*."[342] One cannot, however, see a lower layer here, and I would like to propose that perhaps we are looking at the "lower layer," which may have been touched up, as icons often are, later in the century.

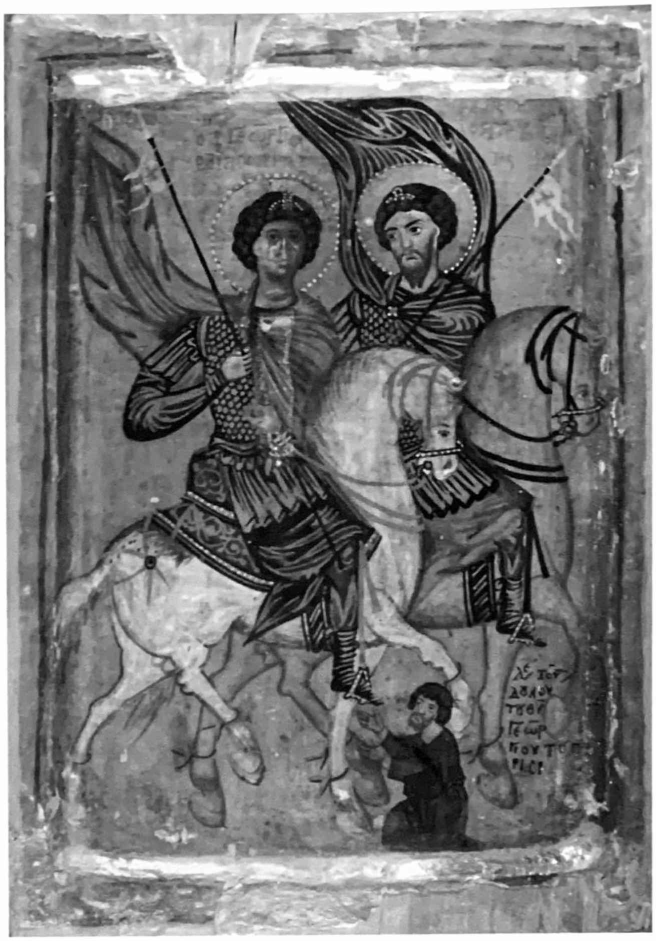
I suggest that this representation of the *Maiestas Domini* is in fact based on images widely seen in France in the early years of the century. Not only is our icon completely western in its basic theme and iconography, and in the Latin inscriptions that the apocalyptic creatures hold, but also it is one of the earliest examples of this Western presence among the collection of icons at Sinai. Compare this *Maestas Domini* icon with early thirteenth-century French miniatures of the same subject, such as the missal of St. Maur-les-Fossés done in Paris and dating about 1200.[343] The image in the missal is quite simple, not very well painted, and bears only a general resemblance to our panel. However, the miniature is an early version of what blossoms into the *Bible Moralisée* style in the 1220s with features more recognizeably closer to the icon. Consider, for example, the carpentered throne (as seen on the image of the throne of Solomon), the pink and blue colorism, and the repertory of ornament (as seen in the contiguous circles of the borders), and to a lesser extent, the linear drapery style of Christ's cloak.[344]

The Sinai *Maestas Domini* icon is clearly a difficult example with which to deal. It is difficult because it is in such damaged condition and careful study is needed to see to what extent the main figures may have in fact been repainted. It is problematic in terms of its specific iconography with the poses of the main figures, what they are doing and what they carry. Its style is hard to assess because it seems to be so composite, and the parts are mostly Western, making the combination rather curious. Nonetheless, its special characteristics may well be original to the 1220s at St. Catherine's on Mount Sinai.

A similarly difficult icon to assess is the panel that Kurt Weitzmann compares most closely to the lower scene on the Freiburg Leaf, namely the image of St. Theodore Stratelates and St. George Diasorites with the donor/pilgrim named George Parisi (Fig. 74, App. no. 94/1463).[345] Weitzmann does not date the Theodore and George icon as early as the Freiburg Leaf, but he proposes that the artist of the Freiburg Leaf may have seen an earlier panel like this one. What he suggests exactly is the following: "Some features point to a Crusader icon, comparable to the one with St. Theodore and St. George on Sinai, although the latter is somewhat later in date, so that the artist of the model book must have copied an earlier icon of this type."[346]

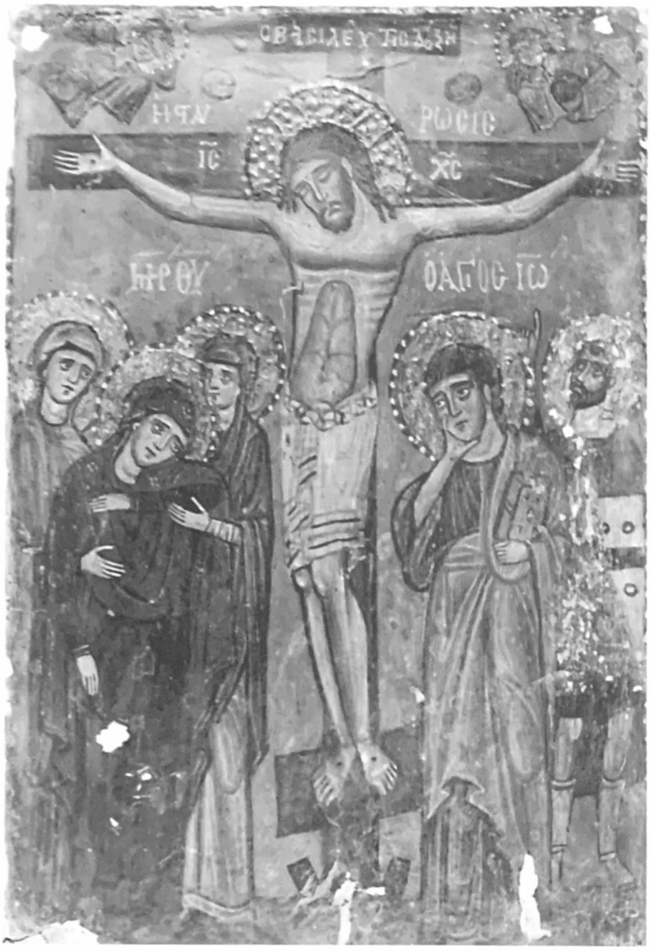
As a specific indication of what he meant by "somewhat later in date" for this icon, Weitzmann suggested the years 1250–1300 on the reproduction that appeared in one publication.[347] However, it would not be impossible according to any of his published remarks or discussion to date this icon of Sts. Theodore and George before 1250, to the first half of the thirteenth century, and I would propose to place it as early as *c.*1225, or in the period 1225–50. The question is also, where might it have been done?

The artist of this icon does not necessarily seem to be French in background; that is, this work does not obviously parallel works in the recognizeably Franco-Byzantine Crusader style of icons now at Sinai. There are, however, certainly details of the soldiers' garments, their banners, and the horses' decoration that reflect French style. Yet there is no question that these knights look notably Byzantine. They wear Byzantine military costume; their facial types are Byzantine; and the flame-like drapery of their cloaks is dramatically delineated by chrysography. This technique and even certain aspects of the style is reminiscent of the most sophisticated late twelfth-century Byzantine icons, such as the famous Annunciation from Sinai, and a harbinger of much later Palaeologan examples as found in the Anastasis image of the Dodekaorta panels from Florence.[348] The fact is that this icon presents a distinctively Crusader merger of a slightly earlier imperial Byzantine style as interpreted by a Crusader painter, with a rather folksy representation of the somewhat diminutive, almost toylike horses with their tiny faces and the unusual tassels on their legs.



74. Icon: Sinai, App. no. 94/1463: Sts. Theodore and George. (photo reproduced by permission of Archbishop Damianos and the Fathers of the Monastery of St. Catherine, and by courtesy of the Michigan-Princeton-Alexandria Expedition to Mount Sinai)

Finally, there can be no doubt that despite certain clear Crusader aspects of this icon, the donor – who appears to be Greek – wanted it to speak to a Greek audience, because he commissioned all of the inscriptions to be in Greek. Indeed, the artist's apparent patron, kneeling below the equestrian figure of St. George, who is also named George, appears to have the surname, "Parisi," and therefore comes from a Greek family.[349] This is one unusual aspect of this icon, a Greek patron who is named in the Western manner. Another unusual

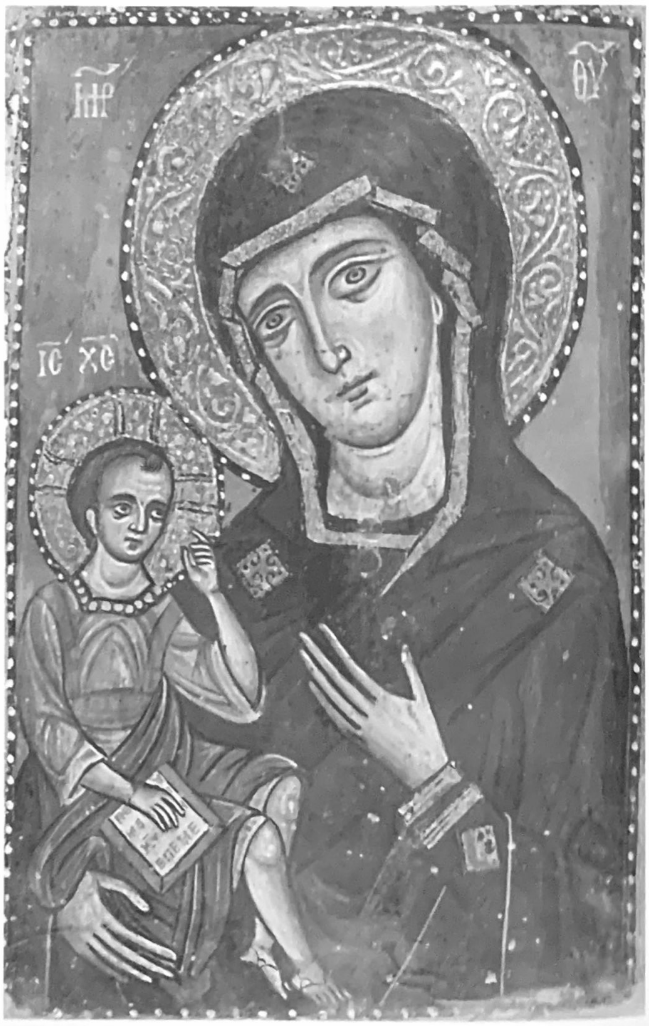


75. Icon: Sinai, App. no. 32/285: Crucifixion. (photo reproduced by permission of Archbishop Damianos and the Fathers of the Monastery of St. Catherine, and by courtesy of the Michigan-Princeton-Alexandria Expedition to Mount Sinai)

aspect is the epithet given to St. George, "diasorites." This appears to be an eponymous epithet, derived from Dios Hieron, a sanctuary of Jupiter in Lydia, where a monastery dedicated to St. George was built. This epithet is not otherwise known in the Crusader East, but can be found on the Greek mainland, on the islands, on Cyprus, and in Serbia from the twelfth century to the fifteenth century. In this case it appears as if the donor must have requested this epithet and perhaps supplied the model for the artist to use. Taken together, this icon has therefore a number of remarkable features that indicate special patronage, but patronage that combines Byzantine and Crusader aspects.[350]

Weitzmann assumed it was a Crusader icon from Sinai, but the style is difficult to compare with other Crusader work found at Sinai, before or after 1250. It is also not impossible that the diminutive donor figure and his identifying inscription has been added a bit later than the original painting of the two knights, but that has not been demonstrated as yet. L.-A. Hunt has, in any case, suggested alternatively that the painter of this icon "was an indigenous eastern Christian, Syrian Melkite, artist working at the behest of the western visitor, probably in the area of Tripoli and Qalamoun during the middle to third quarter of the thirteenth century."[351] Like the icons of St. Marina (Houston) (Fig. 192, App. no. 126) and St. Sergius with a kneeling female (Fig. 199, App. no. 14/80) – both icons of the period, *c.*1250 to the 1260s, to be discussed below in Chapter 6 – Hunt proposes that this icon (Fig. 74, App. no. 94/1463) in style "can be paralleled in wallpaintings in churches in the County of Tripoli and the area of Qalamoun painted by indigenous artists between the 1240s–1270s."[352] This is an interesting possibility that must be considered for the icon of Sts. George and Theodore and may explain the unusual style. The patronage, dating, and exact parallels will, however, need to be studied further, and we shall have to consider how the icon, if done in the County of Tripoli, then made its way to St. Catherine's Monastery on Mount Sinai.[353]

Two other icons have also been proposed to belong to this period in "the early thirteenth century." Both are also modest-sized panels and both are painted on red grounds with boldly decorated frames, which have been suggested to be a pair, even though the frames are different. One is a Crucifixion with a swooning Virgin, a sorrowing St. John, and mourning half-length angels (Fig. 75, App. no. 32/285).[354] The other panel is a bust-length Virgin Hodegetria *Dexiokratousa* (Fig. 76, App. no. 57/679).[355] Mouriki regards both of these icons to be the work of a Syrian Orthodox, not a Crusader artist, but to



76. Icon: Sinai, App. no. 57/679: Virgin Hodegetria Dexiokratousa. (photo reproduced by permission of Archbishop Damianos and the Fathers of the Monastery of St. Catherine, and by courtesy of the Michigan-Princeton-Alexandria Expedition to Mount Sinai)

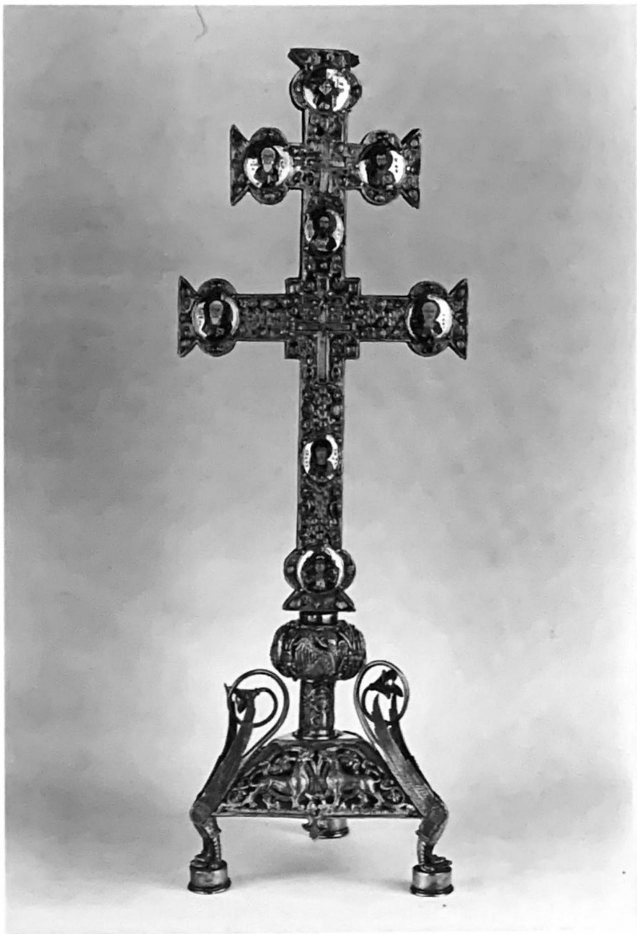
have Crusader characteristics. These features include the combination of Western iconographic elements such as the swooning Virgin, and the knot in the loincloth on the Crucifixion, or the child gesturing with his proper left hand on the Hodegetria, along with the relief decoration in gesso on the nimbi of both panels. The strong designs on the frames of both icons are also typical of Crusader work, either the gilded gesso on the frame of the Crucifixion or the blue and white textile design on the Hodegetria icon.[356] The red backgrounds remind us of Syrian miniatures or Cypriot fresco painting; the white "pearl" borders are frequently found in Crusader panels. All the inscriptions on both icons are in Greek. These traits combined with the Cypriot iconography of the bared legs and the red harness of Christ, and the folksy style also indicate the multicultural richness of these and many other Crusader commissions for which the exact role and function of the panels and their patron are unfortunately unknown. Because of the complexity of these two panels in contrast to those examples discussed earlier, we regard them to be later than 1225, sometime in the later second quarter of the thirteenth century. Accordingly we will discuss them again in Chapter 5.

It is clear from the examples discussed that no uniform style, such as we shall find in a number of icons in the period after 1250 and which may indicate a workshop production style, are discernible in these panels. Just as the dates of these icons, their functions, and their patrons are all somewhat vague and unspecified, or unknown even when named, in these early examples, the panels seem to reflect workshop situations that seem to be not yet fully established where the artists are quite transient. Nonetheless it is important to entertain the possibility that these panels are in fact done in this early period. Whatever the final resolution of the questions of style and date may be, we surely see the characteristic Crusader features in these icons, the same that we find in later panels that can be associated with larger workshop productions in more consistent stylistic groups.

METALWORK AND TEXTILES

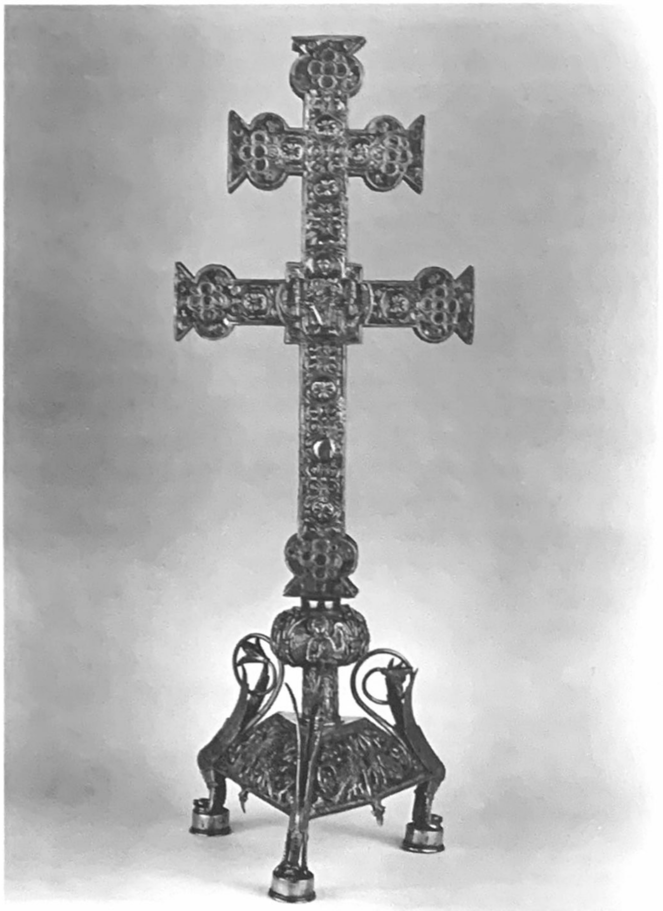
The design and technique of the gilt frame on the Crucifixion icon discussed previously is a sure indication that these artists were thinking of metalwork when doing the panel. The unfortunate problem is that there is very little metalwork from this period for us to consider even though, again, there are some promising indications that metalwork was an artistic medium actively practiced in the Latin Kingdom at this time. We recall that relics were acquired during this period for different reasons, for example, by King Andrew during the early part of the Fifth Crusade to take back to Hungary, or by the Templars for the castle chapel at 'Atlit. In both cases, and especially in regard to 'Atlit with the relics of St. Euphemia, a handsome metalwork reliquary was required, for the presentation and the protection of the holy relics, which so many persons wished to see, and which became an important goal for pilgrims to visit during their visit to the Holy Land.

The most promising potential source of metalwork, and indeed of extant textiles from this period, belongs, however, not to collections related to the kings of Hungary or the Templars. The sisters of Notre Dame de Namur preserve today a remarkable treasury from the Augustinian priory of Oignies.[357] The contents of this treasury was saved from confiscation by the state during the time of the French Revolution in 1794 by being hidden and then was given to the nuns for safe-keeping. The few rich medieval treasuries that were saved, like this one and that at Conques, are eloquent testimony to the otherwise inestimable losses at the time of the Revolution. The treasury of Oignies is of particular interest to us because it contains a number of objects bequeathed to it by Jacques de Vitry. From 1226 to 1229, the former bishop of Acre lived in Liège, while he requested and was officially allowed to resign from his difficult see in Acre by the pope, which he did in 1228. In 1229, Jacques de Vitry was made a cardinal by Pope Gregory IX, demonstrating that he had the full confidence of the pontiff even though he had abandoned his episcopal duties in Acre. Jacques died in Rome on 1 May 1240, and he willed his property to the Augustinian priory of Oignies where he had been a regular canon.[358]



77. Acre: Treasury of Oignies, Gold Cross from Acre, front. (photo: by permission of the Convent of Oignies, Namur, copyright: Institut Royal du Patrimoine Artistique (IRPA/KIK), Brussels)

Most of the objects in this treasury are Mosan goldsmithswork and have nothing to do with the Holy Land. However, there is one cross, which tradition says was given to the treasury by Jacques de Vitry. It is known as the "croix byzantine" (Figs. 77, 78).[359] It is clearly a reliquary of the True Cross, and in its present condition it is a composite work that combines a double-armed cross that has received seven Byzantine cloisonnée enamel plaques on the front face with a triangular base surmounted by a nodule with the four apocalyptic



78. Acre: Treasury of Oignies, Gold Cross from Acre, back. (photo: by courtesy of the Convent of Oignies, Namur, copyright: Institut Royal du Patrimoine Artistique (IRPA/KIK), Brussels)

creatures. No one disputes the Byzantine origin of the enamelled medallions, which are probably to be dated to the eleventh century. Nor is there much doubt that the triangular base of the cross is a Mosan work of the early thirteenth century. However, the double-armed cross itself has been a matter of intense discussion, some among the older scholars considering it to be the work of the Mosan goldsmith, Frère Hugo, or some other Mosan goldsmith working in the spirit of Nicholas of Verdun; some considering the whole cross to be Byzantine, or "orientale."[360] More recent opinion has been more consistent in accepting the enamel plaques as Byzantine and the cross as Mosan work, although the dates suggested for the latter range from the beginning of the thirteenth century to 1230–50.[361]

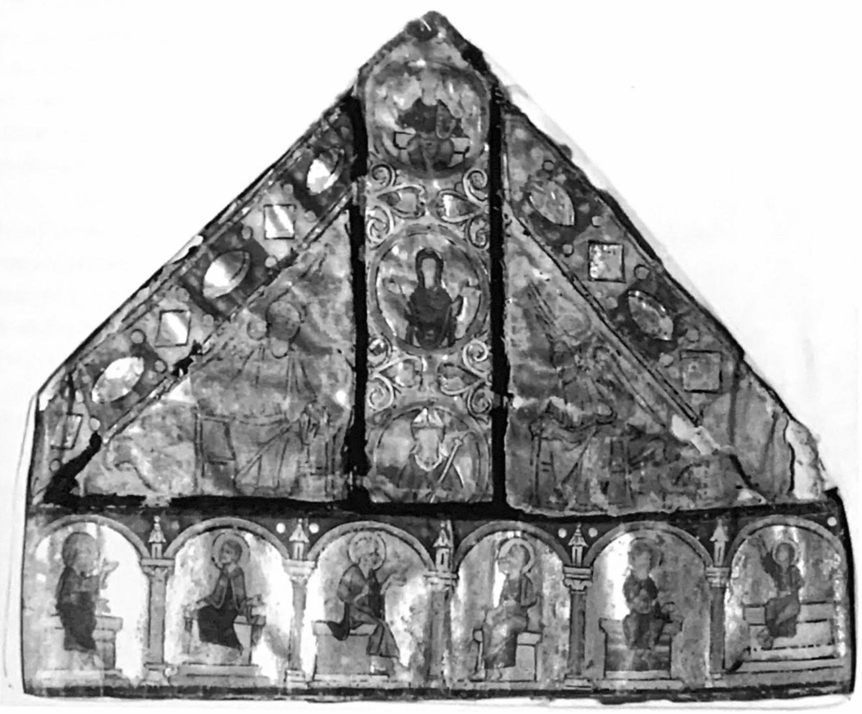
In the face of this near consensus among recent scholars, it is with a certain temerity that I suggest the possibility that the goldsmithswork on the cross may be related to the work of Crusader goldsmiths seen in the later twelfth century. Whereas the shape of the cross is obviously not typical of anything Crusader, other than the double-armed format, and the figural designs are all added – on the front side are the Byzantine enamels and on the back is the roundel of the Virgin enthroned cut and nailed into place in two pieces – the techniques and the repertoire of the ornament on the two sides relate to Crusader work. I invite comparison with the beaded gold filigree work, the use of quatrefoils and circles with floral decoration reminiscent of reliquaries made in Jerusalem in the second half of the twelfth century and now in Santiago da Compostela, Conques, Paris (the Louvre), and Agrigento.[362]

The question is, how can the basic links in technique and decorative repertory be explained? Is it possible that Jacques de Vitry brought back a Crusader reliquary of the True Cross from Acre in 1225 that was subsequently renovated and expanded by his patronage in the Liège region? I insist on the possibility of this link; the problem is to assess whether any of the metal of the cross was brought from the Holy Land, and how to explain the configuration of the reliquary as we see it today, perhaps reworked in the second quarter of the thirteenth century, in the treasury in Namur.

The other interesting objects associated with Jacques de Vitry in this treasury is a set of two miters.[363] Here again I propose to raise issues rather than to solve them. In one case we have an unusual miter made of parchment with a remarkably detailed program of miniature painting executed on the front and back (Figs. 79–81).[364] In this case the later inventory of 1628 is quite explicit about a miter "ex pergameno" that came from Jacques de Vitry, quite an unusual and notable example.

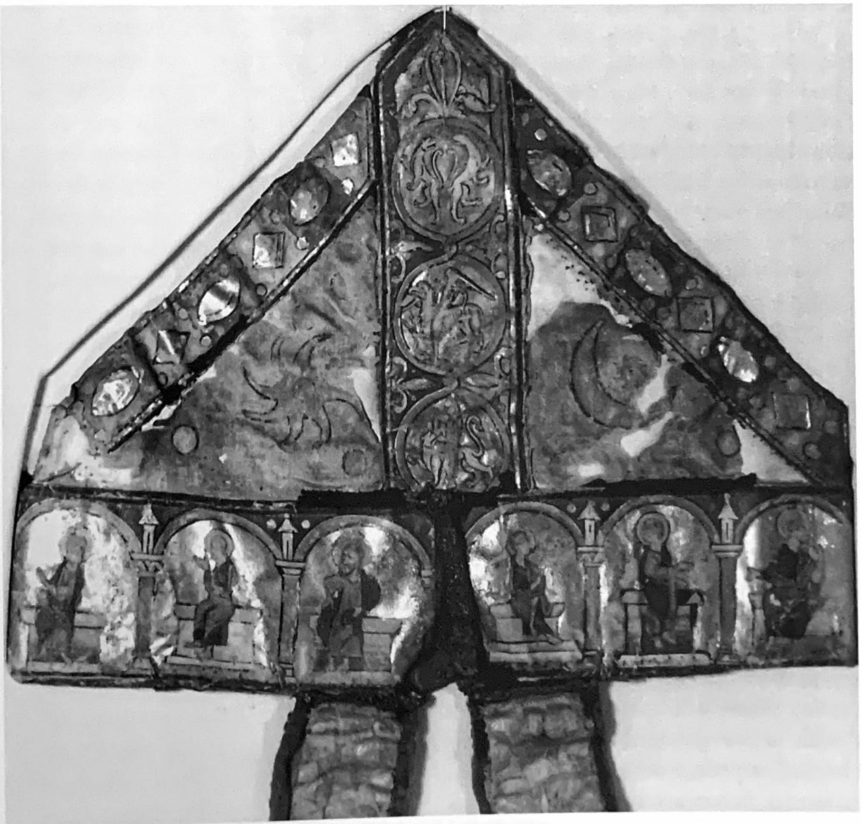
The choice of parchment for the painting is obviously very remarkable and worthy of consideration. Although Jacques de Vitry could no doubt have gotten luxury textiles in the Holy Land where this miter was presumably done, he apparently wanted the lustrous effect of painted gold, not just a textile with golden thread. Furthermore, the use of parchment facilitated the painter's ability to create a program on the mitre with a copious number of figures. Above a line of horizontal arcades in which the Twelve Apostles are seated around the base of the miter, we find on the front vertical element, Christ enthroned above with a bust-length orans Virgin and a bust-length bishop with his crozier below, all three represented in medallions – Christ and the bishop in green medallions, the Virgin in a red one. In the triangular interstices we find the four symbols of the Evangelists, the winged eagle and the winged lion quite diminutive figures in the outer corners, left and right, respectively. However, the winged man and an extraordinary image of an ox-horned winged male-like figure are large seated figures on carpentered wooden thrones. This ensemble of Evangelist symbols is truly unusual in its composite iconographical character, matching the parchment medium as a singular feature.[365] If they have been chosen as this mixed group partly because of the strange and difficult triangular field in which they are placed, the artist must be credited with an innovative and sophisticated creative solution. The angular sides of the miter on both front and back are painted with simulated oval, losenge, and round-shaped precious and semiprecious stones to suggest a sumptuous jewelled and golden episcopal object that would perhaps match, or at least reflect the bishop's liturgical books.

On the back of this miter, we find, above the seated apostles, three fabulous beasts in roundels on the vertical strip, images of the fiery sun and the crescent moon, with smaller round planetary objects, giving the whole ensemble a cosmic reference for the teaching magisterium of the bishop wearing this impressive episcopal liturgical headdress. It is all the more notable, therefore, that the two lappets, hanging below, contain ten additional saints, the top two, bust-length, the lower eight full-length standing male and female figures, with the bottom two each carrying a book and a palm.

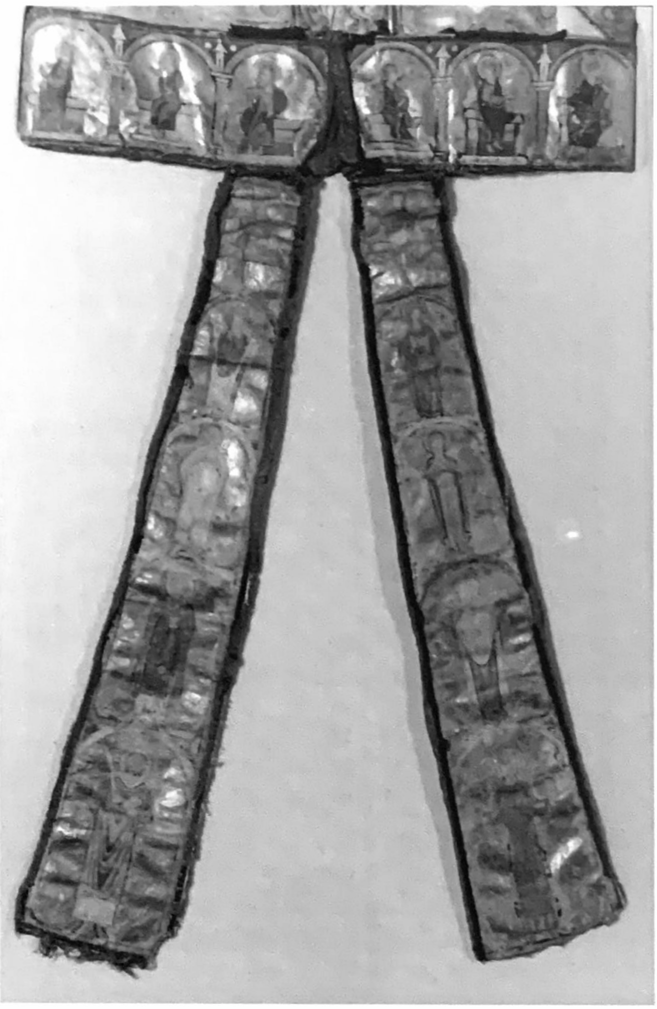


79. Acre: Treasury of Oignies, Parchment Miter of Jacques de Vitry, front. (photo: by courtesy of the Convent of Oignies, Namur)

Courtoy remarks that "cette mitre est unique dans son genre. On n'en connait pas de semblable dans les musées et les trésors d'églises."[366] Its unique characteristics are notable in terms of the unusual material it is made of and in terms of the remarkable program of decoration, a truly grand and universal program to complement and even proclaim the episcopal teaching authority of the bishop wearing the miter. There can be no doubt that the image of Christ enthroned with the Virgin and all Twelve Apostles below, in conjunction with the symbols of the four Evangelists directing attention to the Holy Gospels,



80. Acre: Treasury of Oignies, Parchment Miter of Jacques de Vitry, back. (photo: by courtesy of the Convent of Oignies, Namur)



81. Acre: Treasury of Oignies, Parchment Miter of Jacques de Vtiry, detail, lappets. (photo: by courtesy of the Convent of Oignies, Namur)

could not fail to invest the bishop as teacher, as preacher of the Word, with visual affirmation of his important responsibilities.

F. Courtroy and J. Braun attributed this miter to a French atelier in the north of France.[367] Colleagues such as M. A. Stones, however, describe the style as "byzantine influenced or byzantinizing" and see it as decidedly strange and unexpected in a Western, French setting. Therefore, following the arguments of J. Greven and C. Cannuyer, I suggest that this miter is a work commissioned by Jacques de Vitry while he was in Acre, before his departure in 1225.[368] I propose that this program refers explicitly to his self-perceived role as preacher of the Word, par excellence, as indicated by the appearance of the Evangelist symbols in direct relationship with the bust-length image of the bishop seen on the front of the miter. The singular iconography refers specifically to this role for him as bishop, that is, as a follower of Christ and the Apostles. In addition, the sun and the moon not only give a universal context for his preaching, which in fact Jacques de Vitry carried on in both East and West, but they also relate to his personal insignia as found on his episcopal seals in Acre.[369] Jacques de Vitry employs on the reverse of his seal the image of the sun and moon, instead of the alpha and omega in conjunction with the image of the True Cross often seen on twelfth-century seals of the bishop of Acre. Cannuyer has argued that this iconography, found also on the beautiful portable altar of Jacques de Vitry, which is apparently Mosan work done in the West, was favored by the bishop for a number of works commissioned by him.[370] Finally, the saints decorating the two lappets contain explicit reference to the idea of pilgrimage with which he was familiar in the Latin Kingdom, by virtue of the two saints carrying palms as pilgrims to Jerusalem.

The uniqueness of this miter in terms of the medium, the style of its miniatures, and the powerful message of its iconographic program all reflect the intensity of the activity of Jacques de Vitry in Acre. The idea of the work as being done by French painters from northern France, first proposed by Braun and reiterated by Courtroy, might be valid, but the only way I could understand this possibility is that these artists must have been working in Acre, in a Crusader context with a certain Byzantine influence.[371] Further discussion of this proposal must await futher opportunity to investigate the variety of artistic styles seen on this miter and the codicological character of the parchment.

The other miter in the treasury presents a different set of problems. This example is more conventional in its embroidered technique, with scenes of martyrdom front and back (Fig. 82).[372] The 1628 inventory that in fact mentions two miters in the treasury from Jacques de Vitry, one of parchment and one "ex serico," is much less definitive here, although Courtoy accepts this miter as the other one mentioned. This miter is made of samite, a thick white silk, so it is clearly a good candidate to be the other one referred to as having belonged to Jacques de Vitry.

On the front of this miter is embroidered a scene of the early Christian saint and deacon, Lawrence, martyred on an iron grill by two soldiers under the Hand of God. On the back is the murder of St. Thomas à Becket by three soldiers, again under a Hand of God. There are Latin embroidered inscriptions front and back to identify the saints. The lappets have an interesting representation of large king and queen figures at their ends, with two servant figures above, and a series of five crescent moon decorations alternating with curving floral stems.

Joseph Braun considered this miter to have been done in Sicily.[373] As one of his major considerations, he noted the decorative repertory of the crescent moons embroidered on the material between the front and back scenes, along with the upper part of the lappets. Courtoy says, "on peut hésiter sur cette attribution, car la technique de ce genre de broderie doit avoir aussi été pratiquée dans les ateliers français ou de l'Empire."[374] Obviously the iconography and the identity of the king and queen is of major concern and needs to be examined more closely. Otherwise the program refers to major saints of relevance to a bishop: Lawrence the guardian of the Holy Scripture as deacon; Thomas the recent hero-martyr. It remains to be seen how the imagery of royalty, martyrs, and the crescent moon seen on this miter may be related directly to Jacques de Vitry. We shall hope to find evidence for what the artist intended by the unusual representation of the king and queen and how to account for the copious numbers of the embroidered crescent moons on this liturgical headdress. Certainly the historical arguments relevant to the miter decorated with paintings on parchment discussed previously provide a possible context for this embroidered miter to have originated in the Holy Land as well, although the iconographic and technical evidence is less explicit. If further indications can be identified that link this miter to Jacques de Vitry, the unusual decorative repertory may possibly be explained by the activity of a Sicilian working in Acre.

Finally, we can point out that if both of these miters eventually can be attributed more securely to the patronage of Jacques de Vitry in the city of Acre, then we shall have yet another example of how we need both text and *objets d'art* to inform our knowledge of art in the Crusader East. In the period, 1192–1210 we had only the text of the Antioch inventory dated 1209. Here we have no inventories for 1210–25 from the Latin East, but the likely possibility of extant objects to demonstrate that the commissioning and production of textiles, miniature painting, and metalwork continued in the Latin Kingdom at this time.

COINAGE

Again in the period 1210–25, as in the period preceding, the coinage was quite conservative with one or two major exceptions. As we have seen in the previous period, the king continued the use of the immobilized Amalricus-type deniers, but also minted two new coins discussed in the following. The use of gold bezants imitative of Fatimid coinage continued in the Latin Kingdom. The most important other, nonroyal coinage was again found in Beirut and Sidon, with conservative coin types found farther north in Tripoli and Antioch. In sum, the most interesting new coinage is found in the royal mint.

When John of Brienne goes to Damietta, he apparently mints two new deniers. One, what appears to be the earlier type, of which very few examples have been found, has a crowned figure on the obverse surrounded with the legend, "+IOHANNES REX". On the reverse is found an equal-armed cross with the legend, "+DAMIETA" around it (Fig. 59). Metcalf notes that these coins "are usually found on flans with ragged edges, and poorly struck – possibly signs of haste."[375]

The image on the obverse has been the object of much controversy, but Metcalf is surely correct to see here the "portrait" of the king. Not only do we have the similar type used by Guy de Lusignan, both in Jerusalem and on Cyprus,[376] but also the iconography of the crown is very similar. We find a low isoceles triangle on the head with pendilia. What is distinctive about the iconography used for John of Brienne is the presence of three circles on the crown in the "+DAMIETA" type, and three pellets, presumably meant to represent jewels, on the crown in the "+DAMIATA" type (Fig. 60).[377] In any case, this is unlikely to be a miter as has also been suggested.[378] If the designer had wished to represent an ecclesiastical figure with a miter, he would presumably have shown the head from the side, and represented the miter as two steep triangles, as we find with Bishop Stephen's coinage from the second half of the twelfth century in France.[379]

The significance of this royal coin, and in the one to follow at Damietta, is the reference to "King John at Damietta," not "John, King of Damietta," as Metcalf has pointed out. Metcalf entertains several possible scenarios for this "+DAMIETA" coin, without deciding for certain why there was a change. Although it is not altogether clear why King John of Brienne would have chosen the more Byzantine-type crown for this issue, it is certainly relevant that in making this choice he had the coin type of Guy de Lusignan as a precedent. Furthermore, given the rarity of this coin, and the fact that the evidence appears to suggest that it was made somewhat in haste, I suggest that it was struck during the siege of Damietta, to pay for necessary expenses. Recall that the Crusaders were in camp from May 1218 until November 1219. King John of Brienne was in the Crusader camp for the entire time, and would have needed financial resources to pay for his expenses, before Damietta was taken.

When Damietta was finally captured, John of Brienne was able to establish his royal mint in a more stable setting in the city. With this major change in situation, I propose that he strikes a new coin that reverses the earlier example. Now the obverse contains the equal-armed cross surrounded by the legend, "+IOHES: REX:" with the bust-length portrait of the king on the reverse, wearing a Western-type three-pointed crown, and the legend, "+DAMIATA" (Fig. 59). This is the coin that entered commerce and was circulated throughout the Crusader States in substantial numbers. This is also the coin that John uses to proclaim his new status as ruler in the city of Damietta.

This proposal, that King John minted coins at Damietta, raises once again an issue that certain scholars have found to be quite problematic, namely the notion that the Crusaders from time to time were forced to establish their coin production operations – the minting of their coins – in a military camp situation. We have proposed this at Jerusalem in 1187 before the fall of the city to Saladin, and at Acre before the city was taken in 1191, both in emergency circumstances.[380] Now once again, we find the likelihood that such minting activities were underway in Damietta for King John points to another such situation. I think that this situation at Damietta provides us with the best evidence for the fact that sometimes it was necessary to mint coins in a military camp environment. The earlier coin type of King John is more rare, and the extant examples show signs of hasty minting. These characteristics suggest a coin type that was done in difficult circumstances and for which there may have been a reduced number of coins issued. The later version of the King John coin is better produced, issued in much more plentiful numbers, and is clearly intended to signify the presence of the king in the context of the new conquest. This second type was presumably produced under more favorable conditions in a more secure setting inside the city of Damietta. This evidence at Damietta seems more persuasive in regard to the possibility of minting coins in camp, in my opinion, because of the sequence of and changes in the coins, which seems to fit the differing circumstances of the king, the first situation in camp, the second inside the city.

In any case, the coinage once again demonstrates that artistic activity continues with the Crusaders, even and perhaps especially where the army was in active operation. Our problem in this period of 1210–25, like that of the preceding period, is that, as Metcalf noted, "we have a gap of no less than 40 years in the hoard evidence," from the 1180s into the 1220s.[381] Therefore our access to changes and developments in the coinage is restricted until we move into the next phase, to be examined in Chapter 5.

Patronage and Presence in the Crusader States

We have discussed in Chapter 3 the appearance of the lay confraternity as a possible important new factor in the life of the Crusader States. These confraternities are potentially very significant in relation to the artistic activity in Acre through their role as patrons. In the period 1210–25, the spotlight of evidence falls on a different segment of the Crusader experience, namely the importance of Germans and German contributions to the Latin Kingdom. Germans had been prominent in Jerusalem in the twelfth century, as, for example, with the German hospital there. However, it is an observable fact that when examining the history of the Crusader States in the period from the late twelfth century up until the middle of the thirteenth century, Germans played certain special roles, for example, as pilgrims. From the time of John of Würzburg and Theodorich in the period around 1170, to the time of Wilbrand of Oldenburg, 1212, and Master Thietmar, 1217, German pilgrims present us with the foremost accounts of the Holy Land. Their accounts are the most detailed, the longest, and the most informative with regard not only to the holy places, but also in terms of life and culture in the Crusader Levant, compared to other reports. Complementary to this, it is remarkable that the two most interesting "artistic pilgrims," that is, artists, parts of whose sketchbooks survive, the artist of the Freiburg Leaf in the late 1190s/*c.*1200 and the artist of the Wölfenbüttel Sketchbook, whom we have yet to meet, in the decade of the 1230s, are both apparently German travelers.

The prominent presence of these Germans in the developments of the Crusader Near East cannot be regarded as an anomaly in light of the fact that there was such an important influx of German Crusaders during this time. Not only do we recall seeing the German Crusade of 1197–8, from the ill-fated expedition organized by Henry VI Hohenstaufen, but also we recall the major role played by Crusaders from German-speaking territories in the Fifth Crusade, the Crusade that Frederick II was meant to lead himself.

Furthermore, as we shall see in Chapter 5, Frederick II would eventually make his way to the Holy Land in 1228, and the impact of his visit would last long after his departure, for better or for worse.

Reflecting on these obvious points, we are able to see that Germans played a newly important role in the Crusade movement between the late twelfth century and 1244 in terms of the military and political developments, if not necessarily in the ecclesiastical realm. To some extent we must adjust our assessment of this period accordingly, balancing off the ongoing and continuously important French and Italian presence and the English role in the Third Crusade, with the new prominence of German Crusaders, represented in the Latin Kingdom by the newly established Teutonic Knights, who arrived so to speak at the time of the Third Crusade, when they established their house in Acre, and stayed until 1291.

To some extent we must hark back to the plaintive comments of the pilgrim, John of Würzburg, who chafed from the lack of recognition rendered to his countrymen and commented on it. When discussing the commemoration of the First Crusade in Jerusalem, John bursts out into a long discussion over this issue:

> On the third day is the Anniversary of the Noble Duke of blessed memory, Godfrey, who was the prince and master of that sacred expedition, and born of the German race. The whole city observes this in solemn fashion.... Nevertheless, although every one is anxious for his own honour, the siege of the city is not ascribed to him with any German troops, who were not least in the labours and actions of that expedition, but only to the Franks. Hence also these detractors of our race deleted the epitaph of the famous Wicher, approved by many a famous deed, because they could not deny he was German. They replaced it with the epitaph of some French soldier, as may be seen by any one who goes there. For his coffin is still visible outside at a corner, between the main Church and the Chapel of Saint John the Baptist. But his name is missing, and is replaced by another.[382]

Against this injustice, John provides his own interpretation of what the inscription on the tomb should say:

By Franks, not French, but Germans, all
    More powerful with the sword, I shall
Recount that after long campaign
    Jerusalem was seized again.
The Holy City was set free
    From various pagans' tyranny.
From Franconia, not from France
    Lord Wicher's and Lord Guntram's lance –
Duke Godfrey's too – by this agree
    About the truth of victory.[383]

John of Würzburg then continues with an *apologia* of sorts for why the Germans had not been recognized properly in the Holy Land, which is not necessary to examine here. What is interesting in his account, however, is a certain sensitivity to the claim that German contributions had not been adequately recognized in the Latin Kingdom. He also invites us in effect to reconsider what the proper interpretation of the word "Frank" should be in the Crusader Levant. Finally, perhaps without knowing it, he stands at the beginning of the period, that is, *c.*1170, when the German presence in the Latin Kingdom will become a powerful factor. We have seen this to be the case in the period from 1187 to 1225. It will be even more apparent between 1225 and 1244.

CONCLUSIONS

Far from aiding the Holy Land, the best that may be said of the Fifth Crusade nonetheless was that it did not bring direct harm to the Crusader States. The Fourth Crusade had diverted men and resources away from Syria-Palestine, and had even caused clergy and soldiers to leave for the Latin Empire. The Fifth Crusade had the possibility of the restoration of Jerusalem and the Latin Kingdom as it was before 1187 – except for the territory in Transjordan – in its grasp through repeated offers of a truce by the Sultan al-Kamil. However, the leaders of the Crusade let it slip away, not by the failure of determined efforts, but by their unrealistic refusal to consider anything less than total victory. Damietta, which could have been a major asset to the Crusaders militarily and commercially, was lost after it had been captured. The effort to invade Egypt by the Fifth Crusade thus left the Crusader States, and especially the Latin Kingdom, vulnerable to the attacks of al-Mu'azzam and drained of their manpower and financial resources.

Artistically, we can again see glimpses of lively production and ongoing production. It is clear that just as we found the situation between 1192 and 1210, the circumstances in the Crusader States from 1210 to 1225 seem to offer certain practical and ecclesiastical necessities as the main evidence for artistic productivity. There is especially the architectural rebuilding of fortifications, the construction of new castles, and the ongoing design and minting of coinage. However, as we have seen there is also clear indication that miniature painting, panel painting, fresco and mosaic work, and metalwork and textile production, including liturgical garments, were all active areas as well. Clearly the religious objects predominate, but there is also evidence for remarkable secular work in the palace of Beirut and the widespread use of glazed pottery. Finally, we have seen that there was both local production and internal trade, and the import of Western examples and of works done in the eastern Mediterranean. We can expect these developments to continue and to strengthen and expand when the holy sites are once again reopened to Christian pilgrims by treaty in the period 1229–44.

THE LATIN KINGDOM OF JERUSALEM: 1225–1244

In all Christendom
there is not a more valiant house
than that of the Ibelins.

Philip de Novare

God has delivered the city,
In which the joy of the faith resides.
What more can sinners desire
Than the sepulchre and the glorious cross?

Freidank

THE LATIN KINGDOM OF JERUSALEM FROM THE TIME OF QUEEN ISABEL II, TO THE TREATY OF 1229 AND THE FALL OF JERUSALEM IN 1244

THE LATIN KINGDOM OF JERUSALEM FROM 1225 TO 1229: QUEEN ISABEL II, THE "CRUSADE" OF FREDERICK II, AND ITS AFTERMATH, THE TREATY OF 1229

The marriage of Frederick II with Isabel II in the Cathedral of Brindisi on 9 November 1225 meant that the Latin Kingdom of Jerusalem suddenly did not have a resident ruler, whether king, queen, or regent. Stripped of his position as regent and deprived of his royal duties by Frederick, John of Brienne could only fall on the mercy of the pope for assistance. Honorius III, seeing once again the unpredictable directions that Frederick II was capable of going, found John of Brienne a temporary position in Italy. Meanwhile Frederick II kept his new queen, Isabel II, in Palermo, where she lived far from her native land in Outremer. In due course, on 25 April 1228, she gave birth to a son, Conrad, heir to the crown of Jerusalem. Unhappily, however, a few days after his birth, on 4 May, she died and Conrad became the infant king.[1] Conrad would never see his kingdom. By contrast, his father, Frederick, would go to Jerusalem and personally attempt to claim his son's kingdom. He was Conrad's guardian, and, if the barons of the Latin Kingdom agreed, regent for his son. Frederick, who had been king of Jerusalem by virtue of his marriage to Queen Isabel II, would even audaciously proclaim himself king as guardian of his infant son, but he would find that the Latin Kingdom of Jerusalem was one he could not rule.[2]

Frederick II had first pledged to go on Crusade as far back as July 1215, after his coronation as king of Germany. However, the demands of his involvements with protracted and complicated political and military activity in the West prevented him from honoring his vow, and he never did set out to join the Fifth Crusade (1217–21). Kantorowicz observed airily that "the

emperor's presence would have been of no avail" in averting the catastrophe in the Nile Delta, but the weight of contemporary opinion was otherwise. As the troubadour Peirol wrote: "emperor, Damietta awaits you, and night and day the White Tower weeps for your [imperial] eagle which a [Muslim] vulture has cast down therefrom."[3] Frederick remained committed to the Crusade, however, and in the wake of the disastrous results of that Crusade, eventually he vowed once again to take the Cross, according to the agreements reached at Ferentino in 1223 and then, more specifically, at San Germano on 25 July 1225.[4] He reiterated his determination to proceed with the Crusade at the Diet of Cremona in 1226, along with a policy of suppressing heresy in his domains, and his insistence that his imperial rights be recognized everywhere in the Holy Roman Empire.

The main Crusader army indeed sailed as scheduled in the San Germano accord, from Brindisi in August of 1227. Frederick himself set out shortly thereafter, in early September, only to fall seriously ill. He put in at Otranto in serious distress, and eventually went to Pozzuoli to recover, sending his fleet on to Acre under the command of Hermann of Salza, master of the Teutonic Knights, and the new patriarch of Jerusalem, Gerold of Lausanne. He designated Henry, duke of Limburg, as overall commander of the Crusade until he himself could join the army. He also sent a delegation to Rome, to explain to the pope what had happened.[5]

In the interim, however, Pope Honorius III, his former tutor, had died on 18 March 1227. The new pope, Gregory IX, a cousin of Pope Innocent III, was not prepared to accept any excuses. On 29 September 1227, Gregory summarily excommunicated Frederick II, and the sentence was solemnly proclaimed in an encyclical dated 10 October.[6] His letter leveled a whole list of accusations against Frederick.[7] The most serious were the following: he was accused of violating his sacred oaths to go on Crusade, of being responsible for the sickness and death of many Crusaders who had come to Brindisi to join the army, of delaying the acquisition of ships and supplies, and of feigning illness. Frederick II, for his part, issued a letter defending his situation, and prepared to sail to Outremer in the following spring, in order to join the Crusaders already there. In April 1228, Frederick sent Marshal Richard Filangieri with five hundred knights to the Holy Land in advance of his own departure. Frederick II himself finally left Brindisi on 28 June 1228. The pope had not released him from the ban of excommunication, but at this point Frederick would not let the censure detain him from setting out. Frederick sought to proceed as a Crusader on his own terms; "he made the Crusade into an imperial expedition."[8] The pope apparently could only perceive him to be a political adversary who was attempting to use his Crusader status to his own advantage. "The threat of a Crusade unblessed by the papacy was a threat to the political standing of the papacy, as organizer of holy war and mediatory, . . . between God and man."[9]

As this standoff developed, a power vacuum emerged in the Latin Kingdom, which found itself without a functioning resident ruler. In this situation, John of Ibelin, count of Beirut, assumed de facto leadership of the lords of the kingdom.[10] John of Ibelin already had exercised government leadership previously, once before John of Brienne had arrived in 1210, and again between 1225 and 1228 when John of Brienne had gone West and Frederick had not yet arrived. John at this time was the head of one of the most powerful families in the Latin Kingdom, with strong ties to the royal families of both Jerusalem and Cyprus. He was wealthy and possessed excellent credentials and experience, having formerly also served as constable of the kingdom, having been given the important fief of Beirut in 1198, and having married Melisende, heiress of Arsuf. Because of his stature and his sterling personal qualities, he was recognized by most of the nobles as their leader when the ruler became absent: because of either Queen Isabel II (1225–8) living in the West, King John of Brienne as her regent going to the West, or the infant Conrad after 1228, born in Italy, never coming East. When Frederick II arrived in the Levant therefore, he directed his main efforts to take control in Cyprus and the Latin Kingdom at John of Ibelin, lord of Beirut.

Not only was the royal throne of the Latin Kingdom without a resident occupant between 1225 and 1228, but also the Latin patriarchal throne was vacated by the death of Ralph de Merencourt in 1224. In the interim, Peter, archbishop of Caesarea, administered the church in the Latin Kingdom, and Ralph's successor, Gerold of Lausanne, was finally named in May 1225. He waited to sail eastward with the new Crusade, however, and did not arrive in the East until the fall of 1228. Gerold's qualifications consisted in the fact that he had been the bishop of Valence and, even more impressive, he had served previously as the abbot of Cluny. As he arrived to take charge of the Latin patriarchate in Jerusalem, former proven clergy of the Latin church in the East were being elevated to new positions of importance, perhaps as an indication of increased papal interest and involvement in dealing with Levantine affairs. Simon of Maugastel, the archbishop of Tyre, who had lived in the West for several years after 1225, was named to be the Latin patriarch of Constantinople in 1229. Jacques de Vitry, who had returned to Liège in 1225, was allowed to resign as the bishop of Acre in 1228, and in 1229 he was made cardinal bishop of Tusculum, as we have mentioned earlier. His successor was John of Pruvino, dean of Paris, who arrived at Acre in 1230 after being consecrated in Rome. Some of these ecclesiastical officials were destined to play an active and important role in the upcoming struggle with Frederick II.[11]

When the first elements of the Crusader army arrived in the Levant probably in late September or early October 1227, the papal excommunication of Frederick was just being proclaimed. Shortly thereafter the twenty galleys dispatched by the emperor from Otranto in September also arrived at Acre. When word began to circulate that the emperor was ill, and that he had been excommunicated and would be delayed, the newly arrived Crusaders were alarmed and grew restless. Just as we have seen at the time of the German Crusade in 1197 and the Fifth Crusade in 1217, the first arrivals came with expectations of action, primarily so that they could fulfill their vows and return home. If the Crusade was not going to pursue the goals to which the soldiers had responded in taking the Cross, what was the point of their being here? In the face of the emperor's absence and the constant threat of serious illness in camp, many turned right around, boarded ships and sailed westward. Faced with these problems, Duke Henry of Limburg, Frederick's deputy to lead the Crusade pending his arrival, understood the urgent need to make a decision on what action to take. Although the truce arranged at Damietta in 1221 was still in force, Henry and the other prominent leaders, such as Thomas of Acerra and Bishops William of Exeter and Peter of Winchester,[12] saw the necessity for some kind of military activity. Deciding against a frontal attack on Jerusalem, they sanctioned several lesser operations.

Certain French, English, and Spanish Crusaders for their part marched to the north, past Tyre, to the city of Sidon.[13] The Paris Eracles narrates what happened:

> The pilgrims who were not at Acre, not wanting to be idle, took counsel and agreed that they should go to Saete [Sidon]

> to fortify the city and the castle. When they arrived, they realised that it would be too much work to undertake the fortification of the town and castle. They saw an island in the sea beyond the harbour and they knew that they could make a better and more secure fortification there in a short time. They set to work and built two towers, one large and the other medium, and a length of wall between the two towers. They worked at this between St. Martin's day [11 November 1227] and the middle of Lent [2 March 1228].[14]

This is, of course, the famous "sea castle" at Sidon, built on a reef located about 100 meters offshore at the mouth of the harbor. Much of what we see today is construction done later in the century, but part of the core of the castle is surely the work described in the Paris Eracles.[15]

While work on the sea castle at Sidon was getting underway, a contingent of German Crusaders marched into the hills some 20 kilometers to the northeast of Acre where the Teutonic Knights had identified a site for their new headquarters.[16] Eschewing the urban setting, unlike the Hospitallers and the Templars who had their headquarters in Acre, Hermann of Salza decided on an isolated and eminently defensible castle for their administrative center in the Latin Kingdom. It is located on a narrow rocky spur rising abruptly 180 meters above the Wadi al-Qarn. Preliminary work to prepare the site may have started already in 1226 soon after the exchange of lands that gave the Teutonic Order the possession of this strategically located spur. However, it was with the manpower provided by a contingent of newly arrived German Crusaders that heavy work got underway in late 1227, possibly starting with digging the foundations. Even so, the serious construction must have mostly been carried out in 1228 after the rainy season was over. Phase one of the construction, which is probably what was executed in 1228, has been identified by Pringle to consist mainly of the purely defensive architecture, such as the keep and the inner bailey wall. Although Montfort, known as Starkenburg in German, was obviously an important castle, we do not know exactly when it was finished, but it was certainly fully operational in the 1240s. It was held by the Teutonic Knights until it was captured and heavily destroyed by the siege engines of Sultan Baybars on 4 July 1271.[17]

Later, in 1228 additional work was undertaken to the south of Acre by the Crusaders. Part of the army marched along the coast to begin refortification of the cities of Caesarea and Jaffa.[18] The fortifications of Caesarea had been worked on by members of the Fifth Crusade in 1217, but al-Mu'azzam had inflicted more damage in 1219–20. Now in the spring of 1228, work on the walls started once more. Work at Jaffa, also apparently begun at this time, was pursued more substantially in the fall of 1228 when Frederick II finally arrived.[19]

On 11 November 1227, just as the work at Sidon was beginning, al-Mu'azzam, the redoubtable Muslim ruler of Syria, died. This development greatly aided the Crusaders in one sense, because now Sultan al-Kamil in Egypt sought immediately to acquire the Syrian territory of his late brother, which passed to al-Mu'azzam's twenty-one-year-old and inexperienced son, an-Nasir Daud. While the Muslim rulers of Egypt, Syria, and the Jezirah were preoccupied with this power struggle, Crusader building activities could go on uninterrupted. However, from a different point of view the death of al-Mu'azzam was also a problem for the Crusaders because it strengthened al-Kamil's hand in Syria.

Sultan al-Kamil had, already in 1226, sent one of his trusted emissaries to open discussions with Frederick II. Emir Fakr ad-Din had come to Frederick II in Sicily where he sought the emperor's support against al-Mu'azzam, who had at that time recently allied himself with the leader of the Khwarismian Turks along his eastern border, thereby alarming his brother in Egypt. Al-Kamil's other brother to the north, al-Ashraf, was at this moment unable to consider a joint operation to divide al-Mu'azzam's Syrian holdings by force between them because of his own commitments, so al-Kamil turned to Frederick for possible assistance. To entice the emperor, he held out the prospect of restoring Jerusalem to the Christians, just as he had repeatedly done earlier during the Fifth Crusade. In 1226 Frederick was interested, but, contemplating his upcoming Crusade and faced with problems in Italy, he could do nothing at the time.

In May 1227 al-Mu'azzam was again sufficiently concerned about the possibility of Jerusalem being returned to the Crusaders, one way or other, that he ordered the demolition of the walls of the Holy City, work started in 1219, to be completed. A partial destruction of the citadel, but not the Tower of David – the only major fortified tower of the city to survive this period undamaged – may have been the demolition work undertaken at this time.[20] However, by November of 1227 when al-Mu'azzam died, the situation changed substantially. Al-Kamil saw his way open to proceed with the annexation of Syrian lands. Now he did not need Frederick's help with the same urgency as he had before. What would happen to Jerusalem now, and how would he welcome Frederick to Syria in 1228? Frederick for his part was determined to come to the Holy Land and recover Jerusalem, although the pope could not believe it.[21]

Frederick II finally sailed from Brindisi for Outremer on 28 June 1228, via Otranto, and the islands of Corfu, Cephalonia, Crete, and Rhodes.[22] When he received confirmation of Frederick's departure, the pope commented that he went unreconciled to the Church and that no one knew where he was going. Frederick II, writing to his subjects, reported: "With Christ as our leader we have just left Brindisi for Syria, sailing swiftly before favourable winds."[23] He arrived off Limassol on Cyprus on 21 July 1228, after a voyage of twenty-four days.

Frederick's first step in the Levant was to establish imperial sovereignty over Cyprus. It would be a sobering example for the lords of Outremer to see the methods he was prepared to use to carry out his policies. According to the Paris Eracles, "Li empereres fu receuz a Limecon a grant joie et a grant honor." After being met by his marshal, Richard Filangieri, and other nobles, and having received their homage, Frederick, taking the initiative as always, invited the *bailli* of the kingdom of Cyprus, John of Ibelin,[24] with his sons, the young king of Cyprus, Henry I, and a number of the nobles to a banquet. Despite warnings by his friends of possible danger from the emperor, John of Ibelin correctly saw it to be his duty to be present. Frederick sent cordial greetings and requested that the Ibelins put aside their black robes of mourning for Philip of Ibelin, who had died in 1227. He sent them handsome robes of scarlet to wear.

The banquet was equally lavish. Philip de Novare recorded the events in some detail. The location ironically was in a house that had been built by Philip of Ibelin. John of Ibelin was placed at the head table with the emperor, and the king of Cyprus and the Cypriot knights were seated so they could see and hear the two of them when they spoke. When the dining was over, Frederick ordered his soldiers to take possession of the house and the banquet hall by standing behind each of the guests with their weapons drawn. Philip de Novare describes the dramatic confrontation:

> The Cypriots took good note but did not say a word, and they strove to give the appearance of ease. The emperor turned his face towards the lord of Beirut and said loudly to him: "Sir John, I wish to demand of you two things; you will do them agreeably and well if you know what is wise." And he replied: "Sire, speak your pleasure, and I shall do willingly that which I consider to be right, or what honest men so deem."
>
> "One of the two things," said the emperor, "is that you surrender to me the city of Beirut, for you do not have and hold it by right. The other is that you render to me all that the bailliage of Cyprus and the rule thereof has profited and brought you since the death of King Hugh; that is, the revenues for ten years; for it is my right according to the usages of Germany." The lord of Beirut replied: "I believe that you jest and make sport of me; and it may well be that certain evil men who hate me have suggested this demand, and because of this it has been made by you; but, as God wills, you are so good and wise a lord that you know to whatever extent we are able to serve you we will do so willingly, and so you will not believe them." The emperor put his hand to his head and said: "By this head which many times has worn a crown, I will accomplish my will in these two things which I have asked or you shall be taken a prisoner."
>
> Then the lord of Beirut arose and said in a loud voice with commanding presence: "I have and I hold Beirut as my rightful fief; for as much as my lady Queen Isabelle, who was my sister through my mother and daughter of King Amaury and thus legal heir to the kingdom of Jerusalem, together with her lord King Amaury gave me Beirut in exchange for the constableship, when the Christians had recovered it all destroyed so that the Temple and the Hospital and all the barons of Syria had refused it. I fortified it and maintained it by the alms of Christians and by my own work, and always I used and consumed therein whatever I had in revenues in Cyprus and elsewhere; if you contend that I hold it illegally, I will furnish you proofs and rights thereto in the court of the kingdom of Jerusalem. Of what you require of me concerning the revenues of the baillage of Cyprus and the rule thereof, I have never had any, and my brother as bailli had never aught save the trouble and the labor of the government of the kingdom, but Queen Alice, my niece, had the revenues and disposed of them at her own will, as the one who legally held the baillage according to our usage; and if you demand of me the right of this, I will furnish you proofs by the usage and by the court of the kingdom of Cyprus; but be certain that for fear of death or of prison will I not do more unless the judgement of the good and loyal court requires me so to do."...
>
> The emperor was much enraged and changed color often, and people looked often at the lord of Beirut and many were the words and threats; and the men of religion and other good men intervened to reconcile them, but in no way could they change the lord of Beirut from that which he said he would do. The emperor made several strange and menacing demands. In the end it was agreed as the lord of Beirut had previously offered, and no more could force prevail than that he should surrender to the emperor twenty of the most prominent vassals of Cyprus, who pledged with their bodies, goods, and estates, that the lord of Beirut would serve him and would go to the court of the Kingdom of Jerusalem and there furnish his proofs; and only when he should appear in the court were the hostages to be freed and released.[25]

In this manner the Holy Roman Emperor made his personal entry into Outremer. Here we see, as Jonathan Riley-Smith has written, "a man who had a strong will and was capable of ruthless and arbitrary acts, but was motivated by conservative ideas, determined to enjoy what he took to be established imperial or royal rights, and although these rarely coincided with the baronial interpretation of law and custom it does not follow that they were indefensible."[26]

If John of Ibelin could not be cowed, the fact was Frederick still needed to establish his exercise of power on Cyprus and he still needed money for his Crusade. For the remainder of July and August, Frederick summoned others to do his bidding, while John of Ibelin retired discreetly, first to Nicosia and then the Castle of St. Hilarion, which guarded the mountain pass north to Kyrenia, staying out of harm's way. Meanwhile Frederick was recognized as suzerain of Cyprus, and the king paid him homage, and although Alice was still regent, the emperor appointed new *baillis* to govern the towns and the country. Eventually the emperor made his peace with John of Ibelin, whose power and influence on Cyprus was, however, now at an end.[27] As John LaMonte characterized the situation, "Prior to this time, John had been at most an important baron in an unimportant kingdom; thereafter, as the defender of the baronial liberties against imperial aggression, he became a figure of international significance."[28] John for his part proceeded to serve Frederick correctly, albeit cautiously, during the emperor's time in the Levant, as his vassal in the kingdom of Jerusalem.

The emperor had successfully claimed his suzerain rights over Cyprus, rights deriving from the creation of the Lusignan kingdom on Cyprus by Henry VI. He also tried without success to get Bohemond to do him homage for Tripoli and Antioch, but Bohemond recognized no overlord save perhaps the Latin Emperor of Constantinople. At this point, Frederick was anxious to move on to Palestine where he intended to claim rights as king of Jerusalem. On 3 September 1228 he sailed from Famagusta to the Latin Kingdom. Frederick was welcomed at Tyre and Acre, and as Philip de Novare reports: "The emperor was very well received in Syria and all did homage to him. He left Tyre and went to the city of Acre, and was received there with honor."[29] In fact though he was initially well received in Acre on 7 September as the leader of the Crusader army and the main hope for the restoration of Jerusalem, the clergy would not render him the kiss of peace because of the ban imposed on him by the pope.

When Frederick sought to organize the Crusaders for action, problems developed because of his excommunication.[30] The Teutonic Knights, the Sicilians, the Pisans, and the Genoese were committed to the emperor, along with other firm supporters, such as the bishops of Winchester and of Exeter. In fact, Peter des Roches, bishop of Winchester, made his biggest contribution to this Crusade in Acre by transforming the Hospital of St. Thomas the Martyr into a military establishment organized according to the rule of the Teutonic Order.[31] However, the Templars and Hospitallers, along with the clergy of the Latin Kingdom, refused to recognize Frederick's command because he was excommunicated. Others wavered, and even though Frederick attempted to win recruits for his Crusader army by appointing commanders who were untainted by his status – namely, Herman of Salza, Master of the Teutonic

Knights, Richard Filangieri, Frederick's marshal, and Odo of Montbéliard, constable of the kingdom – he was unable to raise a very large army. Even when Frederick was persuaded to appeal to the pope for absolution from his ban, sending as his emissaries to Rome the bishop of Bari and the admiral of the Sicilian fleet, a papal letter to the patriarch of Jerusalem and to the masters of the knightly orders warned them not to have any part in Frederick's activities in Syria.[32] Meanwhile Frederick learned that the pope was preparing an army commanded by John of Brienne to attack his kingdom of Sicily.

In light of these developments, no doubt Frederick II could see the course of action he would have to take at this point. Whereas on the one hand he wished to claim rights to the kingdom of Jerusalem and to legitimate this claim by personally restoring Jerusalem to Christian control, on the other hand, it must have been clear that he would not be able to do this by force of arms alone and that he would have to rely heavily on diplomatic initiatives. Furthermore in light of events in the West, time was of the essence; far from being a multiyear campaign, his Crusade would have to reach its goals efficiently and with all deliberate speed. To this end he sent Thomas of Acerra and Balian of Sidon as his emissaries to al-Kamil, announcing his arrival in the Holy Land and expressing his interest in continuing the discussions that had been underway between the two rulers since 1226.[33]

Ibn Wasil reports the following:

> When the Emperor reached Acre, al-Malik al-Kamil found him an embarrassment, for his brother al-Malik al-Mu'azzam, who was the reason why he had asked Frederick for help, had died, and al-Kamil had no further need of the Emperor. Nor was it possible to turn him away and attack him because of the terms of the earlier agreement, and because this would have led him to lose the goals on which his heart was set at the time. He therefore made a treaty with Frederick and treated him with great friendship.... The Emperor settled at Acre and messengers came and went between him and al-Malik al-Kamil until the end of the year.[34]

The making of a new treaty thereby remained a goal and was a process that took several months of personal negotiations between Frederick and al-Kamil, with Emir Fakr ad-Din playing an important role. The positions of the two rulers as described by Ibn Wasil were quite different. An agreement had to be worked out through extended discussions and the exchange of gifts; there were feints and counterfeints and hard bargaining. In the end both rulers would have to appear to have won important gains and to have yielded nothing of importance. The emperor was unwilling to leave the Holy Land except on the conditions that Jerusalem was surrendered to him along with at least part of the area taken by Saladin that was still in Muslim hands. Al-Kamil needed to avoid a war with the Franks and sought to neutralize them, so he could get on with his campaign to annex the Syrian lands now held by an-Nasir Daud. As he saw it, any territorial concessions he decided to make at this point could be regained later, when the Crusaders had gone home.[35]

In late November, Frederick attempted to apply pressure by initiating a military operation to Jaffa, as a putative staging point for a possible attack on Jerusalem he knew he would not order. He organized the troops that were willing to follow him and marched to the south to refortify and further garrison the city. But al-Kamil refused to be bluffed. He knew of Frederick's troubles with the pope, and by extension with the Templars and the Hospitallers, and he complained that the emperor had attacked Muslim villages en route. Frederick had to pay reparations before the negotiations could continue.[36]

Frederick persisted with the negotiations. He attempted to impress the sultan with his intellectual prowess and knowledge of philosophy, geometry, mathematics, and poetry.[37] He literally competed with the sultan in the exchange of gifts.[38] Indeed the patriarch of Jerusalem complained bitterly to the pope: "It is with the greatest shame and disgrace that we report to you that it is said the Sultan, hearing of the Emperor's enjoyment of living in the manner of the Saracens, sent to him singing girls and jugglers, persons who were not only of ill repute but unworthy even to be mentioned among Christians."[39] Frederick sought to enhance his personal friendship not only with Sultan al-Kamil, but also Emir Fakr ad-Din. In the end Frederick's efforts proved to be rewarded in the sense that he is reported to have persuaded al-Kamil of the following proposition:

> I am your friend. You must be aware that I am supreme among all the princes of the West. It is you who caused me to come here. The kings and the pope know of my expedition. If I return without having obtained something, I shall lose all respect in their eyes. After all, is not the city of Jerusalem the place of birth of the Christian religion? Have you not destroyed it? It now stands in direst need. Give it back to me in the condition in which it is so that upon my return home I may hold my head among kings. I renounce in advance all advantages which I might obtain from it.[40]

As the negotiations stretched on into early 1229, Frederick's situation became more pressing. Reports were received from Italy where John of Brienne was said to have captured San Germano and had moved on to threaten Capua. Frederick intensified his efforts, and on the advice of Emir Fakr ad-Din, he sent his premier emissaries, Thomas of Acerra and Balian of Sidon, to al-Kamil once more. On 11 February al-Kamil proposed terms that Frederick could and did accept.[41]

Philip de Novare reports this activity quite succinctly:

> The emperor, his men, and all the men of Syria left Acre to go to Jaffa, and there they made terms of truce with El Kamel, who was then sultan of Babylon [Egypt] and Damascus [sic] and who held Jerusalem and all the country; thereby were surrendered Jerusalem and Nazareth and Lydda to the emperor.[42]

Indeed, the culmination of Frederick's negotiations with Sultan al-Kamil was a major treaty that achieved a number of remarkable results. This Treaty of Jaffa was concluded on 18 February 1229. No full text of the treaty survives, perhaps because it was a personal arrangement between the sultan and Frederick. Indeed it had been secretly arranged between the emperor and the sultan; neither the Muslim emirs nor the Christian clergy or lords had been consulted in its preparation or about its provisions. It depended on the personal relationship between al-Kamil and Frederick for its implementation. John La Monte reconstructed the provisions of this treaty from a variety of sources and he usefully summarizes the essential content as follows:[43]

> (1) The sultan delivered over to Frederick or his officers the city of Jerusalem;

(2) the Temple Area, including the Dome of the Rock, was reserved to the Moslems, who were to be free to exercise their religion there unmolested;
(3) Moslems were to be allowed free right of pilgrimage to shrines at Bethlehem and other holy places of their religion;
(4) Franks should be allowed to enter the Temple Area for the purpose of prayer, provided they showed proper respect for "the dignity of the Temple of the Lord";
(5) Moslems in Jerusalem were to have their own court to which they were amenable;
(6) The emperor promised to remain neutral in any war which might be waged against the sultan and not to assist anyone against him;
(7) The emperor should forbid any of his subjects to make war against the sultan and [restrain] anyone who proposed to do so;
(8) The emperor pledged himself to enforce the terms of the treaty and prevent any breach of the truce;
(9) Tripoli, Antioch, Tortosa, and the castles of Safita, Margat, and Crac (castles belonging to the Temple and Hospital) should be left as they were (i.e. excluded from the treaty), and the emperor should prevent his subjects, Syrians and others, from assisting the lords of these territories against the sultan;
(10) St. George (Lydda) and the villages between it and Jerusalem should be restored to the emperor;
(11) Nazareth and the villages between it and Acre should be restored to the emperor;
(12) Toron with its lands and villages should be restored;
(13) Sidon and its vicinity should be restored;
(14) Bethlehem and the villages between it and Jerusalem should be restored;
(15) The walls of Jerusalem, Jaffa, Caesarea, and Montfort (a castle of the Teutons) might be rebuilt by the Christians (though Makrizi states that the city of Jerusalem was not to be fortified);[44]
(16) No new fortresses were to be built nor were any old ones to be reconstructed by the Egyptians during the time of the truce;
(17) There was to be a complete exchange and restoration of prisoners, including many of those captured in the Damietta campaign;
(18) The truce was to last for ten years, five months, and forty days.[45]

This last provision meant that the truce was to be in force from 18 February 1229 to 27 August 1239. According to Muslim law, it was acceptable for truces with nonbelievers to last for ten years with reference to a precedent set by Mohammed in 628.[46]

The fact is that by this treaty Frederick II made a signal accomplishment for the Latin Kingdom; indeed, "as a second Heraclius he had brought Jerusalem back into the Christian fold."[47] Nonetheless, because of the way the treaty had been privately negotiated, there were many misgivings about its provisions, once they became generally known. Furthermore, because Frederick was excommunicated and dealing personally and directly with the Muslim ruler, many Christians including a number of the most prominent resident Crusaders – clergy and soldiers alike – were distressed by the content of this treaty, so remarkably different from its predecessors. Yet although Crusader access to Jerusalem and the holy places had been part of treaties proposed by al-Kamil, stretching back to the time of the Fifth Crusade, no negotiation to this point had successfully resulted in reopening Jerusalem to the Crusaders as this treaty of Jaffa did. What irony that it was Frederick II who accomplished it! (Map 4)

Whereas Christian pilgrims welcomed the new access to the holy sites, Gerold, the patriarch of Jerusalem, the clergy of the Latin church, and the members of the Hospitallers and especially the Templars found this treaty deeply problematic and quite unacceptable.[48] Not only did the agreement permit the Muslims rights to worship in Jerusalem with their own court, but also Frederick had agreed in effect not to mount any Crusade attacks on the Muslims in Egypt, and to restrain any other Christians in the Latin Kingdom from doing so. Furthermore, obviously the Templar headquarters in Jerusalem remained in Muslim hands, and Frederick II had made no effort to negotiate the restoration of Church lands surrounding the three holy places of Jerusalem, Bethlehem, or Nazareth, so the economic problems of supporting these important pilgrimage sites were unresolved. We can recall that there had been substantial opposition to a possible treaty with al-Kamil during the Fifth Crusade when he proposed to return Jerusalem and all the lands of the Latin Kingdom conquered by Saladin, but not the castles *oultrelejourdain*, that is, Shaubak and Kerak. Now the sultan had conceded much less, only corridors of access to Jerusalem and Bethlehem, Nazareth, and Toron, which the Crusader lords wondered how they would defend. Finally, the private negotiations by which this treaty had been arranged meant that neither the clergy nor the religious orders nor the nobility of the kingdom had been involved on the Crusader side; indeed only Frederick had signed for the Crusaders. As for the Muslims, only al-Kamil had signed the accord, not the ruler of Damascus, his nephew an-Nasir Daud.[49]

There was consternation in the Muslim world as well. A great Muslim preacher living in Damascus at the time reported:

> News of the loss of Jerusalem spread to Damascus, and disaster struck all the lands of Islam. It was so great a tragedy that public ceremonies of mourning were instituted: al-Malik an-Nasir Dawud invited me to preside over a meeting in the Great Mosque of Damascus and to speak of what had occurred in Jerusalem.... It was a memorable day, for not one of the people of Damascus remained outside. In the course of my oration I said: "The road to Jerusalem is closed to the companies of pious visitors! O desolation for those pious men who live there; how many times have they prostrated themselves there in prayer, how many tears have they shed there! By Allah, if their eyes were living springs they could not pay the whole of their debt of grief; if their hearts burst with grief they could not diminish their anguish! May God burnish the honour of the believers! O shame upon the Muslim rulers!"[50]

Al-Kamil issued a proclamation saying that the Muslims were to leave Jerusalem and hand it over to the Crusaders, which they did "amid cries and groans and lamentations."[51] The sultan defended his concessions in this treaty by saying, "'We have only... conceded to them some churches and some ruined houses. The sacred precincts, the venerated Rock and all the other sanctuaries to which we make our pilgrimages remain ours as they were; Muslim rites continue to flourish as they did before, and the Muslims have their own governor of the rural provinces and districts.'"[52]

Frederick wasted no time in requesting permission from al-Kamil to go to Jerusalem. The sultan appointed the qadi of Nablus, Shams ad-Din, to be responsible for handing over the city to him, to escort him during his visit, and to be at his service. Frederick entered the city on 17 March 1229, a little over a month after the treaty was concluded. He was accompanied by his imperial troops and members of the Teutonic Order, along with his Sicilian bishops and two English bishops, and a contingent of pilgrims. He was handed the keys to the city by Shams ad-Din, in the name of the sultan, al-Kamil. Frederick took up residence in the hospital, opposite the Church of the Holy Sepulcher.[53]

On 18 March 1229, Sunday in mid-Lent, Frederick II, still excommunicated, entered the Church of the Holy Sepulcher. The Paris Eracles describes what happened with certain unique details:

> li empereres . . . s'en entra ou mostier dou Sepucre et fist metre une corone d'or dessus le maistre autel dou cuer, et puis vint la, si la prist et la mist sur sa teste.[54]

We are not told in other sources that the crown was gold, where the crown was placed in the Church of the Holy Sepulcher before the emperor wore it, or how the crown was placed on his head. The details in this account suggest that this author had access to quite specific information about this event, or even that he might have been present in Jerusalem at this time. Thus, without the presence of the patriarch or other priests, without the benefit of the liturgy, Frederick II wore his imperial crown at the center of the world in the Church of the Holy Sepulcher. Frederick II stated what he did in a letter to King Henry II of England:

> On the seventeenth day of the month of March . . . we entered the Holy City of Jerusalem, and there as Catholic Emperor, on the next day, after worshipping at the Sepulchre of the Lord, we wore the crown which God the Omnipotent through his special grace, provided for us from his majestic throne.

Hans Mayer has argued persuasively that Frederick's actions here should be regarded as the ceremonial act of crown-wearing, just as the emperor describes them in the letter to Henry. It is a royal act customarily seen on the great feasts, but also performed on other important occasions, and this certainly was an important occasion for the emperor.[55]

By force of will therefore, he now claimed to be not only father and guardian of Conrad, but also regent for Conrad, king of Jerusalem, which the lords of the Latin Kingdom could recognize. He was also of course the Holy Roman Emperor and wore the crown recalling the legend of the last emperor in Jerusalem.

It is interesting to note that we have very little indication of what kind of crown he actually wore at this momentous event. Although all the chroniclers mention it and it seems to have caught the attention and imagination of people, there were obviously very few eyewitnesses, and none describes what exactly the crown looked like.[56] It is highly unlikely that this was a new crown of the kingdom of Jerusalem, recently made for this occasion, or an older crown, part of the regalia from earlier times.[57] It is much more likely to have been an imperial crown that belonged to Frederick that he brought with him and supplied for this special event. Given the stormy and adversarial relationship he had with the patriarch Gerold at this point, and the fact that far from facilitating Frederick's presence in the Holy City, he had attempted unsuccessfully to block him from being there, it is quite impossible that the emperor would have access to the regalia of the Latin Kingdom. If, as is likely, he himself supplied the crown, we would like to know whether this "corone d'or" was a special royal crown or an imperial crown.[58]

Following his crown-wearing, Frederick II left the Church of the Holy Sepulcher and had an address read to the people on his behalf by Hermann of Salza, master of the Teutonic Knights, first in Latin and then in French. The content of this speech was amazingly conciliatory toward the pope; indeed he forgave the pope for proclaiming the ban of excommunication against him, because as he says, the pope could not have known of his true intention to fulfill his Crusader vow faithfully. Despite this magnanimous and politically astute gesture of reconciliation toward Gregory IX, Frederick was about to feel the weight of yet another ecclesiastical blow with the intent to discredit him.

Once Frederick and al-Kamil had concluded their treaty on 18 February, Frederick had sent an abstract of the text to the patriarch of Jerusalem, Gerold, hoping for his approval. Far from reconciling Frederick with the patriarch, however, the treaty threw Gerold into a rage, mainly because of the idea of treating with the infidel Muslims as equals rather than as enemies to be subjugated and destroyed. Gerold ordered Peter, the archbishop of Caesarea, to place the city of Jerusalem under an interdict. But Gerold was too late. Frederick had staged his triumphal entry into Jerusalem without delay, on 17 March. Although the interdict ostensibly had been issued to prevent the army and the pilgrims from entering the Holy City with the emperor, when it finally was declared, on 19 March,[59] it had the effect of denying access to the holy liturgy to the pilgrims and Crusaders who were already there, much to their consternation and resentment. Mass could now only be celebrated outside the city walls, for example, at the Tomb of the Virgin in Gethsemane, or west of the city in the Monastery of the Holy Cross.

Frederick II had accomplished his principle goals in Jerusalem. After visiting the Muslim holy places in the Haram al-Sharif, he summoned the major representatives of the kingdom to give them his report on the state of the realm under the new treaty. He also wished to discuss the possible rebuilding of the defenses of the Holy City,[60] but in the face of open disapproval over the treaty, he retained Odo of Montbéliard as constable of the kingdom and abandoned any attempt to consider refortifying Jerusalem.

Wishing now to return home as soon as possible to defend his kingdom of Sicily against the invasion of papal forces currently getting underway, Frederick marched rapidly to Acre via Jaffa. When he arrived, he discovered the patriarch Gerold engaged in raising mercenary troops to defend the kingdom, an activity that plainly contravened the provisions of the new treaty. Frederick would not tolerate this breach of his authority and he attacked both the patriarch and the Templars and their supporters in Acre, creating thereby a brief civil war during April. It was a bad omen for the future. Thereafter he rapidly completed his affairs, first with regard to Cyprus. He leased the *baillage* to Amaury Barlais and his four colleagues, Amaury of Bethsan, Gauvain of Chinchi, William of Revet, and Hugh of Gibelet, for three years. He established a garrison in Acre to protect imperial interests. The Teutonic Order was given possession of Montfort, as a stronghold from which they might dominate the city of Acre.[61]

At sunrise on 1 May 1229 Frederick boarded his ship in the harbor of Acre to sail home. Philip of Novare tells an incredible story of popular disapproval expressed directly to the emperor as he departed.

> The emperor arranged for his passage secretly, and on the first day of May at dawn, without letting it be known by anyone, he got into a galley before the street of the butchers. Whence it happened that the butchers and the old people of the street, who were most ill disposed, ran along beside him and pelted him with tripe and bits of meat most scurrilously.
>
> The lord of Beirut [John of Ibelin] and Sir Eudes de Montbéliard [constable of the kingdom] heard talk of this; and they hurried there and drove away with blows those who had been throwing things at him, and they cried to him from the land to where he was on the galley that they commended him to God. The emperor replied in so low a voice that I do not know whether it was well or ill; he said that he was leaving as baillies in his place the lord of Sidon and Garnier l'Aleman. The emperor had very well equipped the castle of Tyre, and he gave it to the lord of Sidon to command and made it appear that he trusted much in him; but King Henry of Cyprus he took with him.[62]

This story as told here is full of irony and contradictions, so much so that one wonders whether it can all be valid. Although Philip de Novare gives this detailed version, neither the Eracles texts nor the *Chronique d'Ernoul* include it, mentioning only that the emperor sailed to the West.[63] If the emperor had made such secret arrangements for his departure, is it likely or possible that so many people, both high nobles and common people, would know about it anyway, or that such a large crowd could have assembled on the spur of the moment early in the morning? If John of Beirut and Odo of Montbéliard really knew about this, or even were accompanying Frederick II as his official escorts, why did they not protect the emperor from this indignity, instead of making a show of stopping it only after it had begun? How odd that the emperor would respond to their wish of a good trip with word that he had named Balian of Sidon and Garnier l'Aleman as *baillis*, except to underscore apparently with irony that they, his supporters, were not there to see him off, leaving unsaid but indicating by implication that they awaited him in Tyre, where he obviously expected better treatment.[64]

As Jonathan Riley-Smith has written, "the first part of Frederick's stay in Palestine had ended in triumph with an imperial crown-wearing in the Church of the Holy Sepulcher, but the second, although it was marked by his seizure of power in Cyprus, could scarcely have been more humiliating for him."[65] Although he had the intention of leaving his trusted lieutenant, Thomas of Acerra, as his *bailli*, events had forced him to reconsider and name two local barons, investing one of them, Balian of Sidon, with the city of Tyre, a bastion he wished to hold in the Latin Kingdom. Riley-Smith furthermore identified four main consequences of Frederick's brief but tumultuous sojourn in the East:

1. His involvement with Egypt through the Treaty of Jaffa placed him at possible odds with the needs of the Latin Kingdom for peace with Damascus to ensure stability for the economies of the seignurial holdings among the barons.
2. His poor treatment by the people of the Latin Kingdom made him ever more determined to impose his will on them. The barons had relied on their interpretation of the *Assise de la ligèce* to resist Frederick's attempt to infringe on their rights, but the emperor was resisted at a time of weakness, a situation that would change.
3. His arrangements in Cyprus left the island on the verge of civil war.
4. The situation in Cyprus inevitably spilled over into the Latin Kingdom and poisoned dealings with his vassals there.

Unhappily one of Frederick's most lasting legacies to the Holy Land was indeed a civil war, in effect the transfer and implantation of the Guelf–Ghibelline conflict raging in Italy to the Frankish East, primarily in Cyprus and the Latin Kingdom.

In regard to Cyprus, the emperor's final deed en route to the West was to see the marriage of King Henry I to Alice of Montferrat, daughter of the marquis, who was one of his strong supporters in Italy. However, Frederick was leaving the Crusader East with John of Ibelin essentially unchallenged after their confrontation in 1228. Not surprisingly, the Ibelins staunchly refused to recognize the authority of the five *baillis* that Frederick had appointed on Cyprus. The result was that John of Ibelin led an army from Beirut to Cyprus and fought a victorious battle against Imperial forces at Nicosia on 14 July 1229. The five *baillis* and their backers retreated to fortified havens in the castles of Kyrenia, Kantara, and St. Hilarion (Dieu d'Amour). Peace was finally reestablished in 1230 when the *baillis* surrendered, leaving the Ibelins and their supporters in control.[66] The opening battle of the civil war had been quickly won by the Ibelin party, but the war had only begun.

It is difficult to assess the achievements of Frederick II in the Frankish East because he did so much that was damaging to the Latin Kingdom and to the two Crusades with which he was involved. However, even though he plunged the kingdom of Cyprus and the Latin Kingdom into a long civil war on his departure, the War of the Lombards,[67] the fact remains he was the only Crusader after 1187, when Saladin captured Jerusalem, to regain the Holy City. None of his famous predecessors had achieved that, neither Philippe II Auguste nor Richard I "The Lionheart." What is interesting, however, is that despite his famous Treaty of Jaffa in 1229 by which Jerusalem and the other holy places were returned to Christian hands, Frederick's reputation was largely a negative one in the mid-thirteenth century, outside of imperial circles. This is illustrated by the author of the Rothelin Continuation, who, writing in the 1260s in the region of Soissons in France, had the following to say about the Holy Roman Emperor and the Holy Land:

> In these holy places . . . the Saracens had turned the holy Temple of Our Lord into one of their Mahommeries and so it remained under the treaty Frederick made with the Sultan, ... Frederick did not rebuild the churches of the holy places, nor did he strengthen the holy city. Such was his fondness for the unbelievers, so close his intimacy and friendship with them, that he did them more honour and took more pleasure in their company and their affairs than in those of any other people. He employed infidel Muslims as his chamberlains and confidential servants, used those who had been

> castrated to guard his women, and in many ways followed Saracen customs and manners. Whenever he received envoys from unbelievers, he would greet them so kindly and with such delight that all were astonished, and would give them handsome and expensive gifts. He often sent splendid and costly presents to the sultan, and the sultan behaved in just the same way to him and his envoys. For this reason the pope and all Christians who knew of this were very much afraid he had fallen into the unbelief of Muhammed's law. Others however, maintained that he had not yet decided which faith to destroy and which to keep as the best. He also said, they alleged, that Moses had fooled the Jews, Jesus Christ the Christians and Muhammed the Saracens.[68]

This is a remarkable bit of testimony about how Frederick II was regarded in Europe in the second half of the century, after he died in 1250. Furthermore it appears in the Continuation under a chapter heading entitled, "De la mauveistié Fedric l'empereeur d'Alemaingne," that is, "on the wickedness of Frederick." From the content of the chapter he is faulted not only for what he failed to do in the Holy Land, but also for his favoritism of the Muslims and his questionable religious beliefs. What this testimony may reflect more than anything else by the 1260s, however, is how effective adverse papal propaganda had been in the meantime.

One aspect of Frederick's visit to the Holy Land that remains something of a mystery is the extent of his interest in the art that he would have seen during his time in the Latin Kingdom, whether Crusader, Eastern Christian, or Muslim. He is known to have exchanged lavish gifts with al-Kamil in the process of his diplomatic negotiations leading to the Treaty of Jaffa in 1229, but we are not told about the works of art among these gifts in any detail, nor do we know which of them he took home with him when he sailed to the West. Frederick is known to have been a patron of the arts in the kingdom of Sicily, but his art patronage in the Latin Kingdom is basically unidentified. Despite the close association of the Teutonic Order with Frederick throughout his adventures in the Latin Kingdom, he is not personally linked with any of their various projects during his sojourn in the East. It is unknown whether he commissioned works of art using prominent men in their ranks as his agents. We do not even know for sure whether he supplied the crown that he wore at the Church of the Holy Sepulchre in 1229, although it is likely. The only illustrated manuscript once proposed to have been ordered by him in the Crusader Kingdom now appears to have been commissioned for his second wife, Isabel, in 1225, not his third wife of the same name approximately ten years later, but no direct role of his can be documented in this project even at the earlier time.[69] Other Crusaders are said to have brought back objects from the East after this Crusade of 1228–9, as with all Crusades, for example, Peter des Roches, bishop of Winchester, and William Brewer, the bishop of Exeter,[70] but we have little information on what visual arts Frederick interested himself in, as a patron or otherwise, while he was a Crusader in the East.[71] We have no evidence that he brought back any major works of art to Italy when he left the Holy Land in 1229. For the time being we must perhaps conclude that in the arts – as well as in religion and in politics – Frederick II's views and interests were highly individual, often enigmatic, and frequently both brilliantly innovative and boldly unpredictable, but difficult to document.

After his arrival back in Italy in June 1229, Frederick was able to assemble an army rapidly and by the end of the year he had managed to repulse the invasion by the papal army and take full possession of his kingdom. As a result, John of Brienne was forced to flee to Champagne for refuge, a fact even noted in the Paris Eracles.[72] Under the terms of negotiations between Frederick and the pope, worked out laboriously over many months, from San Germano to Ceprano in July 1230, the heavy ban of excommunication was finally lifted. Moreover the emperor yielded significant concessions over the Sicilian clergy – rights to temporal jurisdiction, taxation, elections, and ecclesiastical property – and he returned property confiscated from the Templars and Hospitallers taken in Sicily in retaliation for their opposition to him in the East.[73] So successful was Frederick II in reestablishing himself at home, that in September 1230 he visited Pope Gregory IX at Anagni where "this great priest and this mightiest of emperors feasted together for three days in the palace of the Supreme Pontiff."[74] His reconciliation with the pope was thereby accomplished; no longer would he be harassed to take the Cross and fulfill his vow. Now his claim to be king of Jerusalem would be valid in the eyes of the pope, no matter how it was regarded by the Crusader nobility. Following the San Germano–Ceprano agreement, the pope ordered Gerold, the patriarch of Jerusalem, to remove the interdict against the Holy City and to accept the provisions of the Treaty of Jaffa between Frederick and al-Kamil in 1229. Now Frederick II was able to enter into the affairs of the Latin Kingdom and the kingdom of Cyprus and play a major role from a position of considerable power, albeit from afar.

CIVIL WAR IN THE CRUSADER STATES AND THE CRUSADES OF THIBAUT OF CHAMPAGNE AND RICHARD OF CORNWALL: 1229–1244

The Rothelin Continuation turns directly from its indictment of the "wickedness of Frederick" in regard to the Treaty of 1229 to the next Crusade in 1239. "The pope realised that Frederick was not going to put forward any plan for freeing the Holy Land from unbelievers. He sent to France, England and other parts of Christendom, ordering the clergy to preach the cross beyond the sea, and renewing all the pardons, indulgences and remissions which his predecessors had granted to crusaders."[75] Seen from the European West, this sequence may have reflected the main events with regard to the Crusaders in the Holy Land, but looked at from the viewpoint of the Latin Kingdom, the years 1229 to 1239, skipped over by the Rothelin Continuation author, are crucial to the understanding of significant new developments there. These include the civil war – what is also known as the Lombard War – the establishment of a commune in Acre, the assertion of baronial rights, the loss of the tradition of monarchical power in the kingdom, and the shrinkage of Crusader territory, including eventually the loss of Jerusalem, again.[76] This period is covered unevenly, but in some detail, by the Paris Eracles, although there is a curious hiatus for the years 1234–7.[77]

In the East, the results of Frederick's crusading legacy combined with the provisions of the Treaty of Jaffa in 1229 were beginning to surface, directly and indirectly. Basically the emperor's claim to the kingdom on behalf of Conrad deprived the kingdom of a resident leader because he would not send his son to the Holy Land with a designated regent. In the absence of the king, the kingdom was split between the imperialists and the pro-Ibelin supporters. Therefore there was no person in a position of clear authority who could take advantage of the terms of the Treaty of Jaffa. Even if a policy for the welfare of the kingdom based on the treaty could have been established, there was no one to enforce it. The Crusader lords attempted to protect their own territorial holdings, but the corridors to the holy places in the territory regained under the terms of the treaty went unprotected. The Paris Eracles tells the story of the first raid on Jerusalem by "Sarrasins" in 1229 after the treaty was in force.[78] The raiders were expelled on this occasion by the tiny imperial garrison with the help of reinforcements from Acre, but there is no evidence that the Crusaders made any attempt to refortify the city, nor were they apparently able to protect the pilgrimage routes up to the holy places very securely.[79]

Meanwhile the redoubtable John of Brienne reappeared in the Latin East, this time in the Latin Empire. As mentioned earlier, John had been commanding papal troops before he was forced to flee to Champagne in 1229. At that point, John's four-year-old daughter, Marie de Brienne, was offered the hand of the eleven-year-old Baldwin II, child emperor of Constantinople, if he, John, would consent to be regent. Remembering his brutal experience with Frederick II in 1225, John of Brienne carefully arranged to be given the title of emperor until his death, and consented to this new opportunity on those conditions.[80] John arrived in Constantinople by the summer of 1231, where he was crowned emperor, the marriage of Marie and Baldwin took place, and Baldwin II rendered homage to his new father-in-law as co-emperor. By any standard this last position was one of the finest chapters in his already remarkable career: the former king of Jerusalem, who had apparently once been mentioned as a candidate for the throne of England, became the Latin Emperor of Constantinople.[81] Despite the fact that Frederick II had become reconciled with Gregory IX by this time, what irony for him suddenly to find his former father-in-law, John of Brienne, in this unexpected capacity. The Holy Roman Emperor in the West cannot exactly have been pleased by this appointment of John of Brienne as the Latin Emperor in Constantinople.

A few months after his reconciliation with the pope, Frederick II intervened directly in the East. Following a papal letter to the Templars, demanding their submission to the imperial bailiff and to the terms of the Treaty of Jaffa, Frederick organized an expedition to be sent to the Latin Kingdom in the autumn of 1231 under his marshal, Richard Filangieri.[82] Although Frederick told the pope plausibly enough that he had to deploy an army for the defense of the Latin Kingdom, in fact his marshal, Filangieri, proceeded to attack the Ibelins on the basis of his explicit command. After landing at Limassol, he sent instructions from Frederick to the king of Cyprus to banish members of the Ibelin family from Cyprus and take over their lands. Finding the king of Cyprus unwilling to dissociate himself from the Ibelins, and John of Ibelin there with the king, Filangieri sailed to Beirut, took the city, which was surrendered by the resident bishop, and laid siege to the castle in the absence of its lord. Leaving his brother Lothair in charge of what turned out to be a long siege, he also occupied Sidon and Tyre and then went to Acre.[83]

When he arrived in Acre, Marshal Filangieri as imperial bailiff took the important step of assembling the nobles and the burgesses together in the great hall of the palace[84] where he presented letters sealed with gold,[85] "et venoient de par l'empereor Fedric a touz ceauz dou roiaume."[86] Once accepted as *bailli*, he attempted to proclaim the forfeiture of all Ibelin lands in the kingdom. The speech that Balian of Sidon is reported to have delivered[87] in response to this imperial initiative is described by Riley-Smith as "one of the most famous of all the barons' statements and in no other passage in the sources is their view of the relations between crown and vassal so well expressed."[88] It also reflects what Prawer calls "the incredibly legalistic minds of the Crusader nobility," especially from the imperial point of view.[89]

Riley-Smith summarizes the content of the speech as follows:

> Because of the circumstances of the conquest of Palestine by the First Crusade and the election of Godfrey of Bouillon as ruler the kings had a special relationship with their vassals; that among the laws they had sworn to obey was one forbidding them to dispossess their vassals without *esgart* of court; that John of Beirut was the emperor's man and that Richard Filangieri, who was Frederick's lieutenant with the duty of guarding the land and maintaining the rightful heir – evidence that he had been accepted as *bailli* – had dispossessed John of the city and fief of Beirut and was besieging his castle without previously having sought *esgart* or *jugement*; that in consequence Balian, on behalf of the vassals, required Richard to withdraw from Beirut so that John could be put back in seizin of it, because no action could be taken unless John were summoned to trial in the High Court according to the usages of the Kingdom of Jerusalem; and that if by the *esgart* of the court John was found to be guilty of wrongful possession of the fief, Balian committed the vassals to help Richard to dispossess him.[90]

Richard Filangieri said he would consult with his men, but when he returned to Beirut, he pressed the siege of the city ever more vigorously. Emissaries sent from Acre to learn of his decision were told that he was the emperor's man and was bound to follow his orders. If the Crusader nobles could not accept his actions, they should apply directly to the emperor themselves.[91]

Once again, the high-handed tactics of the emperor failed in the face of the laws of the Latin Kingdom and the rights of the Crusader lords. In fact, this second imperial effort to break the power of the Ibelins only had the result of solidifying baronial support for John of Ibelin. The imperial attempt to have what was in effect a provisional government run by appointees from among the local barons with Marshal Filangieri in supreme command only succeeded in generating a "climate of permanent resentment and rebellion."[92]

As a stellar demonstration of their opposing views, the citizens of Acre, merchants together with a number of nobles in the city, organized an independent commune in the city of Acre. This was not the first commune in the Crusader East; others had appeared, briefly in Tyre, and there was a long-standing commune at Antioch.[93] The commune at Acre was organized on the basis of a confraternity to which most of the members belonged.[94] This confraternity of St. Andrew was unusual among typical examples in the Latin Kingdom at this time, because it was open to all freemen willing to take an oath binding themselves to uphold the rights of the group. The confraternity had its own seal,[95] so it seems certain that the commune would have had its own seal as well. The commune was known to have its own bell, to call its members together, which was apparently hung in the campanile of the Cathedral of the Holy Cross.[96] It had its own officers and John of Ibelin was invited to become their first mayor.[97] In April 1232, when John was reasonably certain that the city of Beirut could hold out against Filangieri, he came to Acre and solemnly took office. The commune thus began in 1232 and existed until 1243, although its last official act occurred in 1241.[98]

As the result of these developments, the battle lines in the Latin Kingdom between the imperial forces and the Ibelin supporters were drawn more clearly than before as hostilities expanded to several locations. The main problem was that central political – and, to some extent, ecclesiastical – authority in the Latin Kingdom did not exist for the next twelve years, because of what amounted to civil war.[99] There continued to be no resident king, and in fact the patriarch of Jerusalem was also absent for four years, between 1233 and 1237, called to Rome by the pope because of his alleged opposition to Frederick II.[100] In fact when Gerold returned to the Latin Kingdom in 1237, two important prelates had also recently died and replacements were desperately needed.[101] Lacking a king in this situation, the Latin Kingdom was split between the imperial forces and the Ibelin party. The imperialists consisted of the marshall, Richard Filangieri, with his two brothers and their troops, staunchly supported by the Teutonic Knights led by Hermann of Salza, a few Crusader nobles, and the Pisans. The Hospitallers overall also maintained a pro-imperialist stance. The Ibelins were supported by most of the Crusader nobility, a total of forty-three major lords, the commune of Acre, the Genoese, and King Henry I of Cyprus. A third important group attempted to position themselves between the warring factions, but eventually they were forced to side with the Ibelins. They included the Templars, the Venetians, and certain nobles such as Balian of Sidon and Odo of Montbéliard, along with many of the clergy.[102]

As bases of operation, the imperialists held Tyre and Sidon, the Ibelins controlled Acre, Beirut – which was, however, currently under attack – and Cyprus. John of Ibelin had sent his son, Balian, to seek help through an alliance with Tripoli.[103] Jerusalem remained unfortified, but there was a small garrison of imperial troops. Gerold the patriarch pointedly refrained from taking up residence there between 1231 and 1233, even after the interdict on the city had been lifted, and then again after his return from Rome in 1237. Instead he appointed the dean of Jaffa and the abbot of the Mount of Olives monastery as his vicars there.[104] Gerold remained fundamentally opposed in principle to the Treaty of 1229, Jerusalem's walls were dismantled and he could not in any case afford to undertake the refortification of the Holy City on his own, and he would not countenance the idea that Jerusalem was to be shared with the Muslims. In contrast to Gerold's decision to maintain his residence in Acre, the bishop of Bethlehem and the archbishop of Nazareth apparently did return to their cathedrals while the treaty was in force.[105] However, as Hamilton points out, "their custodianship was half-hearted."[106]

Hostilities continued through the latter part of 1232. At Acre, the commune led by John of Ibelin seized thirteen ships of the imperial fleet in the harbor there. At Beirut, the Ibelins held on firmly to the castle in the face of the imperialist siege. The Ibelins planned a counterattack by mounting a foray against Tyre. When Filangieri learned of this attack, he ordered the siege of Beirut lifted and his troops to return to Tyre for its defense. Beirut had been heavily damaged by the siege, but the castle had never been taken. As Cypriot troops under King Henry began marching north from Acre to join the Ibelin forces from Beirut, the Imperial troops surprised them in camp at Casal Imbert, almost due west of Montfort on the coast, only 15 kilometers north of Acre.[107] Imperial troops from Tyre supported by ships along the coast inflicted a serious defeat on Henry and his men, on 3 May 1232. The Ibelin supporters lost substantial numbers of horses and arms, and much equipment, which Filangieri used to supply his army. Complete disaster was averted only when John of Ibelin, who had been in Acre discussing proposals for mediation put forth by Filangieri in the person of the patriarch of Antioch, was able to march quickly to aid Henry and his army and save his sons.[108]

From the mainland, the field of battle then moved to Cyprus, which the Ibelins had left undefended during their recent activities in the Latin Kingdom. Filangieri having returned to Tyre with considerable booty, saw the opportunity to seize all of Cyprus in the king's absence, by sending his army to the island under the imperial *bailli*, Amaury Barlais. He sailed immediately and made an easy conquest in May before the Ibelins could regroup. After they had found new recruits for their army and raised money to pay for the campaign, the Ibelins sailed to Famagusta, arriving a month later on 6 June 1232. With a surprise attack at night, the Ibelins captured Famagusta, forcing Filangieri to fall back to Nicosia. The Ibelins followed, slowed by lack of food caused by the scorched-earth policy of the imperial army, which burned all the newly harvested grain as they retreated. Filangieri decided not to try to hold Nicosia, and evacuated the city to take up a position guarding the main pass north to Kyrenia. The Ibelins on entering the capital city found food stores inadvertently overlooked during the hasty departure of the imperial troops, enabling them to press their pursuit. On 15 June the two armies met at Agridi, just south of the pass, where the outnumbered Ibelins managed to defeat the imperial troops through superior discipline in the ranks.[109] Edbury describes this battle as fought by much larger numbers than Nicosia in 1229, or Casal Imbert earlier in 1232; it was "probably the biggest clash of arms between Christians in the Latin East at any time in the twelfth or thirteenth centuries."[110]

Despite Philip of Novare's polemics against the imperial party, Filangieri's policy on Cyprus in 1232 is puzzling. The "Lombard" or "Longobard" army, meaning imperial troops from southern Italy, apparently deliberately treated the people in a brutal way, in effect taking hostages and forcing women and children to hide out of fear, while wreaking destruction in their path.

> The Longobards came hastily to Nicosia and there they committed all the abominations and outrages and villainies of which they knew and were capable. They broke into the churches and the Temple and the house of the Hospital and all the religious houses, and they dragged out the ladies and the children who clung to the altars and to the priests who chanted the Masses. Wherefore it happened that in one place they scattered from the hand of the priest the body of Our Lord and threw the Sacrament on the ground. They

> put the ladies and children into carts and on donkeys most shamefully and sent them to Cerines [Kyrenia] to prison, and they pricked with goads those who refused to go at once.[111]

Later in this campaign,

> The host of the Longobards, when it left Famagusta, fired the granges and the entire plain and this caused great damage, for most of the grain was already in the granges. They broke all the mills of La Quetrie [Kythria near Nicosia], even the hand mills they broke at Nicosia in so far as they were able.[112]

Clearly the imperialists were attempting to capture the families of their Ibelin opponents, to deny supplies to the Ibelin army, and apparently to punish the secular Latin church for supporting the Ibelins. However, their campaign seems particularly heavy-handed. We do not know, of course, whether, when Ibelin forces were looking for imperialist sympathizers, they also broke into the churches, but it is less likely they would have engaged in tactics that might do damage to their own people. Edbury cautions us about Philip of Novare's exaggerations, but even he admits it is difficult to know how much allowance to make. Certainly Philip of Novare does conveniently omit the most egregious wrong done to Greek Orthodox monks during the civil war by Latin clergy, the infamous martyrdom of thirteen monks from Kantariotissa in 1231,[113] but it must be said that this outrageous act had nothing obviously or directly to do with the combatants in the Lombard War. Nonetheless, the imperialist policies certainly did create fear among the people and serious financial strains on the king, and it further embittered the Latin population against the imperialist party, ultimately contributing to its downfall.[114]

Immediately following the Ibelin victory at Agridi, the Castle of St. Hilarion guarding the pass was relieved and its Ibelin defenders liberated, while the main army moved on to attack Kyrenia. Here the siege lasted nearly ten months. The Ibelins sought the aid of a fleet to blockade the port, and finally induced the Genoese to help. The imperialists sought assistance from Armenia and Tyre, without success. The castle of Kyrenia was well defended; many noble Ibelin soldiers were killed or seriously wounded in the attack. The most celebrated victim during this siege was, however, Queen Alice of Montferrat, the woman Frederick II had caused King Henry to marry before he left Cyprus in 1229. Philip of Novara tells the story:

> The wife of the king was within, who was called the Longobard queen because the emperor had given her and she held to the party of the Longobards. She died within. When she was dead those of Cerines [Kyrenia] carried her outside, and it was said that she was the queen and that she was dead. The king and the lord of Beirut received her and made great mourning for her death and had her carried honorably to Nicosia by the hands of knights all on foot. They then ordered a procession and all the people of Nicosia to accompany her within as far as the cathedral church of Nicosia where she was buried.[115]

She had married King Henry by proxy and Runciman observes that it is doubtful she and her husband had ever seen each other alive. No doubt it was a melancholy experience for Henry to oversee the somber march to Nicosia and the obsequies in the Cathedral of Haghia Sophia in Nicosia, presided over by Archbishop Eustorgue for his dead bride.[116]

The siege finally ended in April 1233 when the imperial commander, Philip Chenard, surrendered on honorable terms: the Ibelins allowed the garrison to leave for Tyre, and a prisoner exchange was organized. With the capture of Kyrenia, the civil war on Cyprus was over. In a dramatic *volte face*, the Ibelins, whose leader, John of Ibelin, had been forced out of Cyprus by Frederick in 1228, were now victorious. Their ally, King Henry I had now come of age in 1232, eliminating the need for Frederick II's intervention as suzerain in the affairs of the kingdom of Cyprus. Steps were taken to minimize the presence of imperial power. The *baillis* who had been appointed by Frederick and who had fought against the king were relieved of their fiefs and expelled from Cyprus, including Amaury Barlais and Philip Chenard. Chenard returned to the West to serve the emperor with distinction in Italy into the 1250s. Barlais and a number of other disinherited Cypriots fled to Tripoli, but unlike Chenard, he died shortly thereafter, in 1236.[117] Edbury points out that in most cases, the families of the defeated on Cyprus were disinherited, whether they left the island or not.[118]

If the Ibelins had won on Cyprus, however, the situation was far from resolved in the Latin Kingdom and elsewhere on the mainland. In March 1233, Bohemond IV died in Tripoli, and Tripoli and Antioch passed to his son, Bohemond V. Bohemond IV had proved to be an able ruler and a good legal scholar, who had maneuvered independently – first siding with the emperor, later with the Ibelins – and on the whole successfully, during the difficult days of the civil war. Despite Bohemond IV's changing stance vis-à-vis the Ibelins and the emperor, his problematic dealings with the Hospitallers and the Templars, and his troubles with the pope, Tripoli was in 1233 prosperous somewhat in contrast to Antioch, which was comparatively impoverished and isolated. Under his son, Bohemond V, the situation only worsened in the north: commerce continued to fall off, he was not popular with the commune of Antioch, which governed the city, the two major military orders mostly operated independently of his control, the Armenian kingdom in Cilicia was basically unfriendly, and the Muslim enclave of Lattakia cut the principality of Antioch off from the County of Tripoli to the south. By 1244 these ongoing problems were exacerbated by the great military disaster of La Forbie in which the knights of Tripoli and Antioch were heavily involved.[119]

In regard to the Latin Kingdom itself, when Frederick II heard what had happened to the imperial forces on Cyprus at the battle of Agridi and while the siege of Kyrenia was still in progress, he sent letters by the hand of the bishop of Sidon,[120] who had been in Rome at that time, presumably late 1232 or early 1233. Frederick proposed to restrict his *bailli*, Richard Filangieri, only to Tyre, because of his failure in carrying out the emperor's policies in the Latin Kingdom and on Cyprus. He further proposed to appoint Philip of Maugastel as his *bailli* to Acre, apparently as a gesture to the local barons. This proposition was initially accepted by Balian of Sidon and Odo of Montbéliard, who had been appointed *bailli* and constable, respectively, by Frederick before he sailed home in 1229, and then joint *baillis* in Acre in 1231.[121] However, when a meeting of the nobles of the high court was convened early in 1233 in the Cathedral of the Holy Cross for the barons to take their oaths to the newly proposed bailiff, John of Caesarea, nephew of John of Ibelin, who was currently at Kyrenia, vigorously opposed this action. John of Caesarea declared – on dubious grounds – that such a proceeding was illegal because the king of Jerusalem – or presumably the emperor as regent – needed to appear in person before the court to effect such a change. When a dispute arose over this issue, he caused the commune's emergency bell to be rung so that its members rushed into the church, illegally disrupting this meeting. The bishop of Sidon, Balian of Sidon, and Odo of Montbéliard were forced to flee to the residence of the bishop of Acre, where John of Caesarea was able to protect them. Philip of Maugastel fled to Tyre.[122]

This is a strange story in many ways, but the result of this incident was that Philip of Maugastel was repudiated as the imperial bailiff of Acre, Balian of Sidon and Odo of Montbéliard were reaffirmed in their lawfully appointed positions, and when John of Ibelin returned to Acre from Kyrenia, he was voted to be the mayor of the commune of Acre for a second year. The fact is, that if Frederick II was attempting to curry favor with the barons by his choice of Philip of Maugastel, he was ill-advised. Local barons no doubt knew that Philip was Richard Filangieri's lover – as Philip de Novare bluntly pointed out[123] – and having him as *bailli* in Acre with Filangieri in Tyre would change little in the eyes of the anti-imperialist/pro-Ibelin barons.

Philip de Novare follows this episode with another strange story, that of the meeting of John of Ibelin with the bishop of Sidon. When the bishop attempted to induce John of Ibelin to reconcile himself with Frederick II and to place himself at the mercy of the emperor as his lord, John is reported to tell the bishop the story of the lion and the stag, "a story which is written in the book of the fables of Renard." Once upon a time an old lion was told that he needed fresh food or he would die. The lion in a ruse invited a handsome stag to his cave, but when the stag entered the cave, the sickly melancholy lion attempted to capture and eat the stag, who was young and strong. The stag escaped with his head badly wounded, but he soon recovered. Much time passed, the lion apologized and excused his unseemly action, while inviting the stag once again to come and visit him. This time the lion came out to meet the stag, and again he tried to attack the stag, grabbing him with his claws and wounding him seriously on his back. Again the stag escaped. The third time, the lion sent his companions to persuade the stag to return, and when he did they set upon him and killed him. The lion then gave the stag to Renard to prepare it, and Renard ate the heart. When the lion came to eat, there was no heart. When he was accused of eating it, Renard denied it saying, "the stag came once to court and went away with a bloody head; another time it came back and left with two gouges in its back; the third time it came to die as meekly as those who have no heart, for if it had a heart it would not have come back the third time; and a proverb says, 'That which is not cannot be found.'"[124]

John of Ibelin likened the emperor to the lion and himself to the stag, saying that two times the emperor had deceived him. If, he said, he placed himself for a third time at his mercy, he would surely be slain and judged to have no heart. "Wherefore I say to you, Sir Bishop, and I wish that he should know well, that he will never have me in his power."[125]

Following the tumultuous events in Acre over the *bailliage*, the pope himself made an attempt, on behalf of Frederick II, to restore the emperor's authority in the Crusader East.[126] Eventually, in August 1234 he sent the archbishop of Ravenna as a papal legate to the Latin Kingdom, in an effort to enforce compliance with the arrangements previously proposed. When the archbishop had no success, he briefly excommunicated the emperor's leading opponents, and placed the city of Acre under an interdict. By September 1235 these harsh measures were, however, rescinded and a second attempt was made by sending two knights, Henry of Nazareth and Philip of Troyes, with the terms of a new settlement.[127] When these envoys arrived in Acre in the spring of 1236, the proposal foundered on two key issues: first, the pardon for John of Ibelin and his immediate relatives was not universal, and therefore not adequate, and second, the people of Acre were unwilling to dissolve their commune.[128] In response to the pope's proposed settlement, the barons sent another envoy, Geoffrey Le Tor, to Rome to explain their position to Gregory IX.

The Paris Eracles makes a big point of stressing the fact that Geoffrey Le Tor was a Cypriot knight born in Syria, who represented the views of both the king of Cyprus and the people of the Latin Kingdom. He sails in a Genoese ship bearing "beaus presens et riches" for the pope and the cardinals, whom he finds in Viterbo. When Geoffrey made his points about why the proposed settlement terms were unacceptable and, no doubt, about the fact that some months before Jean d'Ibelin and Walter of Brienne had led a Crusader army of knights and soldiers from Cyprus, the kingdom of Jerusalem and the County of Tripoli, from the castle of Crac des Chevaliers against the Muslims of Hama – an expedition in which imperial troops were conspicuously lacking – the pope received him well. The pope reportedly accepted his explanation, and promised the aid of the church for the king of Cyprus and the kingdom of Jerusalem. He is also said to have urged the military orders and the Italian maritime powers to aid them as well.[129]

It was at this point, in late February or early March 1236,[130] that John of Ibelin died of wounds suffered in a chevauchée when his horse fell on him. Whereas the Paris Eracles very curiously fails even to mention his passing,[131] Philip de Novare gives a moving account of his final days:

> In this year [1236] my lord John of Ibelin, the good lord of Beirut, who was well mindful of the great privileges and honours that Our Lord had done him, was mortally wounded when he was crushed in a riding accident.[132] He made his will in so orderly a fashion that everyone was amazed at his prodigious memory. He put right the wrongs he had done including many things that lesser men would not have regarded as wrongs, and he paid his debts, for he had at that time many possessions and much property, not to mention his fiefs. He gave away everything by his own hand for the sake of God and the salvation of his soul as a lasting memorial. He gave many fiefs to his children and ordered that they should hold them of their eldest brother and be his vassals. After that he became a brother of the Temple, just as he had vowed. His children put up much opposition, and all the people of the land were very sad because of it, but it made no difference. Despite their wishes and totally of his own volition he entered the Temple and had himself brought to Acre. He did not live long as a brother of the Order. He made a very good end at this death, and, so that the truth of it may be wondered at, it shall be told in full. When he had to yield up his soul, he asked that a crucifix be brought. Philip of Novara brought it before him, and he took it in his hands and kissed the feet of Our Lord Jesus Christ and said as best he could, "In manus tuas, Domine, commendo spiritum meum." And so he rendered up his soul to God. His body remained unchanged at death, and, if it is to be believed that the good soul goes into the presence of God, then we may be certain that his soul has gone there in Paradise. Now his son, my lord Balian, remains lord of Beirut

> in his place. He conducts himself well and vigorously, and he has fine brothers and cousins and good friends who give him the best of support.[133]

John of Ibelin, known among his contemporaries as "The Old Lord of Beirut," had been a dominant figure in the Frankish East. John La Monte comments:

> although the sphere of his influence may be said to have been limited to a small and unimportant state, it was something to have so lived that his contemporaries and successors looked up to him as the model of knightly chivalry, the true Christian knight, "sans peur et sans reproche." In an age of broken oaths and bad faith, of violence and force, John d'Ibelin stands out as an honest and honorable Christian "preudhom," worthy to rank with Saladin and St Louis as an examplar of chivalry.[134]

Edbury reminds us, however, that an important part of what we know about Jean d'Ibelin we know from the hands of his publicist, Philip de Novare. John of Ibelin may have been a noble character striving for right, honor, and chivalry – he was described by Wilbrand of Oldenburg in 1212 as "an exceedingly Christian and energetic man" – but behind it all he was also clearly a shrewd and able politician and warrior who knew how to play the high stakes game of power politics. "John of Ibelin's chief claim to fame lies in the fact that he successfully defied the might of the western empire and emerged from the struggle strengthened as a result."[135]

The fact that the death of John of Ibelin is not even mentioned in the Paris Eracles is an indication of the scarcity of information about the middle years of the 1230s in the Latin Kingdom for the anonymous author of this chronicle. In fact, there is another important Crusader who dies in 1236 who is also unrecorded in the Paris Eracles. Philip d'Aubigny was a prominent knight, a former tutor and councillor of King Henry III, whose father, Ralph, had died in the East on the Third Crusade.[136] Philip d'Aubigny was already important enough in 1215 to be mentioned in the preamble to *Magna Carta*.[137] Philip himself arrived in the East, at Damietta, on 5 September 1221 just as the Fifth Crusade was ending. In 1228 he took the Cross again and sailed for Jerusalem in 1235. Although he died in Jerusalem in 1236, he had the good fortune of being buried just in front of the south transept portal of the Church of the Holy Sepulcher.[138]

His tomb slab, which bears his coat of arms and an inscription in beautifully carved Gothic letters, can still be seen there today, under a protective wooden covering (Fig. 83). The simple inscription reads:

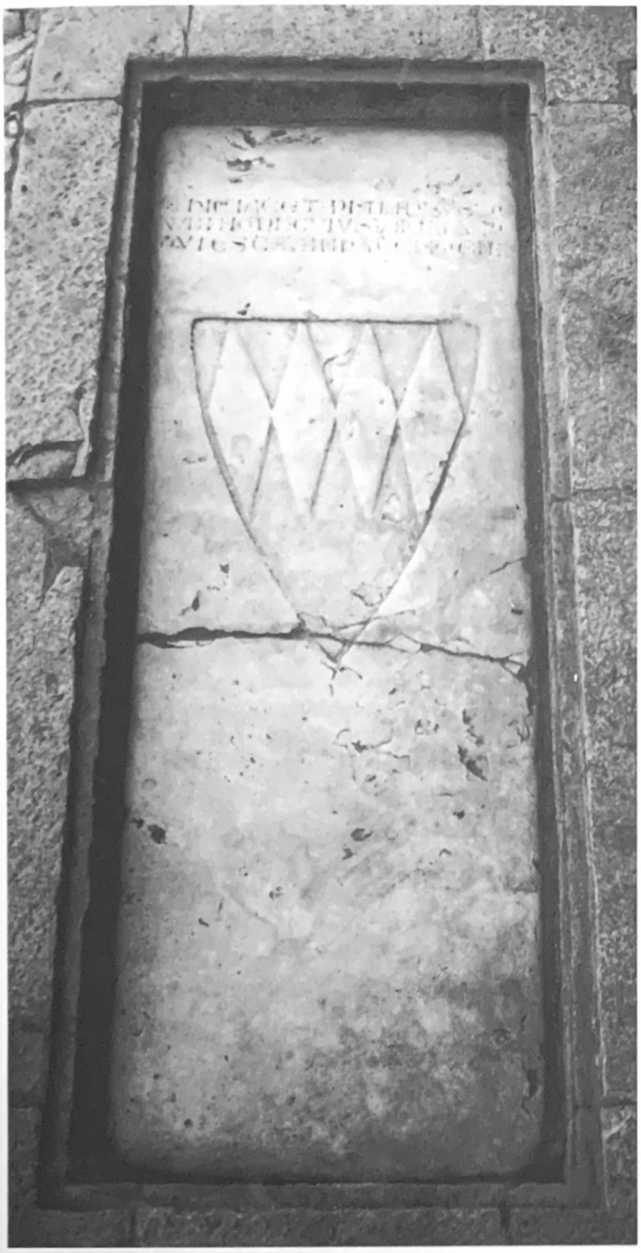
> + hic iacet Philippus de Aubingni cuius anima requiescat in pace Amen.[139]

One imagines how and why his tomb was placed here in this particularly auspicious location.[140] One wonders how he arranged for a burial in this place, when Jerusalem was accessible to Christian pilgrims under the special provisions of the Treaty of 1229, between 1229 and 1239, but where so few Crusader burials are known and so little artistic activity was apparently undertaken here during this period. However modest it is, the elegant simplicity of the tomb plaque of Philip d'Aubigny seems to demonstrate that Crusader artistic work was carried out in Jerusalem at this time.[141] Indeed Philip d'Aubigny achieved something here – the grace of a Christian burial at the very doorstep of the sepulcher of the Lord – quite different from John of Ibelin, who was buried as a Templar.[142] Nevertheless, the two of them are examples of personal characteristics of many Crusaders that are sometimes lost in the modern study of medieval history. Just as John of Ibelin represents a stellar example of the best Crusader chivalry had to offer, Philip d'Aubigny reflects the genuine idealism and true religious fervor associated with the Crusades, even in these troubled times when a certain cynical medieval "realpolitik" was practiced by many Crusade leaders, laymen, and clergy alike.

In the wake of John of Ibelin's death, the lords of the Latin Kingdom were left without a dominant ruling personality. An uneasy truce was observed between Filangieri, who continued as *bailli* at Tyre, and Odo of Montbéliard and the somewhat discredited Balian of Sidon, who retained their appointments as co-*baillis* at Acre with the support of the High Court and the commune. Fortunately the numerous members of the extended Ibelin family occupied important positions in the kingdom and they were able to work together harmoniously. These family members included a number of figures who would play major roles in the history of the kingdom, the most famous of whom is John of Ibelin's nephew, also named John. This John later became the count of Jaffa and, as the premier Crusader lawyer, wrote the *Livre des Assises de Jerusalem*.[143] In the meantime Emperor Frederick II was too busy with his own affairs in the West to pay much attention to the Latin Kingdom at this point, and the Ayyubids continued to fight among themselves.[144] Indeed, by 1238, both al-Ashraf and al-Kamil had died, and the latter's death especially had loosed civil war on Muslim lands from Cairo to Aleppo.[145]

In the fall of 1236 and the spring of 1237 a new Crusader army was forming in the West in anticipation of the expiration of the truce concluded by Frederick II and al-Kamil. In fact, the situation was complicated because Pope Gregory had issued a call for an expedition to go to Constantinople to aid Baldwin II,[146] and a separate call for an army to go to Palestine. Not only that, but when the Crusaders sought to arrange for their departure to the Holy Land, Frederick II initially refused all aid, because he did not want the truce broken in Syria-Palestine until it expired in August 1239. His refusal to cooperate effectively blocked their departure since the Crusaders needed passage through lands in his control, in order to access shipping and supplies. Gregory dealt with the situation by rescheduling the departure for Constantinople to August 1238, and to the Latin Kingdom to August 1239.[147]

Participants in the expedition to Constantinople gradually diminished to the point where only two important nobles finally set out in the late summer or early fall of 1239, Humbert of Beaujeu and Thomas of Marly. As for the Crusade to Palestine, an impressive number of figures gathered in Lyon in July of 1239, including Thibaut IV of Navarre, Hugh IV of Burgundy, two important officers of the kingdom of France, and Peter of Dreux, a battle proven warrior who was probably the best soldier of this group.[148] In England there were prominent nobles who took the Cross as early as 1236 as well, including Richard, earl of Cornwall and brother of King Henry III; Gilbert Marshal, earl of Pembroke; and William Longsword, earl of Salisbury. These English Crusaders were also delayed,



83. Jerusalem, Church of the Holy Sepulcher: Tomb Plaque of Philippe d'Aubigny.

and they did not leave England until June 1240, well after the French contingent.[149]

Once again the figure of Frederick II cast a shadow over the Crusade. Despite what the Rothelin Continuation suggests, that Frederick had asked the Crusaders to delay their departure until he could join them, there was probably no expectation that Frederick would actually take the Cross again. Nonetheless, he was still the regent and guardian for Conrad, king of Jerusalem, and the Crusaders would need to pass through territory under his control to the usual Italian ports of embarkation for the Holy Land; therefore his cooperation was indeed essential. However, Frederick's status was again compromised. He sought to control Italy. The pope supported Frederick's enemies in northern Italy. Things came to a climax when, the papal and imperial "reconciliation" in 1230 having completely unravelled, on 20 March 1239, Gregory IX excommunicated Frederick II for a second time.[150]

The ban against Frederick persuaded most of the Crusaders to leave by ports not under imperial control. The Rothelin Continuation says simply, "they all assembled at Marseilles. Some, but not many, went through Lombardy into Apulia."[151] The French Crusaders set off on the August *passagium*, and despite a serious storm at sea, they arrived at Acre in September 1239. The new Crusaders were met by the great barons and major prelates of the Latin Kingdom. The barons included Odo of Montbéliard and Balian of Sidon, co-*baillis*, Balian of Beirut and John of Arsuf, two important members of the Ibelins, and Walter of Brienne, the new count of Jaffa. The clergy was led by the patriarch of Jerusalem, Gerold; the new archbishop of Tyre, Peter of Sargines; and the bishop of Acre, Ralph of Tournai.[152] A council of war was held to assess the situation and consider strategy. The truce of 1229 had expired in late August, and the Muslims had apparently already raided Jerusalem before the Crusaders had arrived in the Holy Land, exposing its vulnerability to attack.[153]

The first problem for the new Crusaders was to appoint a commander; it was at this point that Thibaut was apparently elected.[154] Secondly they needed to figure out who and where the enemy was, before military operations could proceed.[155] After the death of al-Kamil in 1238, his son, al-Adil II, had established himself as sultan in Cairo and attempted to assert his control over Damascus. Damascus, however, was newly in the hands of a nephew, al-Jawwad Yunus (Muzaffar-al-Din Yunus), who had allied himself with al-Salih Ayyub (al-Salih Najm-al-Din), al-Adil II's brother, in the Jazirah and exchanged rights to Damascus for Jazirah territory. Ayyub had designs on Damascus, but also had greater ambitions, namely to rule Cairo as well. In the spring of 1239, Ayyub's army was camped at Nablus awaiting new developments while conducting raids on the Crusaders. Meanwhile another nephew, al-Nasir Daud (al-Nasir Dawud), nominally controlled Kerak, his residence, and Nablus. Finally, Ayyub's uncle, al-Salih Ismail (al-Salih Ismail of Busra), who was al-Kamil's brother, was positioned in the Bekaa Valley, at Baalbek, where he was attempting to prepare himself for an attack on Damascus. Other, more distant relatives held Homs and Hama east of Crac des Chevaliers. As members of the Ayyubid family maneuvered to gain power, it was confusing for the Crusaders attempting to establish their objectives.[156]

During the council at Acre, the Crusaders observed important developments among the Ayyubids, which they responded to accordingly. Al-Salih Ismail successfully took Damascus in late September, and surprisingly a month later, Ayyub was "taken into custody" by al-Nasir Daud after he had been deserted by his troops and captured by some Bedouin. He was then taken to Kerak under arrest and put in prison there. Al-Maqrizi completes this extraordinary story of Ayyubid struggles for power by mentioning that in prison Ayyub was accompanied only by a Mamluk named Rukn-al-Din Baybars and a slave girl named Shajar al-Durr.[157] With the removal of Ayyub as a threat both to al-Adil II and to the Crusaders, al-Adil II could now move to strengthen his position in the south. As the result, the council at Acre decided at the start of November 1239 to march first to secure the Crusader positions at Ascalon and Gaza, in order to neutralize al-Adil II.[158] This strategy made good sense in light of the Ayyubid developments, and no doubt was supported by Walter of Brienne, count of Jaffa, because of the security it would offer his territory.[159] Following the first operation to the south, the plan was that the Crusaders would turn northeast and attack Damascus, in order to regain the territory lost to Saladin in 1187, liberating Jerusalem from threat of Muslim attack and securing the lands of the Latin Kingdom not returned under the treaty of 1229 arranged by Frederick II.

As the Crusaders marched southward, Peter of Brittany learned of a Muslim caravan en route to Damascus, which he attacked and captured after hard fighting.[160] His independent raid provided some useful provisions for the Crusaders, but unfortunately a number of other knights sought to emulate his success at the expense of discipline and the military integrity of the army. A second raiding party led by Henry of Bar le Duc with a surprising number of prominent knights[161] formed a detachment to attack what was reported to be a small Egyptian force at Gaza. Thibaut, the masters of the three military orders, and Peter of Brittany jointly tried unsuccessfully to deter the soldiers from this risky maneuver, and Thibaut as commander ordered them to stay with the main army. They rode off nonetheless toward Gaza, pointing up once again the serious chain of command problem seen so frequently in Crusader armies.

When Henry of Bar and his men arrived near Gaza on 13 November, the Egyptian army they encountered was much more powerful than they had realized. Furthermore, in an effort to rest his men after a long ride from Jaffa, Henry had unwittingly placed his troops in a vulnerable position. While the men and horses ate and rested at dawn in a sandy depression ringed by high dunes, the commander of the Muslim forces, Rukn al-Din, encircled the Crusaders and attacked. The battle was short, the Rothelin Continuation says simply, "They were all killed or taken."[162] The Paris Eracles says that Henry of Bar le Duc was killed and Amaury of Montfort was captured.[163]

Meanwhile, Thibaut and the main army had marched to Ascalon to camp, where they could support this errant detachment if need be. Before everyone was installed, however, word of the Crusader battle near Gaza reached them. The Teutonic Knights rushed to aid those Crusaders attempting to flee the ambush. They were able to help these men and some seriously wounded soldiers they found on the battlefield, but they could not save the prisoners the Muslims had taken. The main army could not pursue the Muslims for fear they would kill their prisoners. They had no choice but to retreat, back to Jaffa and eventually to Acre.

One of the prisoners, Philip of Nanteuil, who survived his captivity and was later released, wrote a lament that he sent to the Crusader army.

> In song I'll mourn
> to ease my grief
> for Montfort, noble count, who bore his fame so well. . . .
> Ah France, admired and loved,
> now all your joy is turned
> to endless tears. . . .
> Ah count of Bar, your loss
> strikes cruelly at France.
> When Frenchmen hear the news
> How they will grieve! . . .
> If the Hospitallers,
> Templars and brother knights
> had shown our men the way,
> had ridden as they should,
> then all our chivalry
> would not in prison lie,
> nor Saracens still live. . . .[164]

His message that the military orders were somehow to blame seems to represent the view of the French soldiers who rode off on the ill-fated raid, but it obviously simultaneously deflects blame from Thibaut, the French commander, who actually gave the order to Henry of Bar le Duc not to go.[165]

Shortly after this abortive Crusader expedition, an-Nasir Daud, Muslim emir of Kerak, saw his opportunity to attack Jerusalem with the Crusaders in disarray following their defeat near Gaza, and he led a more serious assault on the Holy City, on 7 December 1239.[166] The Rothelin Continuation says:

> The Christians had begun to fortify the city near the St Stephen gate, using the alms they received for this purpose, and had repaired a short stretch of the ramparts and a few turrets, but the moment the Saracens got there, they demolished all this and pulled it down. They laid siege to the tower of David and attacked its tiny garrison from every side. . . . Once the Saracens got possession of the tower of David, they immediately put their miners into it and had the whole fortress taken down and razed to the ground. The size of the enormous stones astonished everyone. The masonry was so strongly mortared with lime, sand and cement, and the stones so firmly bound with the lead and huge bands of cramp-iron which fastened the sections together, that tearing it down was very difficult and needed great force.[167]

G. J. Wightman expresses the opinion that before Frederick II had left Jerusalem in 1229, he had installed members of the Teutonic Knights in the Tower of David and the Citadel complex, and it was they who had initiated repairs between 1229–39. He also suggests that the reference to the St. Stephen's gate (the Damascus Gate today) and repairs to the walls "near the St. Stephen gate,"[168] indicates that the patriarch (=the Latin Church) had attempted to rebuild the city walls around the Christian quarter, where the Church of the Holy Sepulcher was located along with the residence of the patriarch. It was these refortifications that formed the pretext for an-Nasir's attack in December 1239, according to one version of the story, on the dubious basis that they violated the terms of the treaty of 1229.[169] However, it seems more likely that what really concerned an-Nasir was the possibility that Thibaut's Crusaders would try to occupy Jerusalem and attempt to extend the ten-year truce of 1229 beyond 1239.[170]

Following the disaster at Gaza, this attack on Jerusalem returned the Holy City into the hands of the Muslims and put pressure on the Crusaders in Acre to plan their next move carefully. Meanwhile the patriarch of Jerusalem, Gerold of Lausanne, who had returned from his four-year-long visit to Rome in 1237, died. At his death he deposited the generous sum of 16,000 besants with the Templars for the defense of the Holy Land, attesting to his skills in administering this see.[171] His demise left the position vacant until his successor could be named. This time the pope acted quickly, naming Robert, bishop of Nantes, to succeed him. Robert had been expelled from his see in Apulia and translated to Nantes because of his opposition to Frederick II, and was now therefore a perfect choice as Gregory IX saw it. Until Robert could come to

Acre, he appointed Peter of Sargines, archbishop of Tyre, as his vicar.[172]

Given the failure of his Crusade to accomplish the first goal decided on at the council in Acre in October of 1239, Thibaut understandably acted with caution. In the face of the loss of Jerusalem in December 1239, it would have been foolhardy to attempt to attack Damascus according to the original plan, that is, with no Ayyubid ally. However, a possible new opportunity presented itself. Thibaut had been in contact with the emir of Hama, al-Muzaffar, during the fall of 1239. Just as the new year, 1240, began, al-Muzaffar, a loyal supporter of the imprisoned Ayyub, requested the aid of the Crusaders against the princes of Homs and Aleppo. He reportedly also dangled the idea that he was interested in learning about the Christian religion as part of his request. Thibaut thought this overture serious enough to warrant moving the Crusader army north to Tripoli at the start of 1240. However, when the army was established in Tripoli, its presence was impressive enough to deter al-Muzaffar's rivals. Without the political and military pressure on the emir, his talks with Thibaut collapsed and nothing came of this potential collaboration, much to Thibaut's disappointment.[173] His army returned to Acre by May 1240.[174] Thibaut was beginning to see firsthand the complexities of dealing with his Muslim adversaries.

All was not lost for Thibaut, however, thanks to the seething rivalries among the Ayyubid princes. In the spring of 1240, al-Adil, sultan of Egypt, while rejoicing that his brother had been incarcerated at Kerak and therefore removed from the power struggle, attempted to persuade al-Nasir Daud to send Ayyub in an iron cage to Cairo by offering him 400,000 golden *dinars* and control of the city of Damascus. Al-Nasir Daud replied coolly that when al-Adil had taken Damascus from its current lord (al-Salih Ismail) and delivered it to him, along with the money, he would deliver his brother in the iron cage. When al-Adil could not turn control of Damascus over to al-Nasir Daud, however, the latter turned around and made an arrangement with his prisoner, Ayyub, to liberate him and assist him in his quest to conquer Egypt. Al-Nasir Daud and Ayyub journeyed to Jerusalem where they formed an alliance and planned their attack on Cairo.[175] In the face of this threat, Al-Adil sent for al-Salih Ismail in Damascus to bring his army to the defense of Cairo, but during this activity al-Adil was deposed by a conspiracy of Ashrafi emirs and Mamluks. In the wake of this upheaval, during late May 1239, letters were sent to Ayyub, inviting him to come to Cairo and assume the sultanate of Egypt.[176] Ayyub arrived in Cairo in mid-June 1240. Ayyub then took the throne in the citadel, installed al-Nasir Daud as his vizier, and confined al-Adil to house arrest. It was a remarkable bloodless coup, but it would not remain bloodless for long.[177]

Meanwhile Ayyub's triumphal entry into Cairo and his promise to install al-Nasir Daud in Damascus clearly caused alarm among the Ayyubid princes, especially al-Salih Ismail in Damascus and the new emir of Homs, al-Mansur Ibrahim. As viewed by al-Salih Ismail, the emir he had driven from Damascus was now the sultan of Egypt; it was clearly a dangerous situation! It is in this context that al-Salih Ismail contacted Thibaut of Champagne requesting aid. The Paris Eracles says he sent a messenger to Thibaut, who was now at Sephoris, seeking a defensive alliance; this occurred in June 1240.[178] As Jackson points out, this was probably not the first contact between these two leaders, but it was a major new opportunity for Thibaut to win territorial gains for the Crusaders by treaty that military action had failed to accomplish.[179]

Both Thibaut and al-Salih Ismail pledged to defend each other's land against Ayyub, and both agreed to make peace with him jointly, not alone. Specifically, the Crusaders agreed to secure the southern frontier against Ayyub by camping at Gaza in order to prevent an Egyptian army from entering Syria. As territorial concessions, al-Salih Ismail effectively ceded the land of the Latin Kingdom west of the Jordan River as it existed before Saladin's conquest. This included Jerusalem, Jericho, Nablus and Gaza, land claimed by al-Nasir Daud. Jackson argues that in fact Thibaut reached a separate accord with an-Nasir Daud over these holdings, when the latter left Egypt in July 1240 having realized that Ayyub had no intention of installing him in Damascus.[180] Al-Salih Ismail also surrendered some of his own important possessions, including the castles of Beaufort and Safed, Tiberias, the castles of Toron and Hunin, and those parts of Sidon still in Muslim hands. Some of these holdings had been included in the treaty of 1229, but the Crusaders had not been able to take control of them.[181]

The terms of these treaties, both of which were concluded in July 1240, have, according to Jackson, been conflated into one, in the name of al-Salih Ismail and characterized as "one of the most humiliating offers which any Ayyubid prince had yet been forced to make to the Franks."[182] In fact, the terms caused outcries and consternation on both sides. Muslim imams denounced al-Salih Ismail – but not an-Nasir Daud – from the pulpit of the Umayyad Mosque in Damascus, just as al-Kamil had been denounced before him, no doubt again, as with the treaty of 1229, because of the loss of Jerusalem. The Muslim commander of Beaufort even refused to surrender his fortress, and al-Salih Ismail had to go personally and force him out before it could be handed over to Balian of Sidon.[183] Dissension was brewing in the Crusader army as well, but Thibaut moved quickly hoping to avoid controversy. Taking his army into the territory south of Jaffa, where they may have been joined by troops of al-Salih Ismail's army, Thibaut and his men began the refortification of Ascalon as a base of operations for the defense of the kingdom against attack from Egypt.[184]

> When the king of Navarre [Thibaut] and the army of Christendom had secured this truce, they all went together to Ascalon. Here they found ample supplies of stone and building material, for the noble city of Ascalon had been a very great place. They began to repair one of its castles and to build good towers and dig good ditches. Each individual was glad to help in the work, and all could see that it was well done and very strong.[185]

The Rothelin Continuation continues:

> Then they began to talk and say that it would be a good thing if some plan could be made for setting free the Christians captured at Gaza.[186]

At this point in the contemporary written accounts it must be said that the chronology and sequence of events is exceedingly confused in both the Crusader and Muslim sources. Between the beginning of July and the end of September a number of unlikely developments altered the Crusader situation, at the end of which, and apparently as a result of which, Thibaut of

Champagne decided to return home. First, in relation to the treaties of July 1240, many Christian soldiers were upset that there were no provisions for the return of the prisoners taken at the battle near Gaza, an opinion strongly reflected in the text of the Rothelin Continuation. Second, Runciman claims, apparently mainly on the basis of the Paris Eracles, that the Templars had financial connections with Damascus at this time, and they had conducted the negotiations on the Crusader side leading to the treaty with al-Salih Ismail in July 1240, which the Hospitallers had not fully agreed to.[187] As a result of this treaty the Templars apparently took possession of the ruined Castle of Safed and rebuilt it, which upset the Hospitallers.[188] This rebuilding, which went on for several years, even apparently occasioned a bloody massacre of Muslim prisoners working on the refortification of the castle by the Templars, according to Muslim sources.[189] Third, Jackson claims that Thibaut was in contact with both Ayyub in Cairo and an-Nasir Daud, who had now been restored by al-Salih Ismail to his claim over Nablus.[190] Fourth, the Paris Eracles, in contrast to the Rothelin Continuation, indicates that there was a serious split in the Crusader army at this point, dividing Hospitallers and Templars.

The split seems to have developed over the issue of freeing the Gaza prisoners. While the Crusader army was in the south, some of the soldiers of al-Salih Ismail had deserted to the Egyptian side, not wishing to work with Christians. That was seen perhaps as a betrayal of the terms of the July 1240 treaty of mutual defense against Egyptian forces, and led to discussions with the sultan of Egypt whose army held those prisoners. The Paris Eracles says the Master of the Hospitallers pursued and arranged a new treaty with Sultan Ayyub of Egypt without speaking to al-Salih Ismail of Damascus, or for that matter, paying attention to an-Nasir Daud, neither of whom could arrange for the release of the prisoners. Ayyub promised to return all of the Crusader prisoners in exchange for Crusader neutrality on the battlefield. For their part, however, the Templars and their supporters were not willing to break the accords of July 1240, known mainly under the rubric of the treaty with the sultan of Damascus, al-Salih Ismail.

Whatever Thibaut of Champagne may have thought about the terms of the July 1240 treaties, he apparently welcomed the new treaty with Sultan Ayyub of Egypt in September. This enabled him to free his comrades-in-arms, especially Amaury of Montfort, Philip of Nanteuil, and other French soldiers.[191] Arguably he could have seen this last treaty as but one in a series that enabled him to move toward the goals he sought, namely, the control of Jerusalem and the lands of the Latin Kingdom, and the integrity of the Crusader army. However, he was apparently unprepared for the negative outcry over what was seen by others as his shifting position. At this point, Thibaut may well have pondered the idea that what was called for in the Latin Kingdom as commander of the Crusader army was a professional diplomat rather than a soldier, neither of which was necessarily his forte.[192] In any case, even though the terms of the new treaty were arranged to be completed within forty days, he decided he had fulfilled the responsibilities associated with his vow of taking the Cross.[193] Accordingly, after he and Peter of Dreux made a personal pilgrimage to Jerusalem, they boarded a ship for the West on the fall *passagium* in late-September 1240.[194] Some of his comrades remained in the Holy Land. Indeed Hugh of Burgundy, Guigues, count of Nevers, and some of Thibaut's followers stayed at Ascalon to complete work they had begun there.[195]

Fortunately for the Crusader army and the Latin Kingdom, a new leader arrived shortly after Thibaut of Champagne departed. He was Richard, earl of Cornwall, a wealthy and powerful English knight. He was not only the brother of Henry III, but also, his sister, Princess Isabel of England, was the new – third – wife of Frederick II following their marriage on 20 July 1235 in Worms.[196] As the brother-in-law of the emperor, he also came with Frederick II's full support; Frederick had delegated to him power to do what was best for the Latin Kingdom.[197] Richard arrived in Acre in early October 1240.

Upon arrival he found the situation in the Latin Kingdom in disarray. Quite apart from the lingering presence of the imperial standoff with the Ibelin supporters, the Templars and the Hospitallers were in open conflict over the successive treaties. The Teutonic Knights were meanwhile carefully avoiding involvement in this dispute, maintaining their garrisons in Syrian castles and carrying on an active presence in Cilicia with the support of the Armenian king. The Templars, who favored the treaty with al-Salih Ismail of Damascus, had the support of most of the resident Crusader lords; the Templar knights were mostly camped at Jaffa at this point. The Hospitallers, who favored the treaty with the sultan of Cairo, were mostly camped in Acre. As the Paris Eracles remarks, "thus the Christians' affairs were full of discord and dissension, as one party adhered to one truce and the others to the other."[198]

Both the Paris Eracles and the Rothelin Continuation devote only one brief chapter to Richard's activities in the Holy Land, but the former is much more informative.[199] Clearly while Richard was in Acre, the Hospitallers advocated the merits of the Crusader alliance with Sultan Ayyub of Egypt, whereas when he went to Jaffa, the Templars put forth the advantages of the treaty with al-Salih Ismail of Damascus. Neither the Paris Eracles nor the Rothelin Continuation mentions an-Nasir Daud at this point, however, nor, so far as we know, did the emir make any attempt to negotiate a new agreement with Richard of Cornwall.[200]

In his own account of the developments, Richard says in fact that it was the Sultan Ayyub of Cairo who initiated contact by sending an envoy, Kamal ad-Din ibn al-Shaykh, to propose terms of an agreement with him while he was in Jaffa. Eventually, by November 1240, Richard was persuaded to accept his terms.[201] Neither the Paris Eracles nor the Rothelin Continuation refers to a separate treaty between Richard and Ayyub at this point, only the fact that Richard did not wish to break the terms of the previous accords.[202] Unfortunately for Richard of Cornwall, no text of the treaty he concluded with Ayyub is extant, only the text of Richard's letter to his friends.[203] Apparently the only clear gain that it provided was the actual release of the prisoners negotiated earlier by Thibaut of Champagne. All of the territorial concessions listed by secondary sources indicate, according to Jackson, that "the 1241 treaty merely recognized the Franks' rule over territories which they had acquired from Ayyub's enemies – though by virtue of truces that were no longer operative."[204]

What the Paris Eracles and the Rothelin Continuation do describe as Richard's primary activities during his time in the Holy Land include the completion of the refortification of Ascalon.

The Paris Eracles says that the castle was rebuilt in the manner of King Richard "The Lionheart," Richard of Cornwall's uncle, who personally worked at Ascalon during the Third Crusade.[205] As the *bailli* of Ascalon, Richard installed Walter Pennenpié, who had previously been the imperial *bailli* at Jerusalem. The Rothelin Continuation then provides a succinct account of the rest of Richard's time in the Holy Land:

> He and the duke of Burgundy stayed there until the castle was finished, made secure, and well provided with everything needed to endure a siege, men-at-arms, engines, food and other things. After that they made their pilgrimage to the holy city of Jerusalem and to all the other holy places in the land of Outremer that they could go to.[206] Then they left to go safely back to their own lands and their own countries. Thus all these many men did almost nothing in the Holy Land that was of any use, and yet when they first set out to go there, everyone said they would bring great gain and great honour to God and to Christendom.[207]

In hindsight, the Crusades of Thibaut and Richard have been regarded very differently, the former quite negatively and the latter quite positively. In fact, however, Thibaut's Crusade, though it achieved little by military action, had accomplished more than Frederick II did by diplomatic maneuvering. Jackson's arguments clearly make a strong case for Thibaut's treaties being more important than that of Richard.[208] Whether this occurred by careful calculation and diplomatic skill on the part of Thibaut of Champagne, or by good luck and sheer opportunism, cannot be fully determined. However, as we have seen, these accomplishments took place despite the fact – or perhaps because of the fact – that when Thibaut arrived in the Latin Kingdom, the nobles of Outremer and the Ayyubid princes were involved each in their own separate civil wars. One way or other he succeeded in initiating major Crusader gains where there was, on the face of it in the fall of 1239, little hope for success.

Richard, of course, gets the credit for following through with the terms of the treaties that Thibaut had entered into, but whose provisions had not been fully completed. Richard was also by far the more celebrated knight. However, what he accomplished in the Latin Kingdom had more to do with public relations, putting on a good show. Tyerman states it succinctly: "Richard's crusade flattered to deceive; its achievements were minimal."[209] Nonetheless, when viewed together, there can be no doubt that Thibaut of Champagne and Richard of Cornwall would be the last major Crusader commanders who led armies into the land of *Outremer* during the thirteenth century and who successfully accomplished significant territorial gains in the Holy Land.[210]

When Richard of Cornwall left the Holy Land on 3 May 1241 and others from this Crusade sailed later on the fall *passagium*,[211] there were significant dark clouds on the horizon in the Latin Kingdom. Even though we do not know exactly what the effect of Thibaut's and Richard's successive Crusades had been on the feud between the imperialists and the Ibelins, the standoff had not been resolved. "The crusades may have had the effect of tilting the balance of power somewhat in Filangieri's favour, but it is difficult to be sure."[212] On top of this there continued to be open hostility between the Templars and the Hospitallers, which led to divisive alignments and entanglements with the Muslims, the Templars favoring an alliance with Damascus, the Hospitallers one with Cairo. Finally, two of the major maritime powers tended to line up with one or other of these factions, the Venetians with the Templars, the Genoese with the Hospitallers, with the others, including the Pisans, the Provençals, and the Catalans, taking their own independent positions. Furthermore, a serious new threat had appeared in the northeast. A force of Khwarismian Turks crossed the Euphrates and raided Aleppo in early November 1240. In January of 1241 they again marched into Syria, getting as far as Shayzar. Al-Mansur Ibrahim was able to repel them in battles at Raqqa and Edessa in February and April 1241, respectively.[213] However, the appearance of the Khwarismians together with threats posed by the Seljuks and the Mongols, along with the Ayyubids warring among themselves, created a dangerous situation for the Crusader States. The Latin Kingdom in particular was still struggling with the divisive legacy of the civil war and the lack of a resident ruler.

At this point, in June of 1241, the idea that some kind of compromise seemed possible between the imperialists and the Ibelins inserted a brief ray of hope into the situation in the Latin Kingdom. After Richard of Cornwall's departure, a group of the most prominent Ibelin nobles prepared a petition to send to Frederick II seeking peace.[214] After requesting pardon for the wrongs that had occurred during their dispute, they asked the emperor to appoint Simon de Montfort, the celebrated earl of Leicester and cousin of Philip of Montfort, as his *bailli*. The barons asked for Simon de Montfort to serve until Frederick's son, Conrad, king of Jerusalem, entered his majority and would come to the Holy Land to rule, or until the king would send someone else to rule on his behalf. For their part, the local barons proposed to obey the *bailli* and dismantle the commune of Acre. Simon de Montfort would be expected to take an oath to uphold the rights of Frederick II and Conrad, and to govern by the customs and the laws of the Latin Kingdom.[215]

The document is dated 7 June 1241,[216] and therefore must have been taken West by someone after Richard of Cornwall had left. Edbury agrees with Prawer that the author of the document, "John of Ibelin," was probably the count of Jaffa, not the count of Arsur.[217] It was guaranteed by four lords: Balian of Beirut, Philip of Montfort, lord of Toron, John, lord of Arsur, and Geoffrey of Estreing, lord of Haifa, who attached their seals to the document.[218] Mayer and Runciman do not seem to doubt that this petition was sent to Frederick and that he received it, but Edbury wonders whether, in fact, it ever reached him.[219] In any case, Frederick II never replied to it and a golden opportunity for ending the civil war and achieving political peace in the Latin Kingdom, on what seem to be mutually beneficial terms, was lost.

Neither the Paris Eracles nor the Rothelin Continuation mentions this document. Following their account of the departure of Richard of Cornwall, both texts offer differing narratives. The Rothelin Continuation mostly discusses the conflict between Frederick II and the popes in the years 1241–4.[220] This was a difficult period for the papacy, from the death of Gregory IX on 22 August, to Celestine IV, who only reigned for two weeks, from 25 October to 10 November 1241, and finally to Innocent IV, who did not come to office until 25 June 1243, after an interregnum of nineteen months. The Paris Eracles by contrast deals with certain events in the Latin Kingdom, along with mention of the papal developments. Nonetheless the information about the period between 1241 and 1244 is very brief and focuses mostly on Filangieri, Ralph of Soissons, and his wife, Alice, at Tyre, before discussing the invasion of the Khwarismian Turks.[221] Thus we must reconstruct the events in the Latin Kingdom between the summer of 1241 and the fall of 1243 from a collection of various sources.

While the Ibelins waited for their petition to gain the attention of Emperor Frederick II, the barons were forced to deal with the unwelcome attempt of Richard Filangieri to gain control of Acre. Shortly after the fall *passagium*, when the remaining members of Thibaut's and Richard's Crusades had left for the West, Richard Filangieri observed a strategic moment when only one important Ibelin lord, Philip de Montfort, was residing in Acre, and Odo of Montbéliard, constable of the kingdom, was away at Caesarea.[222] Philip de Novare tells the story in detail.[223] Acting with the assistance of two accomplices, William of Conches and John Vaalin, who were burgesses of Acre, and with the Hospitallers in the city, Filangieri came to Acre secretly at night and stayed in the Hospital of the Knights of St. John. When Filangieri and his accomplices attempted to gather supporters to their cause, Philip de Montfort found out about the plot and raised the alarm. The Genoese and the Venetians armed their people and closed their quarters immediately. Philip had William of Conches and John Vaalin captured and imprisoned, while he sent for Balian at Beirut. Hearing that his accomplices had been captured, Filangieri, in hiding in the hospital, escaped from Acre under cover of darkness. Balian came quickly and took command of the city, where he besieged the hospital relentlessly for no less than six months. He was presumably hoping to capture Filangieri, but the imperial *bailli* had already fled. In any case, the Hospitaller Master and most of his men were at Margat north of Tortosa at this time, doing battle with the Ayyubid ruler of Aleppo, and could not return to Acre right away. When they did return in April 1242, Balian, finally realizing that Filangieri had left, raised his siege and he and the Hospitallers were reconciled.

This abortive attempt by Filangieri to take control of the capital city was an important development in the Latin Kingdom for several reasons. It demonstrated that reconciliation between the Ibelins and the imperialists, as envisioned in the peace proposal of June 1241, was unrealistic. It further showed that despite Philip de Novare's characterization, that because things were "settled to the satisfaction of both parties [Balian and the Hospitallers], these things which are past should be entirely forgotten,"[224] the Hospitallers were sympathetic to the imperialists. Furthermore, the Hospitallers would remain aligned along imperialist lines in the Latin Kingdom and Cyprus and with Hohenstaufen interests in the Near East, including Egypt, until Frederick's power in the Levant collapsed in 1242, and even later.[225] Finally, whereas this episode did not result in open warfare between the Hospitallers and the Templars, their part in the simmering civil war continued on into 1242.

The events of 1242 and 1243 in the Latin Kingdom have posed extraordinary problems in terms of chronology, mainly caused by the issue of determining the pivotal date when King Conrad reached his majority,[226] and the confused sequences of events as reconstructed from certain sources. Recent scholarship has more or less reached a consensus on the fact that Conrad's coming of age was announced early in his fifteenth year, that is, 26 April 1242–26 April 1243, counted from his birthday on 26 April 1228, not on the occasion of his fifteenth birthday.[227] By moving this pivotal date up to the spring of 1242, the sequence of events reported by Philip de Novare, John of Jaffa, and others, leading to the critical appointment of Queen Alice as regent for the king of Jerusalem, and the Ibelin capture of Tyre, is located between April and July 1242, not 1243 as interpreted by earlier scholars.

Shortly after the siege of the hospital in Acre by Balian had ended in April, and Conrad's declaration of his majority had been received, that is, in May 1242, Venice sent Marsilio Zorzi to Acre. Marsilio's mission as *bailo* was to restore the Venetian position in the Latin Kingdom, especially in the ports such as Acre and Tyre. Marsilio's report on his activities is important, as David Jacoby has argued, as a source for the correct dating and sequence of events between May and July 1242.[228] When Marsilio arrived in Acre in May, he worked hard to reestablish Venetian rights and property in the Latin Kingdom. He found Filangieri unwilling to restore Venetian income and property in Tyre, however; indeed, the imperial *bailli* even refused to receive the Venetian envoys. Partly for this reason Marsilio approached Philip de Montfort and other barons to discuss means by which Tyre could be wrested from imperial control.

Marsilio Zorzi's activity was one factor along with several others that led to two major events in June 1242. Conrad's letter to the liegemen of the Latin Kingdom announcing his coming of age and his appointment of Thomas of Acerra as his *bailli*, along with Frederick's letter recalling Richard Filangieri, the latter which must have become known in late May, led Balian of Beirut to call a meeting of the baronial council. As Jacoby described the situation, "they recognized Conrad as the lawful ruler of the kingdom and vowed to safeguard his royal rights, according to custom, pending his arrival in his realm. Until then, however, they would not be bound toward him by his letters or his messengers, according to the usage of the kingdom."[229] To fill what the barons saw as a constitutional void until such time as Conrad would come to be duly crowned and receive the homage of his vassals in the Latin Kingdom, they hastened to select a new regent. Odo of Montbéliard was elected, but he opposed any Ibelin attempt to capture Tyre, much to the consternation of the assembly.[230]

The two main accounts, by Philip de Novare and John of Jaffa, differ somewhat about what happened next, but they are not necessarily contradictory.[231] John of Jaffa's version is quite short, but it mentions at least two meetings of the council, the first where Odo of Montbéliard is made *bailli*, and the second where Alice is elected in his stead.[232] Philip de Novare only mentions one meeting, but he goes into considerable detail, and credits himself for identifying the legal basis of Alice's claim both to be regent and to hold the city of Tyre.[233] Alice of Champagne was the mother of King Henry I and widow of King Hugh I of Cyprus, and she was the lawful heir of the Latin Kingdom because she was the daughter of Queen Isabel I, who herself was the daughter of King Amalric I of Jerusalem. Only Conrad, who was descended from an older sister of the royal blood had a stronger claim as heir, but Alice, who was Conrad's great aunt, was the most lawful heir apparent, until he should come.[234]

Accordingly, on 5 June, Balian of Beirut and Philip of Montfort called a meeting of the liegemen of Acre in the residence of the patriarch of Jerusalem. The new patriarch of Jerusalem, Robert of Nantes, had not yet arrived in the East, but he had appointed as his vicar Peter, archbishop of Tyre, who was present with the bishops of the kingdom. The Crusader lords were there, along with representatives of the Templars, the Genoese, the Venetians, and the Pisans, and all the confraternities of the city. The masters of the Hospitallers and the Teutonic Knights are not mentioned, and were no doubt absent given their pro-imperial stance, but representatives must have been present.[235] In the presence of the assembly, Queen Alice was elected regent of the Latin Kingdom for Conrad. At the climactic moment, the "first of them all did homage to the lord of Beirut and next the lord of Toron and afterwards all the other knights of Acre. And this was in the year 1242."[236]

Acting quickly following this meeting, the new regent, Alice, made a formal request that the city of Tyre be turned over to her. When Lotario Filangieri refused to relinquish control of the city, Alice ordered her commanders to organize their troops and attack immediately. Her husband, Ralph of Soissons, along with Balian of Beirut, Philip de Montfort, and Philip de Novare serving as her royal *bailli*, assembled their army, moved to Tyre, attacked on 9 June, and took possession of the city on 12 June. Lotario Filangieri was able to hold out inside the citadel for another month. On 10 July the citadel surrendered as well when Richard Filangieri, who had been captured on his return from an attempt to sail to the West, was threatened with hanging in view of his brother, Lotario, inside the citadel. Lotario sued for peace to save Richard.[237] The imperialists were given generous terms and allowed to depart under safe conduct with their men. Lotario joined Thomas Acerra in Tripoli where they were received by Bohemond V. Richard Filangieri returned to Apulia as ordered, where Frederick II, angered by his failure to take control of Acre or maintain imperial power in Tyre, had him imprisoned. Philip de Novare ends his account of the siege of Tyre as follows:

> Thus was rooted out and cast away the evil nest of the Langobards so that never after did they have any power in Syria or in Cyprus. Thus was taken the city of Tyre and the castle in the year 1242.[238]

The loss of Tyre and the departure of the Filangieri meant that the imperial presence in the Latin Kingdom was gone; Hohenstaufen power had collapsed in the Holy Land. Jerusalem and Ascalon officially passed into the control of the regent of the kingdom. Some years later, in 1247, Pope Innocent IV would absolve King Henry of Cyprus of his oath to the emperor and place the kingdom of Cyprus under papal protection, thus completing the eradication of imperial jurisdictional presence in the kingdoms of Cyprus and Jerusalem. The barons, and especially the Ibelins, had, by supreme effort and perseverance, finally eliminated active imperial intervention in the Latin Kingdom. The civil war was over and the political and territorial divisions that had caused so much pain and hardship for so many years were substantially ended. That is not to say that pro-imperialist sympathizers, such as the Hospitallers, the Teutonic Knights, and the Pisans, disappeared. However, there was a new order in the Latin Kingdom, where the commune of Acre was finally gone and the high court of the kingdom had reappeared.[239]

Part of the new order was revealed at once when Alice's husband, Ralph of Soissons requested that Tyre be given over to them as their holding. Balian of Beirut and Philip of Toron, who now controlled the military power, refused. As reported in the Paris Eracles, it became apparent immediately to Ralph of Soissons "that he would have no power or authority, but that he would be no more than a shadow. So shamed and deceived, he abandoned everything, left the queen his wife and returned to his own land."[240] This event among others demonstrated clearly that the new order focused power ever more firmly in the hands of the Crusader lords, and that the monarchy had been severely weakened. Although one can point to developments in the West that also reflect changes in the balance of power between the crown and the feudal lords, as seen in England with the Magna Carta, for example, nothing can compare with what happened in the Latin Kingdom by 1242, in the thirteenth century. The Latin Kingdom of Jerusalem was now a kind of feudal republic, with its own sophisticated legal codes and courts, but it had no clear leader and lacked any real unity. Without a strong ruler, how would the Crusader Kingdom establish a united front among its many factions to meet the challenges that lay ahead?

Two immediate questions now loomed for the Crusader lords. Could they translate their hard-won victory over the imperial forces into consolidating their territorial gains from the treaties of Thibaut of Champagne and Richard of Cornwall? Could they strengthen the military power of the kingdom against outside attack? For the latter, they would be put to a severe test in only two years' time. For the first year, 1242–3, they seemed to hold their own in the face of mounting danger, led by the Templars.

The Templars had been active and would continue to go on the offensive in both diplomatic and military matters when necessary. They had been instrumental in arranging the Frankish–Damascene treaty in the summer of 1240 during the latter part of Thibaut's Crusade. Now that the imperialists had been overcome in the kingdom during the summer of 1242, leaving the Hospitallers in eclipse, the continuing Templar interests in Damascus led to the reopening of negotiations with al-Salih Ismail. Militarily, they had attacked Hebron in the spring of 1242, then in May they joined forces with al-Nasir Daud in a battle against Egyptian troops between Gaza and Jerusalem, and finally they attacked Nablus in the fall. The Nablus raid was particularly bloody, a three-day affair that started on 30 October 1242 in which the mosque was burned with the people inside it.[241] Christians living in the city were said to be victims along with the Muslims. Many women and children were carried off to be sold on the slave market. Barber points out that however savage this operation was, it was conducted "apparently in revenge for a previous massacre of Christian pilgrims by al-Nasir [Daud], an expedition of which the Order was sufficiently proud to commemorate in a striking fresco in its church at Perugia."[242]

The Templars were even prouder of their success in regaining access to the Haram al-Sharif in Jerusalem. They were able to negotiate the return of the Haram, including their former headquarters in Jerusalem, to Christian control by the end of 1243.[243] This came about partly because the situation in Muslim territory to the north and east was extremely volatile. To some extent the then-current Mongol and Khwarismian threats can be said to have made the Crusader repossession of the Haram possible, along with the struggle for power among the major Ayyubid rulers.

On 2 July 1243, the Mongols inflicted a crushing defeat on the Seljuks and their Ayyubid and Khwarismian allies led by Sultan Kai-Khusrau II, at Köse Dagh in the rugged territory of what is today northeastern Turkey. As a result of this loss, the death-knell of the Seljuk state in Asia Minor was sounded, and a Mongol presence was established in Mesopotamia that the Mamluk successors to Sultan Ayyub would have to confront later.[244] It was, however, the Khwarismian Turks, not the Mongols, who presented an immediate threat to the Muslim emirs in Syria, not to mention the Crusader States along the coast. Pushed eastward in front of the advancing Mongols, these Turkoman peoples from Transoxonia occupied parts of Armenia and Azerbaijan at the start of the thirteenth century. Having suffered a disastrous defeat in 1230, however, they had become fragmented into bands of mercenary raiders who served whoever would give them refuge. Championed at first especially by Sultan Ayyub in Egypt, in the early 1240s they had fought for a whole succession of rulers including the caliph at Baghdad, the emir of Mosul, al-Muzaffar Ghazi of Mayyafariqin,[245] the Seljuks, and al-Salih Ayyub himself, against a variety of Ayyubid foes in Syria. At the time of the Mongol victory at Köse Dagh in July 1243, the Khwarismians were located in Kharput, northeast of Melitene, uncomfortably close to the new Mongol presence. Following this momentous battle they would be forced to move again into the Jazirah and they were available to strike.[246]

Meanwhile, in the late spring of 1243 the Franks had joined al-Salih Ismail's new attempt to attack Egypt, along with al-Mansur Ibrahim of Homs, by marching on Gaza. An-Nasir Daud of Kerak, who had oscillated in his alliances between al-Salih Ismail in Damascus and al-Salih Ayyub in Cairo, was currently also attacking the Egyptian-held castle of Shaubak (Montréal) north of Petra. All of this came to nothing, however, when, in the wake of the Seljuk loss at Köse Dagh in July, the invading Ayyubid troops withdrew from the Egyptian frontier. Diplomatic relations were then opened between Damascus and Cairo and a new agreement emerged. By the provisions of this agreement, on 11 September 1243 al-Salih Ismail removed Kai-Khusru's name from the *khutba*[247] in the great mosque of Damascus and replaced it with that of his former protagonist, al-Salih Ayyub in Cairo. He also prepared to release Ayyub's son from the jail in which he had been held for the previous four years. Al-Mansur Ibrahim recognized the sovereignty of Sultan Ayyub in Aleppo, as was also done in Homs. Ayyub reciprocated by finally acknowledging the authority of al-Salih Ismail in Damascus in place of Ayyub's son. As a result of these developments the alliance against Ayyub was eliminated, and the principals in this new group, Ayyub, Ismail, and al-Mansur, now turned their attention to attack al-Nasir Daud. Al-Nasir was, of course, the very Ayyubid prince who had most recently captured Jerusalem in 1239, but there was no denying that he was also a threat to them all. Indeed he was also the Muslim ruler who held the territory that interested the Crusaders the most, which Ayyub had relentlessly sought to control. At this moment, however, the new alliance foundered on the discovery that Ayyub had secretly contacted the Khwarismians, requesting that they join him in an attack on Syria after his son was safely out of al-Salih Ismail's hands. The new coalition fell apart on this news and the old alliance was reborn.[248]

It was at this opportune moment that the Templars succeeded in negotiating a new treaty with al-Salih Ismail in which the earlier provisions agreed on by Thibaut of Champagne and Richard of Cornwall were reconfirmed, but Jerusalem was given over to the Crusaders in its entirety.

The Ayyubid coalition apparently decided that in seeking support against Egypt, the Franks were more to be relied on than the emir of Aleppo, whose territory was currently at risk in the face of the Khwarismian threat. Al-Maqrizi describes what happened as follows:

> Al-Nasir Dawud and al-Salih Ismail then sent ambassadors to the Franks, and compacted [sic] that the Franks should aid them against al-Malik al-Salih Najm-al-Din [Ayyub] while they in return surrendered Jerusalem. They (also) surrendered Tiberias and Ascalon, the citadels of which two cities the Franks restored. The Franks gained possession of the Dome of the Rock in Jerusalem, and set wine bottles on the Rock and hung bells in the al-Aqsa Mosque.[249]

The *Annales de Terre Sainte* reports laconically that Jerusalem and the *Templum Domini* was returned by truce with al-Salih Ibrahim and an-Nasir Daud.[250]

The date of this treaty is not known but it must have been completed and signed in late 1243. Shortly thereafter the Grand Master of the Templars, Armand de Périgord, wrote a long letter to Robert of Sandford, a Templar preceptor in England, explaining what had happened and trumpeting his success:

> there should be rejoicing among angels and men, that the holy city of Jerusalem is now inhabited exclusively by Christians, all the Saracens having been expelled, and that in all the holy places, restored and cleansed by the prelates of the church, where for fifty-six years the name of God had not been invoked, now, God be praised, the divine mysteries are celebrated daily.[251]

By "all the holy places," of course Armand meant especially the sites of the *Templum Domini* and the *Templum Salomonis*, the latter which had been, up until the loss of Jerusalem in 1187, the headquarters of the Knights Templar. The occupation of the Haram al-Sharif was symbolic not only of the current Templar ascendency in affairs of the Latin Kingdom, but also of the elimination of imperial policy.[252] It was a notable diplomatic achievement.[253] It was also one of the briefest in duration, lasting from December 1243 to August 1244, a total of only nine months.

THE FALL OF JERUSALEM TO THE KHWARISMIAN TURKS (AUGUST 1244) AND THE BATTLE OF LA FORBIE (OCTOBER 1244)

On the whole, the Crusaders in the Latin Kingdom had been able to deal successfully with the volatile situation around them between July 1242 and December 1243 as we have seen. A few months after Pope Innocent IV took office in June 1243, he received the good news that Jerusalem was back in Crusader hands. It was also in the early spring of 1244 that Robert of Nantes, the new patriarch of Jerusalem, arrived in the Holy Land to occupy his see, at which time he made his pilgrimage to the Holy City when it was in Crusader hands.[254] However, the euphoria was short-lived; no one could have foreseen the disasters looming ahead.

In 1244, following the rainy season, the attack on Syria that Sultan Ayyub had urged the Khwarismians to make began. Just before the Mongols launched an assault on Aleppo in May/June, the Khwarismians crossed the Euphrates and rode ahead of them into Syria, dividing their forces. One army entered the County of Tripoli, the other, the land around Damascus. Al-Salih Ismail consolidated his forces at Damascus to resist their invasion, but an-Nasir Daud retreated to the safety of Kerak, leaving Palestine to be defended alone by the Crusaders. When the Khwarismians entered Galilee, Samaria, and Judaea they began attacking the cities, starting with Tiberias and Nablus. On 11 July they arrived at Jerusalem, which had almost no fortifications. The Crusaders had been surprised by their onslaught, making it difficult to organize a solid defense. There had only been time for the patriarch, Robert of Nantes, who had recently arrived in the Latin Kingdom, and the masters of the Templars and the Hospitallers, Armand de Périgord and William de Châteauneuf, respectively, to hasten to the Holy City to reinforce the garrison in the citadel.[255]

It is at this point, with the advent of the Khwarismians, that the Paris Eracles and the Rothelin Continuation resume their narratives. The latter gives the most detail on the Khwarismian sack of the Holy City. Christians in the Church of the Holy Sepulcher were disemboweled or decapitated. The marble framework of the aedicule of the Holy Sepulcher was destroyed and some of the columns were sent to Mecca as trophies. The tombs of the Crusader kings were turned over [effondrerent les sepolturez] and the bones of the kings were scattered.[256] Other Christians attempting to flee to safety were massacred. According to the Paris Eracles, the Khwarismians took no prisoners; more than thirty thousand men, women, and children were killed.[257]

Remarkably, similar reports are given in Muslim sources with very few differences. One of the most detailed is found by Ibn al-Furat:

> The Khwarizmians then attacked Jerusalem and put the Christians there to the sword, may God curse them. Not a man was spared and women and children were taken as captives. They entered the chief Christian church known as Qumama (Holy Sepulchre) and destroyed the tomb which the Christians believe to be that of the Messiah, and they ransacked its Christian and Frankish graves, and the royal graves that it contains, burning the bones of the dead.[258]

Meanwhile the Crusader garrison in the citadel fought on, but they could only hold out until 23 August. When it was all over, remnants of the garrison made their way to Jaffa; the Holy City was desolate.

The differing points of view over what happened are tersely summarized in the following two comments: Ibn al-Furat says,

> Thus they [the Khwarismians] brought healing relief to the hearts of a believing people, may God Almighty give them the best of rewards on behalf of Islam and of its people.[259]

The Rothelin Continuation declares matter-of-factly:

> they [the Khwarismians] committed far more acts of shame, filth and destruction against Jesus Christ and the holy places and Christendom than all the unbelievers who had been in the land had ever done in peace or war.[260]

Jerusalem was now in the hands of the Muslims, and it would never again be controlled by the Crusaders. The city remained without walls, the Christian holy sites were in shambles; whatever repairs that could be made were done by Eastern Christians who were allowed to remain. Christian pilgrims would continue to visit the Holy City between 1244 and 1291, and later with varying degrees of difficulty. The Franciscans would officially arrive in the fourteenth century to administer the Christian holy sites, but no victorious Christian army would enter its gates again until 1917. Ironically, the Khwarismians themselves, who conquered the Holy City, made no claim to possess it but rather rode on immediately after their victory to join Ayyub's Egyptian army at Gaza. Here the next catastrophe for the Crusaders in 1244 would unfold in the dark days of October.

Following the Khwarismian depredations, in September 1244, the Crusaders organized a new army at Acre, enlisting every possible soldier to serve in the current emergency.[261] There they were joined by troops from Damascus and Homs under the command of al-Mansur Ibrahim and a separate force under an-Nasir Daud. It was the largest Frankish army in the field since the battle of Hattin. The allies began their march south on 4 October and made first contact with the Egyptian army thirteen days later at La Forbie, a few miles northeast of Gaza along the coast. The opposing army was powerful and dangerous; the great majority of its troops were Khwarismian cavalry, and it had a solid division of elite Egyptians led by an emir with the name of Rukn ad-Din Baibars.[262]

In order to plan their strategy, the Crusaders held a council of war. The shrewd al-Mansur Ibrahim argued that the army should take a strong position, but delay engagement in order to frustrate the impatient Khwarismians and put serious pressure on their meagre supply lines. Walter of Brienne, count of Jaffa, however, impetuously urged an immediate attack. The Frankish army overall was strong and the Crusaders no doubt sought revenge for their terrible losses at Jerusalem. The Paris Eracles explains what happens next as follows:

> Through hatred and envy amongst the Christians, through sin and misfortune, the worse plan prevailed, and so they set out from Ascalon at dawn on a Tuesday morning and rode to Gaza.[263]

It must have been a remarkable sight when the two armies drew up in ranks across from each other. Many Muslim accounts describe the unique scene. Ibn al-Furat writes:

> The two armies met outside Gaza. Ibrahim and the troops of Damascus rode under the banners of the Franks with crosses at their head and priests amongst the squadrons, making the sign of the Cross over the Muslims and blessing them, with cups of wine and goblets in their hands from which they gave them to drink.[264]

In the ensuing battle at La Forbie on 18 October 1244, the Khwarismians routed part of the Muslim forces and decimated the Crusaders. Thousands were killed, including Peter, archbishop of Tyre, and the bishop of Ramla and Lydda. Some eight hundred men were said to have been taken prisoner by the Egyptians. Armand of Périgord, master of the Templars, was captured and eventually apparently died in prison. William of Châteauneuf, master of the Hospitallers, was captured and only released in 1250.[265] The Khwarismians captured Walter of Jaffa, and tried to use him to induce the garrison there to surrender, unsuccessfully. He was later sent along with the others to Egypt. Among those Crusaders who managed to escape with their lives were Robert, patriarch of Jerusalem, who with the others went to Ascalon, where the Hospitallers held the fortifications.[266] Al-Mansur Ibrahim is reported in Muslim sources as saying, with tears in his eyes, "I realized when we were marching under the banners marked with the Cross, our undertaking could not succeed."[267]

Among Crusader defeats, the catastrophe at La Forbie is outranked only by that at Hattin in 1187. In both cases the Crusader army was destroyed, and in both cases had wiser, cooler Crusader heads prevailed, the results of the battle might well have been quite different. As it was, at La Forbie it is the greatest irony that even with an allied Muslim commander's insightful evaluation of the opposing Muslim forces, the Crusaders would not listen to military reason, but yet once again insisted on rushing headlong into battle. Fortunately for the Crusaders, Sultan Ayyub was not as formidable a commander as Saladin had been. Not only was Ayyub unable to follow up the victory of La Forbie by wiping out the Crusader military presence with an immediate and sustained attack, but also in any case his priority was focused on Damascus, not on the Crusaders, and besides he already held Jerusalem. As Runciman observes, "Ayub of Egypt still had to overcome his rival of Damascus before he could venture to finish with the Christians. This delay saved Outremer."[268]

In the years immediately following the loss of Jerusalem and the defeat of the Crusader army at La Forbie in October 1244, there were many important developments as the Latin Kingdom struggled to regroup and defend itself. Again, almost immediately, a new Crusade was proclaimed by the pope, Innocent IV, who would die in 1247, however, long before the expedition got underway in 1248. As fate would have it, when the call for a new Crusade was issued, Louis IX was seriously ill in December 1244. He vowed that if God would spare him, he would lead a new expedition. When his health returned, he began to make careful arrangements for the new Crusade.[269]

Meanwhile, there were important problems to deal with in the Latin Kingdom. The Crusaders had to worry about how they could defend themselves in the months ahead now that the flower of their fighting forces had been annihilated, both from the Latin Kingdom and from Tripoli and Antioch. The holy places in Jerusalem and Bethlehem were now definitively lost, and in disarray. Only Nazareth remained in Crusader control, however tenuously. The church would need to reassess its situation and reorganize to meet the new needs.

Sultan Ayyub organized an assault on Damascus in the spring of 1245, thus giving the Crusader States room to regroup their defenses. After a six-month siege, from April to October, al-Salih Ismail was forced to surrender the city and accept lesser holdings of Baalbek in the Bekaa Valley and the territory of the Hauran. When Ismail tried to mount a new attempt to take back Damascus early in 1246 with the help of the still unsettled Khwarismians, Ayyub repulsed him. Relieving armies sent from Homs and Aleppo inflicted a serious defeat on Ismail in May 1246, thereby ending his threat, and forcing the Khwarismians to leave Syria.[270] Unfortunately for the Crusaders, Ayyub could now focus his attention on the Latin Kingdom.

Ayyub's campaign started ominously with the successful capture of Tiberias, recently refortified by Odo of Montbéliard, of Mount Tabor, and of Belvoir, all strategic sites in the Galilee. The sultan then moved his army to Ascalon, whose walls were newly rebuilt under the direction of Hugh IV of Burgundy, before he left to return home, and whose strong garrison was manned by the Hospitallers. Despite support from the king of Cyprus and ships sent from Acre, the Muslim army succeeded in mining and battering their way into the fortress citadel, on 15 October 1247. Many Crusader defenders were killed; the rest were taken prisoner. Ayyub ordered the fortifications at this important site to be dismantled once again, for the third time since 1188.[271]

At this point, the Latin Kingdom was vulnerable and lay open to attack. Its territory was at its most reduced level since the time of Saladin. However, Ayyub was not interested to press his advantage. He had contented himself by returning to Jerusalem, where he apparently ordered work on reconstructing the walls to be commenced.[272] After a visit to the reclaimed holy sites of Islam, the Dome of the Rock and the mosque al-Aqsa, he returned to Damascus, his preferred residence by the river Barada. He received his subjects there between the fall of 1248 and the summer of 1249.

The Latin Kingdom was therefore given a much-needed reprieve. The military orders sought to recruit new members in the West. The Italian communes endeavored to strengthen themselves and the barons sought to find new settlers to fill their seriously depleted ranks. Fortunately for the Crusader States, there was very little internal dissension during these difficult years, from 1244 to 1248. Although the intense rivalries among the military orders and the Italian maritime powers did not diminish, there were no open hostilities.[273]

The new patriarch of Jerusalem, Robert of Nantes, who had survived the great defeat at La Forbie, immediately exercised his leadership in attempting to seek aid and reorganize his clergy. A letter was sent from him and his clergy imploring the rulers of the West for their aid and assistance.[274] Robert himself went West and was present at the Council of Lyon, called by Innocent IV, in June 1245.[275] Meanwhile he and the pope were forced to deal with episcopal dioceses whose lands within the see of Jerusalem had been lost as the result of the recent Muslim victories.[276] The bishop-elect of Bethlehem, John, lost possession of his see because of the Khwarismian capture of Jerusalem in August 1244. In the absence of land to support him, he attempted to raise money by selling off property belonging to his church. The pope eventually transferred him to Paphos on Cyprus in 1245, and when Godfrey de' Prefetti, former cantor of the church in Tripoli, was nominated to be the new bishop of Bethlehem, he sought to recover this property and initiated a series of lawsuits to this end.[277] The pope had succeeded in recruiting Louis IX for the upcoming Crusade, but Robert of Nantes also attempted to persuade Henry III to take the Cross. In 1247 he brought to London a vial of the Holy Blood – Matthew Paris describes it as in a "vase cristallino venustissimo" – as a gift to the king. Henry caused the sacred relic to be translated from St. Paul's to Westminster in a solemn ceremony, but he would not be persuaded to take the Cross, at least not yet.[278]

Besides the patriarch in the Latin Kingdom, the mendicant orders were also becoming more active. Shortly after the Dominicans and the Franciscans had been established as orders,[279] they appeared in the Latin East, and as we have seen, no less a figure than Francis of Assisi himself had come to the Holy Land at the time of the Fifth Crusade. Later on, in an effort to stimulate greater religious unity in the East, Innocent IV had, shortly after his election in 1243, directed members of the Dominican order to do this work in the territory of the Holy Land. In 1246, however, Lorenzo of Orte, a Franciscan, was appointed as his papal "legate in Armenia, Turkey, Egypt, Cyprus, Greece, and to all the Greeks living in the patriarchates of Jerusalem and Antioch, as well as to Jacobites, Maronites and Nestorians." His special instructions for the Orthodox of Jerusalem and Antioch were " 'that the Greeks of those regions, by whatever name they are known, be protected by papal authority, and that you do not allow them to be treated with violence, and that you do full justice to them in cases of injury caused to them by Latins.' "[280]

The powers of this legate were breathtakingly comprehensive, and his mandate brought him into conflict with the Latin patriarch of Jerusalem, where Lorenzo clearly interfered with Robert's ability to exercise jurisdiction over the Orthodox members of his see.[281] By August of 1247, the pope was forced to limit his legate's powers, stating that he had no intention of diminishing the authority of the Latin patriarch in any way. In Antioch, however, the legate's activities were more successful. The Orthodox patriarch, David, expressed a personal willingness to be reconciled to the pope. Although the pope had in mind setting up a Uniate Orthodox church in Antioch, such a plan was vigorously opposed by the local clergy on both sides. Therefore the pope let it be known that any Orthodox clergy who wished to be in communion with the Roman church could do so under certain conditions.[282] Innocent IV even went so far as to offer to pay the transportation expenses of such clergy in order that they might come to Rome for this purpose.[283]

In Tripoli and Antioch, Bohemond V continued to rule in these years, and this meant that the friction between him and the patriarch of Antioch remained, until Albert of Rizzato died in 1245 while attending the council of Lyon. It was two years until a successor was named, Opizon Fieschi, and then another year until he arrived in the East, in 1248. In the meantime, Bohemond's quarrels with his Armenian neighbors also continued, but, encouraged by the pope, he followed a policy of minding his own business. Nor did his differences with the Hospitallers and the Templars subside, but the orders essentially acted autonomously and on the whole they were quite cautious during this period. Finally, Bohemond managed to maintain very cordial relations with the pope, but Innocent IV was annoyed that he had given refuge to imperial fugitives from the Latin Kingdom, namely Lothair Filangieri and Thomas of Acerra. As a result of his rule, Antioch continued to decline in power and influence, but Tripoli, which was Bohemond's favored residence, remained relatively prosperous. Tripoli was saved from harm largely through the internal fighting among the Ayyubids.[284] It remains to be seen to what extent either Antioch or Tripoli were important factors in the artistic activities of the Crusader States between 1225 and the 1240s.

Finally, these years, 1225 to 1244, are remarkable in the history of the Crusader East because during this time we have three Crusades, each led by a very different personage, a full-scale civil war in the Latin Kingdom, the appearance of the Mongols and the Khwarismian Turks on the scene along with the Ayyubids and the Seljuks as Crusader adversaries, and the most intensive diplomatic interactions between the Crusaders and the Ayyubids during the existence of the Crusader States, leading to major truces with important territorial settlements involved.

In the case of the treaty discussions, it is also worth remembering that this signaled some major changes in regard to the way affairs were carried out in the Latin East, and especially in the Latin Kingdom. The Crusade movement had originally championed the cause of liberating the holy places and freeing the Christians in the East from Muslim oppression by force of arms. This the Crusaders had failed to do in 1227–9 and 1239–41, not to mention 1243–4. However, the Franks had managed to enter serious diplomatic negotiations with the Muslims over the disposition of Jerusalem and territory formerly part of the Latin Kingdom, repeatedly, much to the consternation of many in the West, most conspicuously the pope. Furthermore, the Crusaders had managed to win back control of the Holy City by this means, twice, in 1229 and in 1243. Moreover, whereas for the Third Crusade, the Fifth Crusade, or the Crusades of Thibaut of Champagne and Richard of Cornwall, the Christian armies in the field exclusively consisted of Frankish soldiers, it was remarkable that at La Forbie for the first time, a substantial part of the Crusader army was Muslim, marching under Crusader banners.[285] Apart from the consistently individualistic and often unpredictable views of Frederick II, these new developments represent a major shift in position and outlook by the resident Franks vis-à-vis the Muslims in the Latin East. When we examine the artistic activity in the Crusader States, we shall look with interest to see to what extent we can see any evidence for this shift in viewpoint reflected in the art produced for the resident and transient Crusaders during this period.

THE ART OF THE CRUSADERS, 1225–1244

This long narrative of the complicated history of the Latin Kingdom between 1225 and 1244 raises a number of issues related to the arts, including the following points:

1. There was an enormous amount of architectural work done in this period, but, as with the period of the Third Crusade and the following years, much of it involved the rebuilding of fortifications dismantled by the Muslims or as the result of treaties with the Muslims. How much Crusader architecture can be identified today as belonging to the work of this specific period as opposed to an earlier or later period? How can these identifications be made?

2. Members of the Ibelin family, especially Jean d'Ibelin, and the prominent imperial figures, including of course, Emperor Frederick II himself, are major players in the dramatic political and military events in the Crusader East during these years. To what extent can we identify these figures as patrons of the arts in the midst of their involvement with the turbulent events of these years in the Latin Kingdom?
3. Acre undergoes an important political change with the introduction of the commune in 1231 as a means by which the capital of the Latin Kingdom could maintain its independence, no matter who the *bailli* might turn out to be. What impact did the existence of the commune have on artistic activity in the capital city? Was the role of the confraternities enhanced as a potential patron for the arts at this time?
4. The Latin church struggled to deal with a number of challenges in this period. For example, there was its changing bases of economic support because the territorial configuration of the Latin Kingdom was altered constantly as a result of treaty after treaty in these years. There was also a number of conspicuous vacancies or, as with Gerold, patriarch of Jerusalem, absences, in major positions in the hierarchy when important decisions had to be made. There were in addition new developments that were changing the nature of the church in the Latin East. These included increased direct papal involvement with affairs in the Crusader church, the growth of the presence and activity of the new mendicant orders, and changing relationships with the Orthodox and other separated Christian churches in the Near East, that is, those who were inside jurisdictions of the Latin hierarchy. All of these aspects are relevant to the nature of artistic activity we find in the Crusader States at this time. What evidence do we see that artistic activity was affected by these changes?
5. It is evident that during this period the affairs of the Latin Kingdom were very closely intertwined politically, economically, ecclesiastically, militarily not only with the other Crusader States, but also especially with the kingdom of Cyprus. What impact does this new interaction with Cyprus have on the art of the Crusaders in the Holy Land, if any, as compared with that of the Latin Empire in Constantinople and Frankish Greece?
6. Finally, we see a dramatic increase in diplomatic activity between the Crusaders and the Muslims in this period. Do we also see evidence of greater awareness and influence of Muslim art and architecture as part of the results of these interactions?

We will find that in attempting to address these and other questions, compared to earlier periods, either 1210–25 or 1192–1210, there is, surprisingly perhaps, in some cases more evidence for artistic activity in this period, 1225–44, but there are nonetheless also some conspicuous gaps, strange voids in our knowledge. Once again in addition to the extant works themselves, we find that the written sources yield important information for our inquiry. Although it is true that the political unrest characterizing the years of the civil war in the Latin Kingdom cannot be seen to be particularly conducive for sustained artistic activity, we should not assume that artistic commissions were neither given nor carried out.

ARCHITECTURE: PILGRIMAGE SITES, PILGRIMS, CHURCHES, AND MILITARY FORTIFICATIONS

Compared to the period, 1210–25, it is odd that we have no detailed pilgrims' accounts for the Holy Land or the Holy City of Jerusalem for the years 1225–44, with perhaps one exception. This is a major lacuna in the written evidence we have for the period. Nonetheless, we know of a large number of prominent persons who went to the holy sites as pilgrims, many of them stimulated by the provisions of the Treaty of Jaffa in 1229, which opened the holy sites to Christian access. Also, we know from the written sources that there were major changes in the architectural fabric of the city of Jerusalem. The problem is that these changes do not receive any systematic discussion in the extant texts.

Jerusalem is, of course, the major site, and the text known as "L'Estat de la cité de Jerusalem" continues to be the focal descriptive text in this period. As we have seen,[286] the "Estat" exists as both a separate text and one imbedded in several historical accounts, including, for example, the text known now as "Ernoul-Bernard," written between 1229 and 1232 in the Latin East,[287] and the Rothelin Continuation, written in 1261 in France.[288] The introduction to the basic text of the "Estat" says:

> As most good Christians are glad to talk and hear about the holy city of Jerusalem and the holy places where Our Lord died and lived, we will tell you what it was like on the day Saladin and the Saracens took it from the Christians.[289]

Despite the fact that this introduction to the text is essentially the same in all the extant versions, placing the description of Jerusalem in 1187 before it was captured by Saladin, the later chronicles in which it is included were written when the situation of the Holy City was quite different. Thus it appears that the original text was prepared as a separate unit.[290] When this text is placed in a narrative chronicle, however, its location in the sequence of events is different in each case. For example, when the "Ernoul-Bernard" text was written between 1229 and 1232, the "Estat" portion was placed in the narrative sequence pertaining to the year 1187, that is, in its appropriate original chronological setting.[291]

When the Rothelin Continuation was written later in 1261, the location of the "Estat" text is changed to a narrative placement in the year 1229.[292] We can recall, of course, that the circumstances of the city in 1229–32 were quite distinct from those of 1187. For one thing, the walls of Jerusalem had been dismantled in 1219 by al-Mu'azzam, and secondly, access to the holy sites there had been newly arranged under the terms of the Treaty of Jaffa in 1229. So, in order to contextualize the "Estat" with regard to the current conditions of that year, 1229, an introductory chapter or "proto-preface," Chapter 1, is added. The "proto-preface" describes the setting:

> Great was the danger in which Frederick left the Christians of the Holy Land in Jerusalem, for the city was completely open and unprotected. The Saracens had demolished all the

> fortifications, except the Tower of David, while the Christians were besieging Damietta as we told you earlier.[293] Neither the emperor Frederick nor his deputy did anything to repair the city's defences. The Saracens in neighbouring towns saw this clearly, and one morning crowds of villanous Saracens gathered and entered Jerusalem, intending to kill the Christians.[294] The Christians defended themselves vigorously, killing more than 500 and losing only one man, an Englishman.[295]

The text of the "Estat de la cité de Jérusalem" then follows essentially unchanged from earlier versions in any significant content. As we noted in Chapter 2, there was only one instance where the basic description of the city before the conquest by Saladin had been revised in light of later developments, that is, the information about the accommodation of pilgrims during the time the Muslims controlled the city, after October 1187. This revision appears in all the extant versions of the "Estat," and it must have been done after 1187, but it could not have been done much later, probably in the 1190s. That insertion must have been the first revision to the "Estat" as it was used repeatedly for these continuations.

After the main text of the "Estat," the author of the Rothelin Continuation adds two further chapters: Chapter 10 addresses "Dou Pelerinaige de la Terre,"[296] and Chapter 11 "... des sainz Leuz de la Sainte Terre de Jerusalem." The content of Chapter 10 does not effectively introduce any new material, but rather presents an updated summary of interest to the pilgrim to the holy places in Jerusalem, focusing on the Church of the Holy Sepulcher, the *Templum Domini*, and the *Templum Salomonis*. In Chapter 11, there is a summary of the holy sites to be visited in the vicinity of Jerusalem, including Mount Sion, Gethsemane, the Mount of Olives, then Bethany, the Quarantaine, and Jericho to the east, and Bethlehem to the south.[297]

These two added chapters as found in the Rothelin Continuation (Paris, B.N. MS fr. 9083) are, however, not the same in content in all manuscripts. In the two additional chapters found in a series of manuscripts including, among others, Paris, B.N. MS fr. 24209, and Bern, Burgerbibliothek, MSS 41, 113, 115,[298] the text of the two additional chapters is more comprehensive, directed at sites elsewhere in the Holy Land rather than just in the Jerusalem area.[299] Although the preface to this part again suggests that the main focus is on the pilgrimages in the Holy Land in 1187, in fact the following text includes content that indicates revisions done much later.

Rothelin Chapter 10 now appears as "Des Pelerinages de la Sainte Terre, I," and Chapter 11 as "II" and "III" in these codices. In "I" there is a discussion of sites from Acre to Jerusalem, starting around, at, and near to Mount Carmel, then mention of sites at Chastel Pelerin, Caesarea, Arsur, Jaffa, Ascalon, Ramla, Betnuba, and Montjoie, or Neby Samwil. The second part of this text is a summary description of sites at Jerusalem and its environs, which is quite comparable in content to Rothelin Chapter 10, although the wording varies. In "II" we find descriptions of the sites in the general region around Acre, including Nazareth, Mount Tabor, Tiberias, Capharnaum, Safed,[300] and the Benedictine monastery of St. George between Safed and Acre. Finally there is an interesting section "III," which describes visits to Saidnaya, near Damascus, with its miraculous panel painting of the Virgin Mary, to Tortosa, where one can see "the first church erected in honor of the Mother of God," to Beirut with a miraculous image of Christ, and to Cairo, with its fountain of the Virgin Mary and the palm tree that bowed to her so she could pick one of its dates.[301]

It is evident from the content in these additional sections that the text was revised after 1187. Not only is the Templar castle at 'Atlit referred to, which dates from 1217–18, but also the relics of St. Euphemia, which, as we mentioned earlier, were displayed in the castle chapel sometime after 1218, but before 1231.[302] Based on this certain evidence, clearly the author of this additional material appears to have written it after *c.*1220. However, taking into consideration the numerous variations of this text, it is likely there were several revisions and more than one author involved; thus it is probable that the latest author(s) wrote after the Treaty of Jaffa in 1229, given the range of sites mentioned and the fresh summary dealing with the sites in and around Jerusalem.[303] It is unfortunate, however, that none of these accounts reflect the *realia* of Jerusalem's situation following the treaty of 1229 in any detail.

The one possible exception to the lack of a pilgrim's account of the Holy Land during this period is the curious verse text of Philippe Mousket,[304] a contemporary Flemish chronicler. His "Description des Saints-Lieux" is unusual for several reasons.[305] Written in the early 1240s, it is presented in verse, as part of a larger chronicle about the Near East. The sequence of his text is unusual, starting out with Old Testament biblical references that lead into a discussion of a chronological, that is, historically sequenced, presentation of holy events more than holy sites. The text starts with the house of the nativity of the Virgin Mary, the house of the Annunciation, and the place of the marriage of the Virgin to Joseph. The problem is, however, that some of these sites are completely fantastic. For example, he claims the Virgin Mary was born in Egypt, without saying exactly where, and despite the extended discussion about the marriage, Nazareth is never mentioned by name.[306] This part is followed by a long discussion of Bethlehem, which actually refers to the Church of the Nativity briefly, but focuses on the story of Christ's birth and the visit of the three kings. Continuing on to Jerusalem, the sites are mentioned in the following order: the *Templum Domini*, and the piscina probatica on the north side of the Haram, then Bethphage, Bethany and the upper room of the Last Supper. Obviously this begins a sequence pertaining to the Passion of Christ, followed by Gethsemane, the house of Pilate, the house of Caiphas, the hill of Calvary, and the Holy Sepulcher. From there, the sequence moves to the Church of St. Mary Latin, the Mount of Olives, and the Valley of Jehosaphat, then on to Jericho and the Jordan River. The description concludes with reference to Sinai, Mount Tabor, Lake Galilee, the miraculous icon at Saidnaya, then finally back to Mount Sion, Hebron, and St. Abraham.

It is evident when reading this description that the text deals overwhelmingly with the literary stories of what happened at these sites, the lore of these places for a Christian visitor, much more than with details of the physical reality of what could be seen. Not only the locations referred to, but also sometimes the sequence and content of the descriptions are often quite unpredictable. Therefore, we must conclude that in contrast to the author of the text of "L'Estat de la Cité de Jérusalem," Philippe Mousket's rhymed verses do not seem to reflect a personal knowledge of the Holy Land based on a firsthand visit. The existence of a literary confection like this, however, is perhaps a strong indication of both the still strong desire many people had to make a pilgrimage to the holy places and the difficulty that pilgrims had to face when attempting such travel, even in times of truce between the Latin Kingdom and the Muslims.

One final aspect of this text that is noteworthy pertains to the major sites besides Jerusalem, Bethlehem, and Nazareth. We have noted earlier in our discussion that when these primary holy sites were removed from direct access to Christian pilgrims in 1187, other holy places began to become important in the thirteenth century. It is interesting to see that in Philippe Mousket's text, neither Tortosa nor Chastel Pelerin at 'Atlit are mentioned inside the Crusader States, but both St. Catherine's Monastery on Mount Sinai and the miraculous image of the Virgin at Saidnaya, north of Damascus, are included. These references accord with what we found in the earlier texts of Wilbrand of Oldenburg and Magister Thietmar.[307] They indicate that these sites were very much part of the major agenda for a Christian pilgrim to the Holy Land during this period, even though they were far outside the borders of the Latin Kingdom.

Despite the lack of pilgrims' accounts in this period, however, there certainly were a number of important pilgrims to Jerusalem, whom we know by name. This indicates that during the major Crusades of 1228–9 and 1239–41, and in periods after the Treaty of Jaffa in 1229 up to the fall of Jerusalem in August of 1244, there were times when numerous pilgrims came to the holy places. This occurred despite the continuing dangers along the routes in and out of the interior of the country. Among the most important pilgrims whom we can identify are the following. In March 1229, Frederick II was accompanied by certain Sicilian bishops, members of the Teutonic Order, and two prominent English bishops, Peter of Winchester and William of Exeter. As we know, Frederick went to the Church of the Holy Sepulcher and wore his crown there as Holy Roman Emperor on 18 March 1229. His visit also included a tour of the Haram al-Sharif, during which time he made various peculiar comments about Christianity, treated certain Christians he met strangely, and expressed open admiration for Islam, all of which was duly recorded in the Muslim chronicles.[308]

As for the two English bishops, William of Exeter made his pilgrimage to Jerusalem to fulfill a personal vow, one that his uncle, William Brewer, had left unfulfilled in 1189.[309] He had also been authorized to spend 4,000 silver marks, which the Templars had on account for his uncle in Acre. Peter des Roches was an even more important figure who, as bishop of Winchester, had personally crowned Henry III king of England and served as the guardian of his person from 1216 to 27. It was also he who had organized the preaching of the Crusade in England as directed by the pope.[310] He was extremely powerful and wealthy and used his resources for the benefit of the Crusades. Tyerman comments, "the bishops' money was their chief service."[311] Unfortunately, however, we know virtually nothing specific about their pilgrimages to Jerusalem in terms of any details about their activities or any account they wrote of their visit.

Both bishops arrived back home, however, far from empty-handed. Besides his pilgrimage to Jerusalem, William of Exeter is said to have been involved in the negotiations between Frederick II and al-Kamil, and to have visited Damascus and Baghdad. When he came home to England in 1229, he is said to have brought costly embroideries.[312] It is not known what, if anything, he brought from the Holy City. Peter des Roches, meanwhile, also returned with precious objects. He is reported to have brought back a manuscript of an apparently now lost work of William of Tyre, his *Historia Orientalium Principum*, as a gift to Matthew Paris.[313] He also is said to have had a cross from the Valley of Jehosaphat and a relic of the foot of St. Philip, the latter which he gave to the monks of St. Swithun's, Winchester.[314] Again it is not certain whether any of these objects might have originated in Jerusalem.

Among the later-known prominent figures who made pilgrimages to Jerusalem, we have Thibaut de Champagne and Pierre de Dreux in 1240. The Rothelin Continuation reports that at the end of his Crusade, after he had made a treaty with the sultan of Egypt, about the beginning of September 1240, "[Thibaut] the king of Navarre went off with many of his people to Jerusalem, to Our Lord's Holy Sepulcher and the other holy places there."[315] On the same Crusade was the bishop of Marseilles, Benedict of Alignan, who persuaded the Templars to build Safed in 1240, and then returned to the Holy Land in 1260 to see the results of their labors. He also went on pilgrimage during his visit, again after the treaty mentioned earlier, but the surprising thing is where he went. The treatise, *De constructione castri saphet*, written about the castle and Benedict's role in the project, records the following information:

> When a truce was made with the Sultan of Damascus, the king [Thibaut de Champagne] and the great army returned to their country. The bishop of Marseilles, in fact and in name Benedictus, went to St. Mary of Saidnaya on pilgrimage with the Sultan's permission.[316]

This text does not state whether Bishop Benedict made a pilgrimage to Jerusalem with Thibaut and the others of his army. We may imagine that in all probability he did, despite the omission. However, it is again notable, but not surprising, that the bishop took this opportunity to go on pilgrimage to worship the miraculous icon of the Virgin at Saidnaya. It is another affirmation of the importance of this site for Christian pilgrims in the thirteenth century. It is also an indication that travel into Muslim territory in Syria was possible, that it may indeed have been no more dangerous than the trip from Jaffa via Ramla and Lydda across the shephela and up into the hills to Jerusalem, and that the sultan of Damascus was willing and able to have Christian visitors. Based on the text of the *De constructione castri Saphet*, it appears that, for one thing, the permission was simply a mechanism that had come into being during the time the holy sites of Jerusalem and Bethlehem had been under Muslim control, that is, 1187–1229, and for another, having Christian pilgrims was a source of information for the Muslims about what the Crusaders were doing. What we do not find in the text is any direct reference to the evident fact that the pilgrimage was also a source of revenue to the Muslims from the fees paid to gain access.

We read in the text:

> While he [Bishop Benedict] was waiting for some days in Damascus as commanded by the Sultan, many people frequently inquired of him if Saphet was to be rebuilt. When he

> asked them why they inquired so insistently, they answered that with the building of the castle of Saphet, the gates of Damascus would be closed.[317]

Richard, earl of Cornwall, was the brother of King Henry III, and he was reputed to be the wealthiest man in England. When he arrived in the Holy Land following the departure of Thibaut de Champagne, he put his financial resources at the service of the Crusade, by taking any Crusader in need into his pay, and by completing the rebuilding of Ascalon.[318] Then, "after that they made their pilgrimage to the holy city of Jerusalem and to all the other holy places in the land of Outremer that they could go."[319] We do not know the details, but the pattern of these prominent figures going on pilgrimage to Jerusalem and other holy sites had clearly been reestablished as an essential part of every Crusader's visit to the Holy Land, not only in principle but also now in reality. Obviously, Richard may also have acquired relics and precious objects during his pilgrimage to take back to England with him.[320]

One of the last major figures to visit Jerusalem before the Khwarismian attack in August was the new patriarch of Jerusalem, Robert of Nantes. When he arrived in the Latin Kingdom to take up his new position, Robert went first on pilgrimage to Jerusalem as stated in a letter of William of Chateauneuf, grand master of the Hospitallers:

> [When] the patriarch of Jerusalem landed from the transmarine provinces; and, after taking some slight bodily rest, he was inspired with a longing to visit the sepulchre of our Lord, and set out on that pilgrimage, in which we also accompanied him.[321]

This pilgrimage also turned into a war council with the masters of the Hospitallers and the Templars to plan the defense of Jerusalem in the face of the Khwarismian invasion, which had begun in the north. Although he had intended to reestablish his residence as patriarch in the Holy City, after the planning session, Robert was forced to seek safety in Acre in the face of the military danger looming on the horizon. Before he left the Holy Land, however, he apparently did have time to acquire certain relics – most likely in Acre – which he took to England in 1246 in order to attempt to recruit King Henry III to take the Cross.[322]

When Jerusalem fell in August of 1244, this again put a major obstacle in the way of access for Christian pilgrims. Also the Holy Sepulcher had been damaged during the sack of the Holy City. The pilgrimage to Jerusalem during the thirteenth century was clearly most important between 1229 and 1244, that is, during the time the Crusaders held Jerusalem by treaty, either in part from 1229 to 1243, or, as in 1243–4, as a whole. It is all the more curious in light of this fact and in view of the numerous prominent pilgrims who came to Jerusalem that we have no major new pilgrim's accounts from this time, except for the examples discussed.

What written evidence we have, in the "Estat de la cité de Jérusalem," in the chronicles, or otherwise, makes clear that very little architectural work was carried out on the holy sites of Jerusalem, Bethlehem, and Nazareth. No major work is known from any of these sites between 1225 and 1244. Although we can probably assume routine maintenance for these sites during the time there was Christian access to the holy sites by treaty, 1229–44, important new ecclesiastical construction was underway elsewhere inside the current borders of the Latin Kingdom and the County of Tripoli. We find new church construction at Tortosa and at Chastel Pelerin, or in castle chapels as part of major new fortifications such as at Montfort and Safed. Furthermore, a serious question arises in regard to regular repair and maintenance of the holy sites in Jerusalem following the depredations of the Khwarismians in 1244 as reported in the texts.

The Cathedral Church of Notre Dame of Tortosa (Figs. 84–87)

The Cathedral Church of Notre Dame at Tortosa was the largest and most important extant ecclesiastical project underway in the first half of the thirteenth century not related to a castle project or a new town.[323] There are no precise documents to date the completion of the church, which had been damaged by the earthquake of 1202 and then repaired immediately. Received opinion states that whereas certain work was done about 1200, the western end of the building was only completed in the mid-thirteenth century.[324] It appears that Deschamps, in expressing that opinion, is, like Enlart, thinking of the period when Louis IX was resident in the Holy Land, that is, 1250–4, for the completion of work on this important monument.[325] We must, however, question this hypothesis based on the historical and art historical evidence.

In Joinville's biography of St. Louis, he does not mention that the king made a visit to Tartus. Although it is true that Joinville himself, Louis's chronicler, does make a pilgrimage there, he has nothing to say about the state of the church at that time, which, in our view, must have been excellent and complete. Much of our historical interpretation is therefore based on the financial condition of the episcopal see of Tartus. In the

first place, we know that the bishop of Tartus had arranged tithes for his church from the Templars of the city since the twelfth century and payments from the Hospitallers by 1215. Secondly, the shrine of the Holy Virgin, as a major holy site in the Crusader States, attracted gifts and contributions from its visitors, the more so in the thirteenth century because of its newly important status.[326] Because of this steady income and the sound management that the bishops of Tortosa were able to exercise all through the thirteenth century, it seems probable that construction on the church would have most likely been carried on gradually and more or less continuously until it was finished.

Given the fact that the church was basically in good condition for all we know by *c.*1210, after repairs following the earthquake of 1202, it was basically only the west end that required new construction to finish the structure. Furthermore, the major work to be done was essentially routine, matters of completing the western bays and the west façade with its portal, lancet windows, and towers. One observes nothing particularly innovative in design or structure. Therefore I see no reason to imagine that the completion of the construction would have been delayed forty-some years until Louis IX arrived. Certainly we have no explicit indication that Louis IX played any specific role as a patron of construction at Tortosa, in contrast to his known activities at Acre, Jaffa, Caesarea, or Sidon. Furthermore, Tortosa Cathedral enjoyed a lively new importance in the Crusader States due to its venerable pilgrimage site following the loss of Jerusalem in 1187, long before Louis IX arrived in the Holy Land. The growing numbers of pilgrims who included the shrine of the Holy Virgin at Tortosa in their agenda of holy sites in the first half of the thirteenth century indicate this newly enhanced status, as we have seen with Wilbrand of Oldenburg, among others.[327] Finally, Tortosa was basically open and easily accessible to Christian pilgrims in a coastal site controlled by the Crusaders, whereas Jerusalem, Bethlehem, and Nazareth were much more difficult to visit inland in the years before 1229, as the accounts of both Wilbrand and Thietmar indicate.[328] Therefore, it seems likely that the cathedral church would have been completed with all deliberate speed, political, military, economic, and ecclesiastical conditions permitting. In light of these considerations, I propose that the church was indeed essentially finished by the late 1220s with exception of its fortifications, which came later. Consider the following particulars.

As both Enlart and Deschamps have indicated, there is nothing particularly progressive about the basic architectural characteristics of the cathedral church of Tortosa outside of the shrine pier complex.[329] The base mouldings and the vaulting are the same throughout the church, demonstrating a fundamental unity of design and a conservatism that gives the interior a striking harmony,[330] although it is a church started in the mid-twelfth century (1152–87) and probably completed by the late 1220s. The major indications of the new Gothic style are to be found in the carving of the latest architectural sculpture or the shapes of certain architectural forms. We see these in foliate capitals, in the design of the arched openings of the west end of the church, and in the details of the figural and nonfigural decoration. Enlart proposes that we can find only in the architectural sculpture a clear development that permits us to date different parts of the building.[331] This statement reveals that whereas the church in design and structure is basically a sophisticated example of the Crusader levantine Romanesque, its three phases of construction are most clearly indicated by the architectural sculpture seen primarily in the foliate decorations of capitals and bosses. The question is, "what dates are to be assigned to these three phases?"

We have argued previously that Crusader church building, as with all Crusader architecture, must be seen as an independent development to be analyzed and evaluated on its own terms. The record shows in the twelfth century that most of the churches erected in the Crusader States had little direct connection with the European West, in terms of precise dating or specific design.[332] In the thirteenth century, the political, economic, ecclesiastical, and cultural situation obviously changes dramatically, so we must reconsider our hypothesis under these new conditions.

In order to assess the dates of the architectural sculpture on the Cathedral Church of Notre Dame at Tortosa, we must challenge a heretofore fundamental but largely unspoken concept in regard to Crusader architecture in the Latin Kingdom during the thirteenth century. The idea of waiting for Louis IX to arrive as an impulse for restarting the construction of Crusader architecture, whether considered specifically for the case at Tortosa, or more generally in the Crusader States, is to assume, first, a false premise that Crusader architectural activity had tailed off, or even stopped somehow between the time of the Third Crusade and the arrival of King Louis. Nothing could be further from the truth. The extent of Crusader building activity in the period 1225–44, as previously – as we have seen – was extensive. This is true even if the visible results of this construction are known primarily to have been carried out in military fortification, and despite the fact that very little of the work done in this precise period is accessible to us today because it has been incorporated into other work, rebuilt later by the Crusaders or even the Muslims, or destroyed!

Second, simply stated, this unspoken notion basically attributes the advent of any form of refined Gothic style in the Crusader States to the period in which King Louis IX of France was resident in the Holy Land, in 1250–4. Although it is true that Louis IX was extremely active in the Latin Kingdom during his residence, as we shall see, sponsoring the rebuilding of many important fortifications at Acre, Jaffa, Caesarea, and Sidon, some of which include extant architectural sculpture, he is not associated with the important Gothic developments at Crac des Chevaliers, and he is not particularly associated with the architecture of any major churches in the Latin East at this time. Furthermore, it should be kept in mind that Louis was not exceptional in what he did in terms of his patronage. Other Crusade leaders had, after all, preceded him in rebuilding the old or building new fortifications – men such as Richard I, Leopold of Austria, Walter of Avesnes, Thibaut de Champagne, and Richard of Cornwall. What *was* exceptional, of course, was the great length of time Louis spent in the Holy Land, the remarkable energy and dedication he gave to the cause, and the vast resources he expended while he was there.

Furthermore, there is certainly nothing built in the Holy Land by the Crusaders extant today that resembles the court school Gothic in Paris that Louis IX actively commissioned in the 1240s with the erection of the Sainte-Chapelle in Paris, before he left France to come on Crusade.[333] In fact, although we can find Gothic architecture and Gothic architectural sculpture in the Crusader States, and although these developments represent to some extent an export of Gothic from France to the Holy Land, we do not find anything resembling the phases of Gothic found in France *c.*1190–1250 and transported to the Holy Land. There is no high Gothic phase, no court school, no rayonnant in the Latin Kingdom visible from the extant monuments, only Gothic buildings with reflections of some – really only a few – of the characteristics seen in those developments in France. Moreover, it is evident that those Gothic churches in the Latin East that most closely resemble French Gothic in design, structure, and architectural sculpture, such as the cathedrals of the Holy Wisdom in Nicosia or St. Nicholas in Famagusta, are on Cyprus. The latter was done *c.*1300–*c.*1320 and closely resembles high Gothic work done nearly a hundred years earlier at Reims along with later work at St. Urbain at Troyes.[334] The former was begun in the early thirteenth century, and its main construction, including the choir and transepts, was carried out under Archbishop Eustorgue de Montaigu between 1217 and 1250. That means the basic Gothic design in the Church of the Holy Wisdom was conceived and executed long before Louis IX arrived. Even the nave, which was damaged by an earthquake in 1270, was only completed, along with the west façade, long after Louis had gone home, in the early fourteenth century.[335]

When did Gothic architectural style first enter the Crusader States as a direct import from France? We have already argued, based on the research of N. Kenaan-Kedar, that the first church in the Latin Kingdom to show clear links to early French Gothic was the Cathedral of St. John at Sebaste.[336] Thus we have an example of a Crusader church at Sebaste built between 1168 and 1179 that reflects aspects of the new Gothic architecture from the Cathedral of Sens in the 1140s, thirty-some years earlier. The Sebaste–Sens link is based on explicit documentation that N. Kenaan-Kedar has presented convincingly. This case is a rare example where such a direct connection can be made, but it demonstrates some important points about Gothic in the Crusader East. First, Gothic architecture appeared in the Holy Land in the twelfth century before 1187. Second, although the cathedral at Sebaste is closely linked to Sens, the particulars of its architecture are independent according to the needs of the local holy site, and its date shows a significant gap between the time the original church was begun at Sens and the time that the Cathedral of Sebaste was constructed. Third, even though there may, on occasion, be direct links between Gothic architecture in France and Gothic churches in the Crusader States, every case must be considered on its own merits, in order to assess what the documented linkage may be and how the Crusader church is related to its putative antecedents in the West in both date and style.

Was the Sebaste example a *unicum*, an anomaly in which Gothic architecture appeared in the Holy Land in unique circumstances in the twelfth century? That does not seem to be the case. Two other examples of Gothic exist in the Latin Kingdom. Not only do we have certain new Gothic architectural elements that appear at the Church of the Holy Sepulcher in Jerusalem in the 1140s and 1150s,[337] but also we find the holy site of the *Coenaculum* in the Church of St. Mary Mount Sion in Jerusalem displays Gothic characteristics in the years prior to 1187.[338] In fact, the early Gothic style found in the Cenacle is quite developed and demonstrates that even if the Holy Land was far from the origins of Gothic architecture in France, the Austin canons were able to commission a structure with quite up-to-date Gothic style for this holy site in Jerusalem before 1187! Just as those examples of Gothic architecture must be analyzed and interpreted individually, so too we must carefully reconsider Tortosa.

What is the situation at Tortosa?[339] Let us review the analysis given to the Cathedral Church of Our Lady at Tortosa by C. Enlart.[340] The church is large, over 45 meters long and 30 meters wide, consisting of a rectangular triapsidal east end with a tiny choir, and four squarish bays to the west. It has two large rectangular towers, unequal in size, on the exterior east end. Pringle identifies these as rectangular tower-like sacristies.

A single polygonal bell tower on the northwest corner of the west façade, apparently built when the west façade was completed. A tower on the southwest corner was apparently intended but never constructed. The church is located near the city walls and its heavy wall appearance is partly due to its defensive function, for which its walls were apparently reinforced in the thirteenth century. Pringle says that these buttresses probably once supported machicolations. To the north side of the church were located a cloister and the episcopal palace.[341]

The masonry of this church is extremely carefully done, with a number of masons marks visible. The stone, called "pierre *maleki*" by Enlart, is analogous to travertine, very hard, but which weathers with deep cavities and ruptures. The stone, quarried from a site northwest of the town, was creamy in color and carefully chosen for the early phase of the church in the second half of the twelfth century. The stone used for the thirteenth-century phases, apparently a similar stone but from a different location, often has a more russet color and a coarser grain.[342]

Enlart mentions in passing that the plan of the church is not without analogies to Early Christian basilicas in this region of Syria, but he attributes its definitive originality to the special enlarged and pierced pier on the north side of the nave, between the second and third bays. This is the place of the pilgrimage shrine to the Virgin. For this he finds earlier parallels in both the Church of St. Maurice in Vienne and a church in Merlande in the Dordogne. The east end has parallels with other Crusader churches, at Gibelet, at Beirut,[343] and with the Armenian Church of St. James in Jerusalem.[344] The west end is the most recent, with the two western bays slightly larger in size and with more light, mainly from the windows in the west façade.[345]

On the exterior, Enlart compares its appearance to the Church of Saint-Victor in Marseilles.[346] There are buttresses along the north and south walls, very thick and projecting. Buttresses for the aisles are horizontal at the top; those for the nave have taluses, as found at the Church of St. John in Beirut. The west façade wall is planar, without buttresses, as is found at the Church of St. John in Sebaste and on the Church of St. André in Acre.[347]

The nave has a pointed-arch barrel vault, with heavy transverse arches of double voussoirs. The aisles are groin-vaulted, with similar double transverse arches. The groin vaults rise to the level of the imposts for the springing of the transverse arches of the nave. All of the arches and windows are constructed with Gothic "arc brisé" design, except the small rectangular windows in the clerestory of the nave mentioned later. The piers of the nave are cruciform, with engaged columns on wall reveals. The pilasters that receive the vaults of the aisles are composed of a dosseret with an engaged column. In the third bay of the north aisle, the column and dosseret are corbeled at the bottom.[348]

The windows of the apses are larger than those in the aisles, and placed without an ornamental border. The aisle windows have a handsome ornamental frame. The nave has no windows in its eastern part. In the later thirteenth-century bays at the west end, the nave has rectangular windows that directly pierce the vault in the first and second bays. There are also small side portals: in the first bay on the north side and in the second bay on the south side. These portals have undecorated exposed masonry tympana; on the north the tympanum sits on a pedimental lintel with corbels above the jambs, and on the south the lintel is more or less rectangular without corbels above the jambs.[349]

The groin vaults of the western bays, on the north and on the south, all date to the thirteenth century. We recognize this from the use of the carved bosses that decorate their keystones. The procedure seems to have been that when the nave was extended by two bays in the thirteenth century, the groin vaults were added in the aisles. The Romanesque program of the architecture was thereby maintained, but capitals were added in the new Gothic, thirteenth-century style.[350] On the exterior, the walls of the last bay on the south and the last two bays on the north also date to the thirteenth century.

For the all-important architectural sculpture, there are primarily the capitals, which are found on every pier, the bosses in the western aisle bays, and the few bits of figural decoration: on the northeast apse interior and on the west facade. The capitals in principle are contemporary with the piers, except for the triumphal arch over the altar, which has ancient Roman capitals. The molding profiles are the same for the abaci, the framing components, and the string courses in the twelfth- and thirteenth-century phases of the church.

The pierced shrine pier has the most varied capital sculpture (Fig. 86). For this pivotal work in the nave, Enlart proposes a date in the early thirteenth century, presumably rebuilt after the earthquake of 1202.[351] Enlart identifes the earliest work on this pier on a capital with geometrically conceived foliate carving.[352] He calls this work "une oeuvre de transition," executed in a "style gothique primitif," which he compares with capitals on the south wall of the nave at Noyon Cathedral.[353] This section of the nave at Noyon is dated to the period *c.*1170–85 for the first double bay, and to *c.*1185–1205, for the rest of the nave.[354] We can also see the same simplicity in the somewhat different nave capitals of Laon Cathedral. In contrast to this capital, he proposes a varied series of capitals in the eastern bays of the nave and north aisle, which he calls Romanesque in style.[355] These he compares with capital sculpture from the nave of the cathedral at Le Mans (*c.*1145–58).[356] This sculpture obviously belongs with the earliest phase of the cathedral at Tortosa, that is, 1152–87.

The more fully developed Gothic sculpture at Tortosa Cathedral is found on the upper part of the pierced shrine pier and in the western bays of the nave and side aisles (Figs. 86, 87). Enlart sees these Gothic capitals fully as varied and diverse as the earlier Romanesque examples. The problem is he interprets these capitals as datable to the early thirteenth century on the one hand, and to the mid- or later thirteenth century on the other.[357] If we look at the Gothic capitals from the upper level of the pierced shrine pier,[358] these carvings appear to reflect a slightly more developed version of the early Gothic capital, as seen in the nave of Noyon (1170–85), cited earlier, or the capitals on the entrance to the south transept chapel at Soissons (1177–80).[359] The later versions of this capital type from the western bays of the Tortosa Cathedral are clearly even more developed, with more plastically modeled leaves, more naturalistically rendered floral buds, and more nuanced leafy foliage.[360] They might be compared in their development to the capitals on the piers in the main nave of Chartres Cathedral done after the fire of 1194.[361] More to the point in the Latin Kingdom, however, they can be compared to the slightly earlier capitals found in the *Coenaculum* from the years just before 1187.[362] They are in any case, I submit, developmentally continuous with, and chronologically close to, the earlier versions found in Tortosa, not separated by a gap of over forty years. They are arguably datable in the Cathedral of Tortosa to the period of construction after 1202, following the rebuilding of the shrine of the Virgin and the repair of the church. I am proposing that the final phase of work, during which Tortosa Cathedral was completed, took place in the late teens and the 1220s.

Enlart, of course, dates what he takes to be the latest work in the decorative architectural sculpture to the 1250s or the second half of the thirteenth century, the period during or after the residency of Louis IX in the Holy Land. He finds the latest capitals at Tortosa comparable to those in Reims Cathedral.[363] The fact is, however, that there is nothing at Tortosa that approaches the remarkable naturalism, the extraordinary complexity, or the lush density of even the earlier foliate work in the nave at Reims (1211–41). Nor is there anything at Tortosa comparable to the similarly impressive naturalistic foliate capital carving at the Sainte Chapelle,[364] which conceiveably should be even more relevant, if Tortosa was completed in the 1250s, nearly ten years after Louis commissioned his palatine chapel.

The other decorative sculpture on the church at Tortosa, namely, the carved bosses on the keystones in the western bays of the side aisles, or the few examples of figural sculpture offer no evidence that would change this proposed dating. The floral boss motifs are nicely done, but they are very controlled and geometric in style. They would certainly not seem to be as late as the more complex and elaborate examples executed for the castle at Montfort between 1229 and *c.*1240.[365] The scarce and fragmentary figural sculpture is found on the interior, on fragments from the north apse *cul-du-four* wall, and some tiny heads – now defaced by the Muslims – remain above the foliage of certain capitals. On the exterior, there is an animal adjoining one of the colonnettes by the windows. The fragment of a dove is the best-preserved interior fragment. Although decapitated now, his wings are displayed: it is perhaps a dove of the Holy Spirit. Other fragments of this group include a winged figure that suggests possibly a group of the four Evangelist symbols, with the dove. Enlart also reports on part of a lamb, but it is not illustrated. The animal on the exterior façade is a tiny jackal, quite handsomely rendered,[366] the kind that, as Boase remarked, on "an evening come close to the towns and villages of Syria."[367]

The west façade of the church (Fig. 84) was done entirely in the thirteenth century in a harmonious design with triple fenestration over the main portal announcing and lighting the nave, single windows at an intermediate level indicating and lighting the side aisles. On the exterior, the hood moldings of the central windows have splayed voussoirs with six *bandeaux*; those of the side windows have four, all done in the same stone as the wall. The main portal, clearly restored in the twentieth century,[368] has – in its current configuration – a hood molding, with plain splayed voussoirs and jambs with two colonnettes on each side.[369] On the interior, the voussoirs and moldings of the windows were done in marble, now mostly robbed out. Enlart compares the design and materials to the Crusader churches at Gaza and Ramla, as well as the now destroyed Church of St. André in Acre.[370] He also presumes that although there is no cornice for the façade extant, there was originally a *chaperon* or hood molding over the central bay, perhaps surmounted with a crucifix.

In sum, there can be no doubt that the thirteenth-century Crusader foliate and figural sculpture at the Cathedral of Tortosa is handsomely done by well-trained masons. The fact is, however, there is no sculpture unmistakably mid-thirteenth century in style by French or Crusader criteria that indicates a date in the 1250s rather than the 1220s. Whereas there are carvings of floral, foliate, or animal designs of striking naturalism on the bosses of the vaults,[371] certain capitals,[372] and on one window colonnette capital of the west façade,[373] none of this requires a date so late as the 1250s. The varieties of Gothic style employed at Tortosa on the cathedral church are unconnected in any rational way with the advent of King Louis IX. We see no parallels with work he sponsored elsewhere in the Holy Land; the fleshy foliate sculpture in the gatehouse work at Caesarea has little to do with the more refined work at Tortosa.[374] Nor do we see any links at Tortosa with the more refined Gothic style from the court school in Paris, seen in the work he commissioned for the Sainte Chapelle. Finally, in terms of Gothic architectural sculpture in the Latin Kingdom, the work at Tortosa seems clearly to post-date the precocious work at the *Coenaculum* by 1187 in Jerusalem and to precede the important Gothic sculpture in the loggia and great hall at the Hospitaller Castle of Crac des Chevaliers *c.*1250.[375]

Methodologically also, it is problematic to base an interpretation of the dating of a work of architecture solely on the basis of the decorative sculpture on the building, without some kind of corroborative evidence. We know that there were major interruptions at Tortosa when Saladin invaded the Holy Land in 1187–8, and when the serious earthquake of 1202 hit Syria-Palestine. Enlart offers no archeological or historical evidence to document that there was a major interruption in the construction during the years after 1202. Given the prosperous circumstances of this episcopal see, given the increasing flow of pilgrims coming to this holy site in the early thirteenth century, given the evidence of the architectural sculpture itself, seen not only in terms of its own internal development, but also in relation to stylistic developments in France, with a certain time lag that tends to diminish as work goes on into the second and third decades of the thirteenth century, I propose that we should regard the Cathedral of Tortosa as the foremost Crusader church to be essentially completed in the 1220s, with the exception of its unusual fortification.

The final phase of construction on this church basically had nothing to do with the Gothic character of the building. When the church was effectively done it appears that somewhat later, perhaps in the 1260s when this region was repeatedly threatened by Mamluk incursions, major efforts were made to strengthen its walls and towers. R. D. Pringle comments on this as follows: "a pair of rectangular tower-like sacristies which project from the north-east and south-east corners of the building were evidently intended to provide flanking cover, and the buttresses attached to the north and south walls probably once supported machicolations serving the same purpose (as on the late thirteenth-century church of Saintes Maries-de-la-Mer in the Camargue). Camille Enlart also found evidence for a pair of towers over the western aisle bays. This transformation of the church into a small castle appears to date to the 1260s."[376]

Churches in the City of Acre (Map 8A)

Other churches in the Latin Kingdom raise similar issues because of similar circumstances, as we shall see. One of our biggest problems in dealing with Crusader ecclesiastical architecture in the first half of the thirteenth century, however, is caused by the enormous destruction in Acre in 1291 and later. That is to say, we have lost an enormous corpus of *comparanda* and are forced constantly to be looking at artificially isolated examples among the extant monuments. Consider the following list of churches mentioned by Enlart and known to have existed in Acre during the thirteenth century based on historical maps and references in the written sources.[377] This list, of course, is a point of departure for modern scholarship, which has been subject to change as our knowledge of Crusader Acre grows. Vigorous archaeological work in recent years has yielded valuable information, and it goes without saying that this census of known churches and convents in Acre will be completely revised when the current research of R. D. Pringle is published, in – we hope – the very near future.[378] Until that time we follow Enlart's published presentation here as a means of beginning the discussion:

1. The Cathedral of the Holy Cross, probably built in the twelfth century; the confraternity of St. Andrew in Acre probably met in a chapel of the cathedral.[379]
2. The patriarchal church of St. Mary Latin was built after 1191; it was adjacent to the patriarchal residence.[380]
3. The parish church of St. Andrew, which was the largest church in Acre, was also a major landmark because it was located along the seawalls between the Templar headquarters and the harbor. It probably belonged to the confraternity of St. Andrew, and may have been built in the 1240s at the time that the commune ceased to exist. Enlart calls it a very large and beautiful church from the time of St. Louis,[381] but like the cathedral in Tortosa, it may very well predate Louis's coming.
4. The parish church of St. Michael, mentioned in 1200 as a parish, was located in the northwest part of the city near the *Bouverel* and the sea gate of St. Michael.[382]
5. The Templar church was located in the Templar headquarters on the southwest point of the city, along the seawalls.[383]
6. The church of St. John was the conventual church located adjacent to the Hospitaller headquarters. It is shown as south of the headquarters in the maps of Marino Sanudo and Paolinus of Pozzuoli.[384] See now the location of this church as confirmed by recent (2003) excavations (Map 8B).
7. The Church of the Teutonic Knights was located in the northeast section of the city, near the Tower of the Germans.[385] We can recall that the Teutonic Order was founded here in Acre following the Third Crusade.

There were a large number of religious orders with churches in the main part of the city of Acre.

8. The Benedictines had a monastery named St. Mary of Jehosaphat, in honor of their house in Jerusalem.[386]
9. The regular canons of St. Augustine were installed in the Cathedral of the Holy Cross when they transferred from Jerusalem, but they apparently also had a church of their own, named Holy Savior.[387]
10. The Premonstratensians had a church in Acre named St. Samuel, the same name as their church outside Jerusalem.[388]
11. The Dominicans had their church and house along the seawall between St. Michael's and the Templar headquarters.[389]

The Franciscan church in Acre was located in Montmusard, for which see the list of churches in Montmusard that follows.

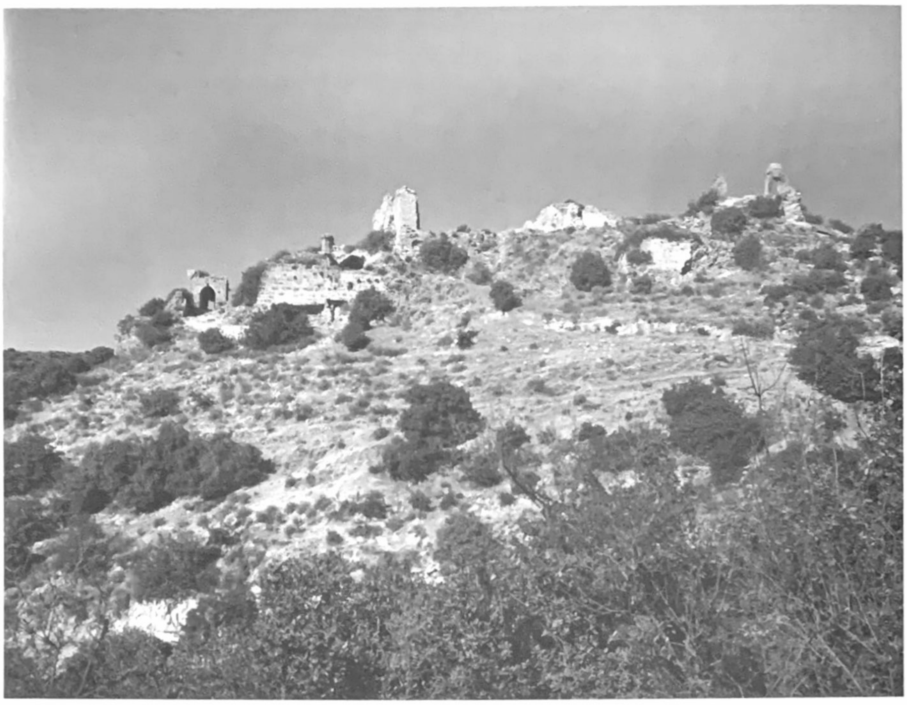
Each of the quarters controlled by one of the maritime powers had its own church in the city.

12. The Pisan Church of St. Peter was located near the southern tip of the city near the harbor.[390]
13. The Genoese Church of St. Lawrence, which has a modern church built on its medieval foundations, is located in the Genoese quarter south of the *Bouverel*.[391]
14. The Venetian Church of St. Mark was apparently located along the harbor, east of the Venetian fondaco.[392]
15. The Church and Convent of St. Sabas was located on a small rise in the town, between the Genoese and the Venetian quarters.[393]

There were also churches built for the Amalfitani, the Provençals, and the Anconitans in the thirteenth century, but the location of these churches is not known for certain. In addition there were convents for many orders of nuns: Augustinian nuns, nuns of the Magdalene who followed the Cistercian rule, the Franciscan Poor Clares, sisters of St. John, the nuns of St. Lazare, the nuns of St. Anne, the Convent of St. Brigitte, and the Convent of Notre Dame of Tyre, among others, most of which were inside the old city walls.[394] Quite possibly there was a convent of the sisters of the Knights of St. John of the Hospital of Jerusalem in Acre, although Enlart does not discuss this.[395]

The growing suburb of Montmusard had a large number of churches including some connected with religious orders, and some belonging to the hospitals of various special orders.

16. The Franciscans had their house in the southeast corner of Montmusard, near the Gate of St. Anthony; the house was said to have been founded by St. Francis himself.[396]
17. The Hospital of the Knights of St. Thomas, martyr of Canterbury, was located in Montmusard, on the Street of the English.[397]
18. The Hospital of the Knights of St. Lazarus for lepers was located in the northwest corner of Montmusard along the seawall.[398]
19. The Trinitarian order had a house in the southwest corner of Montmusard along the seawall.[399]
20. The Hospital of St. Catherine, apparently a possession of the monastery at Mount Sinai, was located in the southwest section of Montmusard along the seawall.[400] In this connection it is worth mentioning that there were a number of other Orthodox or Eastern Rite churches in the city, including the Monastery of St. Marina [Margaret] and St. Sabas (mentioned earlier). There was also an Orthodox cathedral, and the Syrian Jacobites had a cathedral as well, named in honor of St. Mary Magdalene.[401]



88. Montfort Castle: view. (photo: Anthony F. Kersting)

Finally, Enlart cites a list of other churches whose names we know, and in some cases, whose locations are known but about which otherwise we know very little. Other churches include St. Denis, St. Lawrence of the Knights, St. Leonard, St. Mary of the Knights, St. Nicholas, St. Roman of the Gardens, as well as St. Agnes, St. Bartholomew, St. George, St. Stephen, Notre Dame de la Place, and St. Demetrius.[402]

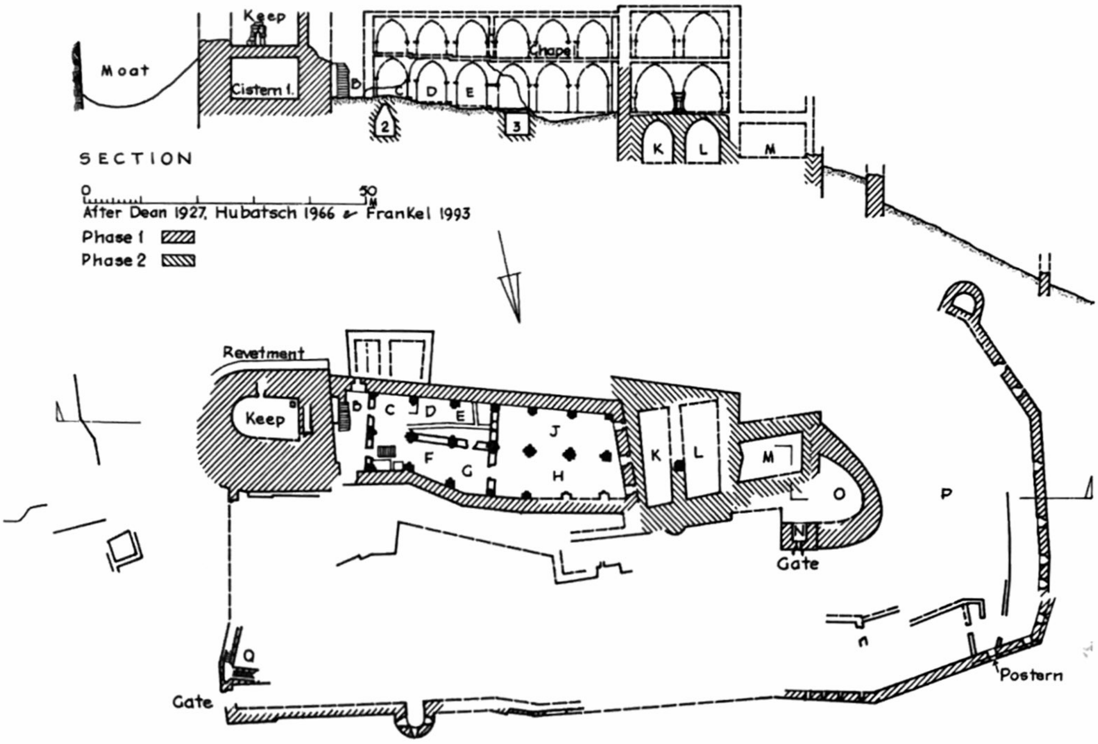
Hamilton in 1980 counted a total of fifty-nine churches and chapels known to exist in Acre in the thirteenth century, of which Enlart's list above is only a partial accounting.[403] In 2003 Pringle identified seventy-one churches and religious houses documented in Acre,[404] which was not an excessive number of religious institutions for a city of the size of Acre; however, the ecclesiastical problem was that many, if not most of these churches, were not subject to the bishop of Acre. In any case, whereas a few of these churches exist today albeit fragmentarily, including especially the substantial remains of the Church of St. John to the level of the first storey, the overwhelming majority are gone, and the largest and most important, like the cathedral and St. André's, are apparently completely destroyed. In these specific cases, the traditional view has been that the first could be identified as the foundations under what was the Arab school east of the Acre Museum, the cathedral was thought to have been razed so the current Djazzer Pasha mosque could be built on the site, and the last was completely obliterated. Recent excavations have clearly identified the Church of St. John in the site indicated; the location of the cathedral is as yet unknown, but it must be farther to the east than heretofore considered; and there is debate about where the Church of St. André may have been, with two possible locations under discussion being near what was the former site of the Templar headquarters.

It is evident from even a cursory consideration of this list of churches in Acre that many must have been built, rebuilt, repaired, or renovated in the first half of the thirteenth century. A certain number may have been constructed after the earthquake of 1202, a number were erected in the new suburb of Montmusard, some belonged to the new religious orders, and some went up or were rebuilt during the lively years of the commune, that is, 1231 to 1243. It is truly unfortunate that so much is gone today, but given the activity in Acre that we are hypothesizing, it is not surprising to find church building in other locations as well, particularly in certain Crusader fortifications.

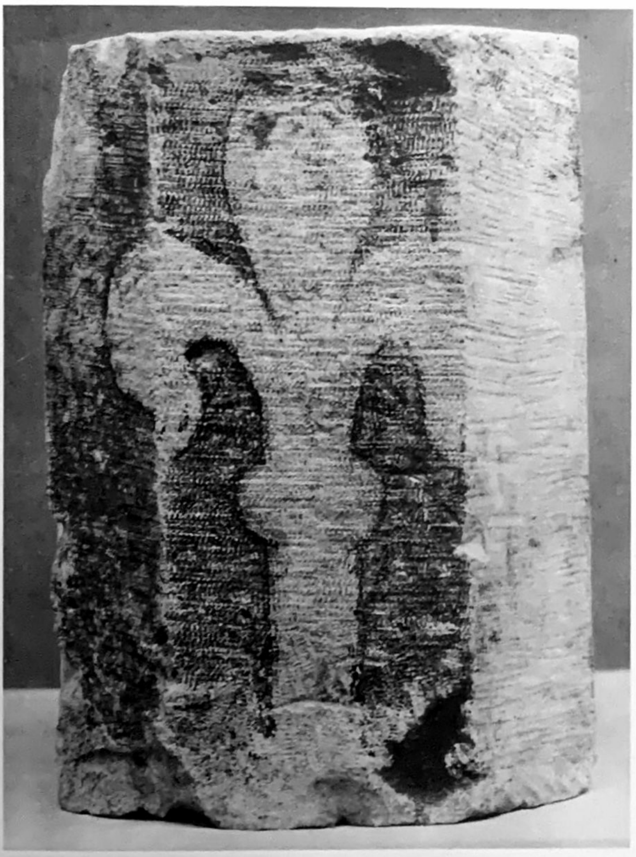
The Castle of Montfort (Figs. 88–93)

The most important castles with new chapels documented in the period, 1225–44, are those of Montfort and Safed. Montfort was built from the late 1220s to *c.*1240 to be the headquarters of the Teutonic Knights in the Latin Kingdom. Safed was built in the 1240s by the Templars at the instigation of Benedict of Alignan, bishop of Marseilles, for which there is a detailed text written between 1260 and 1267, probably about 1264. Although both castles lie in ruins today and Safed is especially devastated, both of them offer important evidence about the Crusaders and the art of the Crusaders in the Holy Land.

The Castle of Montfort is located in the hills, only 16 kilometers northeast of Acre (Fig. 88).[405] In 1226 the Teutonic Knights acquired a lordship in this region and in 1227 they decided to move the center of the lordship from Chastiau dou Rei (Mi'iliya)[406] to the isolated and defensible position of Montfort (Qal'al-Qurain, or Starkenberg), just north of Mi'iliya and Judin.[407] The Teutonic Order apparently chose this site because it was remote, outside the city of Acre, in order to build a strong and secure new castle. Compared to the huge fortresses of the Templars at 'Atlit, or the Hospitallers at Crac des Chevaliers, this castle was rather modest in size and compact in its arrangement, and it was built on



89. Montfort Castle: plan and elevation.

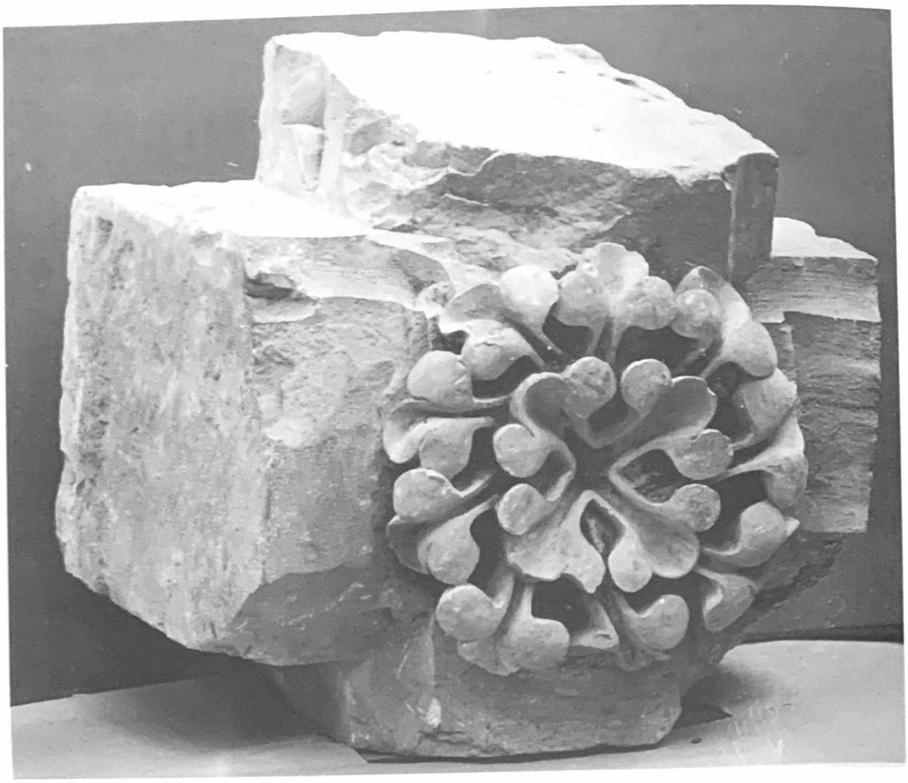


90. Montfort Castle: rib of groined ceiling, painted fleur de lys (area 'J'). (photo: Metropolitan Museum, New York, gift of Clarence Mackay, Archer M. Huntington, Stephen H. P. Pell and Bashford Dean, 1928)

a site where no castle had existed previously. Work on the fortress apparently began in 1227 with the arrival of the first German Crusaders in the Crusade of Frederick II. Bohemond IV of Antioch and Tripoli pledged 100 bezants a year to aid in the construction, and in 1229, Hermann von Salza, the redoubtable master of the Teutonic Knights, wrote to Gregory IX for his financial support, despite the pope's continuing problems with the emperor.[408] Although the dating of Montfort is not precise – we can identify work between 1226 when the site was acquired, 1227/8, when construction work was begun, and *c.*1240, when the castle was fully functioning as the headquarters of the Teutonic Knights – it is nonetheless extremely important for our knowledge of Crusader artistic activity.[409]

The castle itself is a type of spur castle with heavy walls running along a ridgeline (Fig. 89).[410] It includes a D-shaped keep at the east end protected by a moat, to defend it from attack along the ridge. A system of double outer walls protected by round towers ran around the castle on the north and west sides. The south side was protected by the steepness of the drop-off. The entry gate was located at the northeast corner of the outer wall enclosure. West of the keep, the inner ward consisted of vaulted halls two-storeys high in the central section, and even possibly three-storeys high at the west end. To the north of the castle, down the hill in the Wadi Qurain, there was a fortified mill and what appears to be a guest house of the castle, with rib-vaulted halls.[411]

In his survey of the main part of the castle on the site, Pringle reconstructs a system of six groin-vaulted double bays on the first level. Fallen architectural debris indicates that the second-storey consisted of six rib-vaulted double bays. To the west of these halls, dating about the same time as the rib vaults in the second story, we find evidence for a large hall with rib vaults carried on an octagonal central pier on the first storey. This



91. Montfort Castle: boss (area 'E'). (photo: Metropolitan Museum, New York, gift of Clarence Mackay, Archer M. Huntington, Stephen H. P. Pell, and Bashford Dean, 1928)

hall was built on a basement with two massive pointed barrel vaults. It remains to be fully determined whether this latest part of the castle also had a second storey over the large chamber with the centralized vaulting system.

Although it is difficult to determine the exact functional arrangement of the interior of the castle because of subsequent destruction and neglect, the dilapidated condition of the site when Dean cleared it, and the methods used for clearing the

site, Pringle makes the following reasonable and persuasive interpretative proposals. The grand master's lodging and the treasury of the Order were in all likelihood located in the keep. The dormitory, refectory, and the chapel of the knights would have been on the second storey of the inner ward. The groin-vaulted service basement was below. The chapter hall was the large room with the rib vaults arranged around the central octagonal pier to the west, built over a basement of two pointed barrel vaults.[412] It is unclear to me whether the chapter hall was located at the first or second storey above this basement.

In the architectural forms and their construction, E. G. Rey was the first to comment on what he saw to be the German characteristics of the work.[413] His comments are rather general, however, based on what he saw to be the massing of the defensive construction, the recent arrival of the Teutonic Order in the Holy Land, and the lack of time for the architectural developments of either the Hospitallers or the Templars to have had much effect on them. Pringle, in his collaborative work on the castle of Judin, and Kennedy have more to say on specific parallels with German fortifications.[414] There is the idea of the free-standing keep at Montfort, which resembles a German *Bergfried*. The notion of a tower, or towers – the latter as seen at Judin – surrounded by a curtain wall, is parallel to thirteenth-century German design, for example, at Munzenburg. The design of several storeys of buildings compactly inserted inside the enclosure of the main fortification walls, which included a chapel and a great hall on one level, all of which completely filled the available space, was also typical. The choice of site is striking, completely different from an urban setting or the enclosure castle like Mi'iliya, the Teutonic Knights choosing instead the remote, isolated, and secluded wilderness. In any case, it is notable also that although we can see these German aspects in the siting and design of this castle – rather different from other Crusader castles in design especially – there are other, Gothic importations as well. These importations, whether French or possibly German, in their own way reflect a phenomenon similar to what we have found in the French Gothic features of the cathedral at Tortosa.

It is the chapel at Montfort that is one important point of focus for artistic developments. The chapel is located by Pringle to area "J" in the plan first drawn by Dean, then enlarged and elaborated successively by Hubatsch, Frankel, and Pringle. Pringle interprets the chapel to be at the second-storey level, however, not on the first storey, which Dean cleared and assumed to be the only level of the inner ward, except for the basement chambers, "K" and "L." Pringle interprets Dean's finds in the chapel to include a large set of fragments of stained glass, most of which are "green, blue, horn coloured and colourless; but no red pieces were found. Some pieces were painted in the French thirteenth-century manner *en grisaille*, with bands, interlaced foliation and on one, a human head depicted against plain or reticulated backgrounds."[415] Other important finds in the "J" zone include figural sculpture, such as a small helmeted head, apparently used on a corbel;[416] a rib voussoir with rare polychromed ornament (Fig. 90), in this case a yellow fleur de lys set against a black background; and foliate crockets from window enclosures.[417]

Other interesting finds come from the residential part of the inner ward, that is, the vaulted chambers east of the chapel, or the basement chamber, "K" under the chapter hall. In the residential bays, additional fragments of stained glass were found, along with a tiny grotesque head fragment from a capital, a capital with a crawling figure and foliate designs, and three handsome carved bosses from the rib vaults on the second storey (Figs. 91, 92).[418] Two such bosses were also found in chamber "K," one of the basement rooms under the chapter hall with the extant octagonal pier, along with other bits of glass and two stone molds for leatherwork (Fig. 93).[419] It seems clear that these finds in the chamber "K" area must have fallen there from above, since this chamber was barrel-vaulted, not rib-vaulted, and since we would not expect glazed windows in this basement chamber. It seems likely therefore that the glass and the bosses may have been part of the chapter hall above as originally configured. Also from chamber "K," one of the most mysterious finds was the bottom portion of an icon containing the feet of two standing figures, one wearing sandals, the other imperial buskins decorated with pearls.[420]

These important finds at Montfort are sometimes difficult to interpret in the framework of Dean's work of clearing the castle, and the subsequent studies that have been done have attempted to reconstruct the original configuration of the castle at the time of its completion. First there is the problem of dating these finds, for which we must differentiate between the architectural material, such as the works of architectural sculpture, and the objects and more specialized material, some of which was portable, such as the stained glass, and the polychromy on the voussoir, or the icon fragment, and the stone matrices. Everyone agrees that work began, as we have indicated above, in 1227/8. By the 1240s, Montfort was fully functioning as the headquarters of the Teutonic Knights.[421] As the power and prosperity of the Latin Kingdom declined rapidly in the 1260s, so too the circumstances of the Teutonic Knights at Montfort became increasingly precarious. Finally the castle was captured by the Mamluks in 1271, and destroyed.

Within this framework, I interpret the architectural work to have been substantially completed by *c.*1240. This corresponds to the period when the Order had the maximum resources at its disposal for this project and would have placed maximum emphasis on establishing its new headquarters here. I do not see any evidence to suggest that the architectural work would have dragged on into the later 1240s, the 1250s, or the 1260s. Therefore, it seems that the rectangular and octagonal rib vaults, the voussoirs of the ribs, and the figural and foliate architectural sculpture must have been done between 1228 and *c.*1240. This positions the work at Montfort, however different it may be in specifics, slightly later than the completion of the church at Tortosa in general. Certainly the helmeted head accords comfortably with such a dating, compared generally not so much with sculpture from Reims,[422] but rather with selected work on the transept portals of Chartres Cathedral in nature and design, if indeed such a claim is necessary. Certainly the handsome crockets and foliate bosses also compare favorably in design with those at Tortosa, if slightly more developed, especially the bosses. On the other hand the rather abstract foliate decoration on the capital with the crawling figure would seem to be earlier, that is, in the late 1220s, rather than later in the 1230s or early 1240s, like the carved bosses.

It is much more difficult to date the painted decoration, the stained glass, or the icon fragment, because of the independent character of that work and the lack of *comparanda*, and the fact that a special case must be made for each work separate from, but as related to, the architecture. Therefore, on the face of it we can only say that these important finds may date between 1227/8 and the 1260s. For the polychromy, there is no way to give a precise date in this period in the absence of other evidence at this moment. Although we do not have contemporary *comparanda* in the Crusader castles, it is interesting to see the use of painted ribs in the vaults of this castle chapel whenever it was done, comparable to what we see in France with, for example, the Sainte Chapelle in Paris in the 1240s. Obviously the polychromy may date originally to the 1230s, when the chapel was being completed, but careful examination of the surviving voussoir will be necessary to ascertain whether the surviving decoration is the original layer, or the product of later work in the period 1240s–60s. The only *comparanda* for the stained glass is found at the town church in 'Atlit, to which we shall turn later. It would seem likely, however, that the glass at Montfort would belong to the period when the chapel was being completed, that is, *c.*1240, rather than much later. Finally, the icon fragment raises important problems, which we shall discuss separately later as well.

The Castle of Montfort is overall an important example of several phenomena that characterize Crusader artistic developments in the second quarter of the thirteenth century. It is a work for a corporate patron relatively newly arrived in the Holy Land, and which retains significant ties to its European place of origin, namely Germany, ties reinforced by the appearance of Emperor Frederick II in 1228. It is a work that utilizes a mixture of local and imported resources in terms of manpower and materials, and architectural and artistic design, characteristics that we have found in the art of the Crusaders in other periods and in other sites. Montfort Castle exemplifies the lively activity that we find throughout the Latin Kingdom and also in Tripoli when it comes to understanding the artistic developments during the troubled years between 1225 and 1244. Finally, Montfort by its finds provides eloquent testimony that these new castles were centers for a surprisingly rich array of artistic work, including large scale and miniature sculpture, monumental painting, glassmaking, pottery, and panel painting, among others. Despite the brevity of the archaeological investigation carried out in 1926, Montfort demonstrates the value of serious excavation in terms of the richness of the possible finds and the enormous potential for expanding our knowledge of Crusader history, architecture, and art inherent in such a project.

The Castle of Judin

One other castle that deserves mention here because it was also constructed by the Teutonic Knights is the fortress at Judin.[423] Qa'lat Jiddin or Judin is located about 5 miles due south of Montfort. Its recent investigators report the documentary, archaeological, and architectural evidence indicates the castle was built on an abandoned settlement (a *gastina* or a *khirba*) in the thirteenth century by the Teutonic Order. Like the plan of Montfort, discussed previously, which is comparable to German fortifications in the Rhineland between 1100 and 1300, Judin is also unusual among Crusader castles in its design. Judin has an inner ward consisting of a pair of rectangular towers, raised at either end of a ridge and surrounded by a high enclosure wall with several storeys of vaults built against its inner face. Probably there was also an outer wall lower down the slopes. The researchers conclude "the plan type of Qa'lat Jiddin and its general similarity to that of Montfort would thus appear to reinforce the attribution of the castle to the Teutonic Knights, and its dating to after 1220. The fact that it is not mentioned in any of the sources which refer to the building of Montfort itself from 1226/7 onwards could also possibly suggest that it was constructed somewhat later. Unfortunately the castle has not as yet yielded any finer architectural detailing or sculpture that might allow for more precision."[424]

The evidence of Qa'lat Jiddin, which has so far yielded so little artistic material, makes the Castle of Montfort that much more important in assessing the role of the Teutonic Order as patrons of the arts. Always bearing in mind that the later use of both sites may have a significant bearing on what evidence for Crusader artistic activity there may be, this comparison of Jiddin and Montfort also seems to strengthen the idea that, as the headquarters of the Teutonic Knights in the Latin Kingdom, Montfort was the object of important artistic work, just as Crac des Chevaliers was for the Hospitallers and Chastel Pelerin was for the Templars. We might not expect to find at Jiddin some of the refinements that appear at Montfort, such as the polychromy or the stained glass, but it is curious that no decorative sculpture of the Crusader period has been found on the site. Artistic decoration aside, however, the construction of Jiddin so close to Montfort in time and place is clearly a further indication of the intense architectural activity, not only by the Teutonic Knights in the 1220s and 1230s specifically, but also by the Crusaders more generally in this period. Jiddin also is a further indication of the large fortification projects in heavy masonry reflected elsewhere in urban and isolated castle settings during these years.

The Castle of Safed (Figs. 94, 95)

The Castle of Safed 40 kilometers east of Acre and 24 kilometers east southeast of Montfort provides us with additional important insights about Crusader architectural activity.[425] In this case, a detailed text was written *c.*1264 by an anonymous author for Benedict of Alignan, bishop of Marseilles, describing its construction, a text that is, in fact, the fullest account extant for the building of any Crusader castle.[426] Unfortunately, the huge site, now mostly covered by a modern town, including a forest inside a town park, remains largely unexcavated and the exposed physical remains of the castle are scarce and difficult to interpret.

The Castle of Safed is important for several reasons. It was one of the largest Crusader castles built, with its main fortifications surrounding an area 300 by 170 meters.[427] In the size of its garrison, it ranks with Crac des Chevaliers; only Chastel Pelerin at 'Atlit was substantially larger in that regard.[428] It occupied a strategic site by which it defended access to Acre along a route west from Damascus across the Jordan at Jacob's ford. That ford had been defended briefly by the castle called Chastelet, built by King Baldwin IV in 1178, but Saladin had attacked and destroyed this castle in 1179, and it had never been rebuilt.[429] Safed was a castle completely erected by the Templars, like 'Atlit, but significantly different in most specifics as far as we can tell, the results of different sites, different materials, and different circumstances for the construction campaigns. Safed has been a major desideratum for excavation for a long time, and a preliminary dig was carried out in the 1960s. By 2003 an excavation sustained on a modest scale by the Israel Antiquities Authority had commenced. Should expanded excavations be possible at some point in the future, the Crusader castle at Safed would provide not only a remarkable opportunity to pair the detailed account of its construction with the actual physical remains, but also the chance to compare the Templar work there and at 'Atlit.

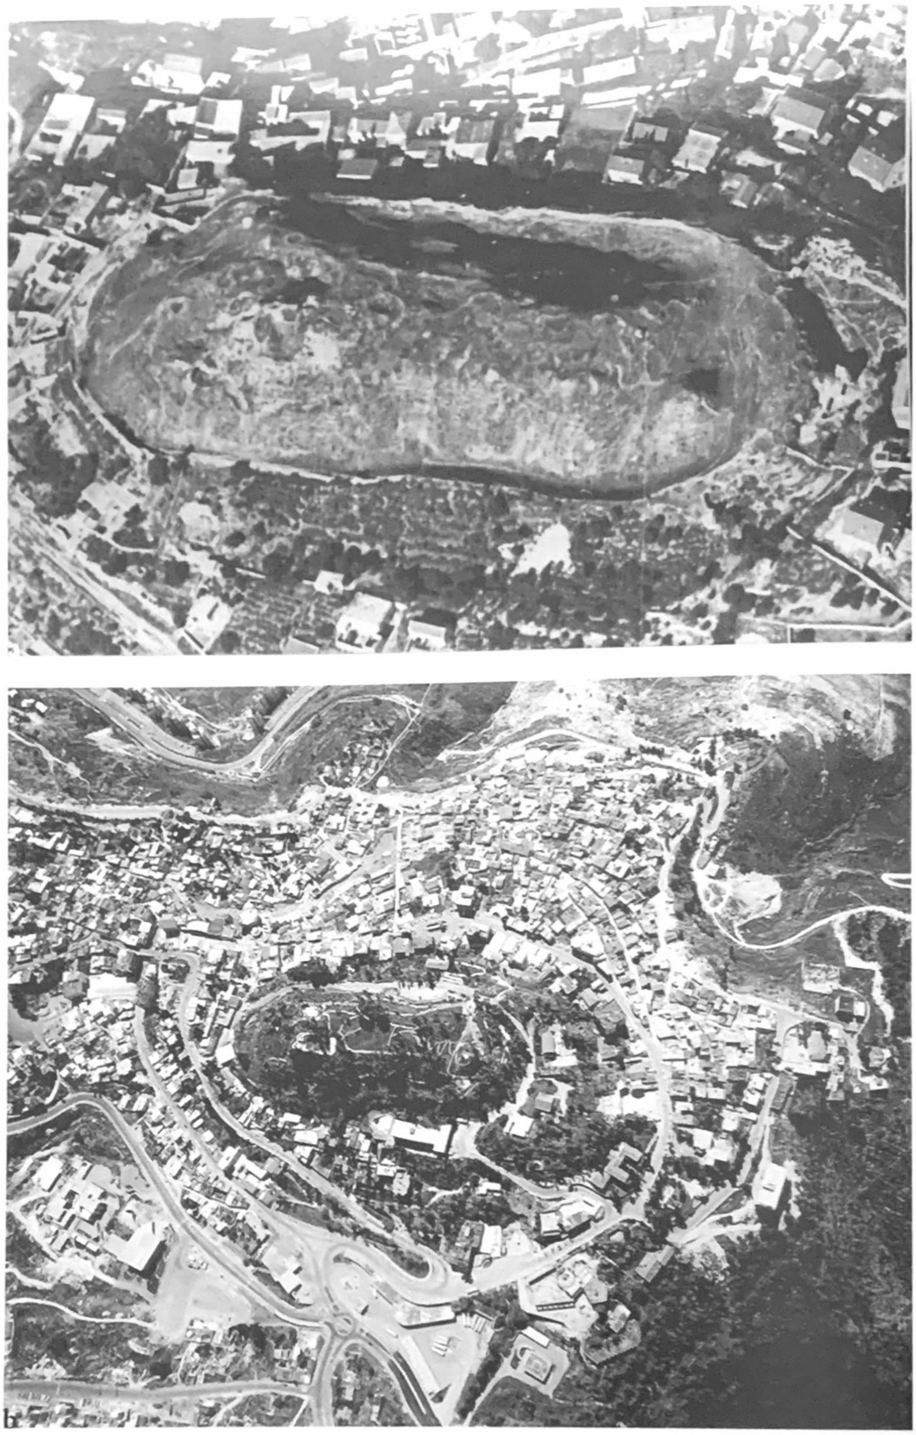
There had been a smaller castle on the site at Safed, which was captured by Saladin in 1188, and it was only in 1240 that Safed was returned to Crusader control according to the terms of the treaty arranged by Thibaut of Champagne. According to the text, it was a visiting pilgrim, the bishop of Marseilles, who persuaded the Templars to undertake the rebuilding of this castle on a large scale, based partly on his grandly stated argument that Safed would form a shield for Acre by closing the gates of Damascus to Muslim invasion of the Latin Kingdom.[430] In fact, as Smail has argued, no castle could block an invading army. Rather what it could and did do was to provide the Templars with a major base of operations to control this region and to respond to any threat of attack from the east.[431]

The Templars began the reconstruction of this castle on 11 December 1240. Benedict of Alignan came to the site on this day to celebrate mass; he laid the first stone, and "on the stone he displayed a silver gilt jar full of money to support subsequent work."[432] Using a large contingent of Muslim prisoners, as we have mentioned previously, work proceeded with all deliberate speed, and by the time that Benedict of Marseille was ready to sail for home in 1242, the Templars were able to garrison the castle and use it as a base of operations. It is said to have been substantially completed in the period of three years.

Bishop Benedict returned to Safed in 1260 and, while revisiting the castle, was able to see it fully operational. The text describes what he saw, why the castle was so strong, and some of its major functions, in words written in the early 1260s, before the castle fell to the Mamluks in 1266:

> It is not easy to convey in writing or speech how many fine buildings there are there: what fine and numerous defences and fortifications with ditches, which measure 7 cannas [15.4 m] in the depth of rock and six [13.2 m] in width: what inner walls, 20 cannas [44 m] high and a canna and a half [3.3 m] thick at the top: what outer walls and trenches, 10 cannas [22 m] in height and 375 cannas (825 m] in circumference: what underground tunnels between the outer wall and the [inner] ditch with underground chambers round the whole castle for 375 cannas [825 m]: what casemates, which are called *fortie cooperte*, which are above the ditches and underneath the outer wall, where there can be crossbowmen with great balistas which defend the ditches and things near and far and cannot be seen by others from outside where they can be safe without any other protection: what towers and battlements where there are seven towers of which everyone is 22 cannas [48.4 m] in height, ten [22 m] in breadth, with walls two cannas [4.4 m] in thickness at the top: how many offices for all necessities: what number, size and variety of construction of crossbows, quarrels, machines and every sort of arms, and what effort and amount of expense in making them: what number of guards every day, what number of the garrison of armed men to guard and defend and repel enemies who were continually required there: how many workmen with different trades, how much and what expenses are made to them daily.[433]

The text goes on to report that "in the first two and a half years, the house of the Temple spent on building the castle of Safed, in addition to the revenues and income of the castle itself, eleven hundred thousand Saracen bezants, and in each following year more or less forty thousand Saracen bezants. Every day victuals are dispensed to 1,700 or more and in time of war, 2,200. For the daily establishment of the castle, 50 knights,



94. The Castle of Safed: **a.** Aerial view, at time of WWI (photo courtesy of the Bayerisches Hauptstaatsarchiv, Kriegsarchiv, Munich), **b.** Aerial view, c. 1990 (photo courtesy of Benjamin Z. Kedar).

30 serjeants brothers, and 50 Turcopoles are required with their horses and arms, and 300 crossbowmen, for the works and other offices 820 and 400 slaves."[434]

Finally, the text extols the ways the castle is useful and necessary to the Crusaders. It describes how the raids by Muslims on Acre were now impeded, how the lands to the west between Safed and Acre were protected by the castle for travel, trade, and agriculture, whereas to the east, the Templars were able to win many victories against the Muslims from Damascus. Furthermore, Safed controls in its lordship and district more than 260 *casals* or villages, in which there are over 10,000 men with bows and arrows for defense, as well as serving as a tax base. Finally, it is notable that the Castle of Safed makes possible visits to a whole range of holy sites in the region, including the following:

1. The well of Joseph, where he was sold by his brothers;
2. The city of Capernaum, where Jesus lived and began his preaching and personally perfomed many miracles, etc.;
3. The mount of the Beatitudes, where the miracle of the loaves and fishes took place;

After M.Pease, B.S.A.J Survey 1989

95. The Castle of Safed: Mamluk keep with the Crusader Chapel of St. George on the interior. (photo: after Pringle, *Churches*)

4. The table of the Lord, where Jesus showed himself to his apostles and ate with them, as we read in the Gospel of the fourth Sunday after Easter;
5. The Sea of Galilee, where Peter and Andrew, Philip and James the Less were born and where Christ chose them to be apostles;
6. The place called Magdalon, where St. Mary Magdalen was born;
7. Finally, the places of Nazareth, Mount Tabor, and Cana of Galilee, where Jesus lived, or visited and worked miracles.[435]

Clearly the benefits of Safed's strong, fortified position were great, not only for military, political, and economic reasons, but also for religious pilgrimage activity as well.

It is difficult to relate the text to what we see on the site today, for reasons of subsequent building and destruction from large earthquakes in the eighteenth and nineteenth centuries. Because there has been no comprehensive recent investigation of the site, the best plan is still that found in the *Survey of Western Palestine*, reproduced by Pringle.[436] The text raises many problems and there are certain conspicuous discrepancies when it is compared to the extant site and the physical remains of the

96. The Sea Castle of Sidon: view from the harbor. (photo: Anthony F. Kersting)

castle. Two examples will suffice. The plan shows all rounded towers on the outer walls, not rectangular ones, which Huygens and others have associated with Templar architecture.[437] When it mentions towers, the text says nothing about their shape. The rounded towers – even if they are sheathed in later masonry – found at Safed on the outer fortification walls seem to be, at the core, the towers constructed in the early 1240s. Therefore they seem to provide clear evidence that there was no formulaic differentiation between Templar castle design with rectangular towers and Hospitaller castle design with round towers, as scholars have attempted to argue in the past.[438] Instead, the use of round and rectangular towers seems to have been, in the first instance, partly a matter of the development of defensive architecture, with round towers developing strongly in the thirteenth century. Secondly, they seem partly to derive from the needs of the site, that is, where in the defensive system the tower was located. Thirdly, the possibility is clearly documented that, as, for example, at Crac des Chevaliers, there could be both rectangular and round towers in simultaneous use for a castle in the thirteenth century – sometimes to be explained by historical accretion – as well as rectangular towers that were later modified to a round tower configuration.

The other problem that Pringle raises of great interest here concerns the *donjon*, which was circular.[439] It is not mentioned in the text of the "De constructione casti Saphet," unless, as he points out, it was referred to as one of the towers of the inner ward, of which the text cites seven. There is no doubt that the *donjon* must have been rebuilt by Baibars and later sultans, but nonetheless, in origin it was probably round, not rectangular.[440] Pringle cites a seventeenth-century source as describing the south end of the castle with "a large octagonal room, which receives its light only through a dome or a cupola; this is round, quite open and without any roof. This room could formerly have been the church or chapel of the castle."[441] Pringle discusses the accounts of this structure by slightly later Dutch travelers, J. Heyman (1700–9) and J. van Egmond (1720–3), that corroborates Dapper, and makes what correspondences he can with the physical remains. Finally, on the basis of the extant evidence, both written and archaeological, he makes a hypothetical reconstruction drawing of how he thinks the castle Chapel of St. George at Safed may have been configured.[442]

Pringle readily admits that the evidence for this round chapel in the *donjon* is circumstantial, and he characterizes this interpretation as "a hypothesis to be tested by further excavation." Certainly *donjon*s and fortified round towers with circular, vaulted rooms are not uncommon in Gothic architecture, as we see it in the Ile de France, for example, at Villeneuve-sur-Yonne *c.*1205 or Dourdan in the 1220s.[443] However, the fact is this hypothesis is important, not only because it seems plausible and correct, but also first because it provides a significant and probable example of a round chapel built by the Templars in the early 1240s. Second, it is timely as proposed in this frame of reference, because it also indicates that the new round/polygonal church at ʻAtlit was neither the first Templar round church in the Holy Land, nor was it necessarily done in the 1250s. Nonetheless, further excavation is needed.

The Templar castle at Safed was a major work of Crusader military architecture, which focuses emphasis on the critical need for an adequate archaeological and architectural history study of this site. Our lack of knowledge about Safed currently limits what we can say about its larger significance in the development of Crusader castle architecture in the early 1240s. We are also deprived of the archaeological finds here that make the site of Montfort so interesting and important.

97. The Sea Castle of Sidon: plan of the city with the sea castle and the town castle. (photo: after Pringle, *Churches*)

We have nothing at Safed at the moment reported and published, for example, in the way of architectural sculpture, glass, painting, metalwork, pottery, or even coins. It is precisely this kind of evidence we would like to have to compare with the finds at other major castles like Montfort, and what we need to help fill in our knowledge of Crusader artistic activities in the early 1240s. All we have at the moment are the incidental indications of the travelers' accounts, for example, a letter of either J. van Egmond or J. Heyman that indicates inside the round "Temple" [=chapel] chamber, one can see all over the walls niches in which to place idols. By "idols" the Dutch Protestant writer in the early 1700s no doubt was thinking of images of some kind in a typical Roman Catholic church setting. We would like to know more about such images and their setting by further study here and in other Crusader castle chapels.

The Castles at Toron and Sidon (sites: Maps 1, 2, 4, 6, 7, and 10)

Among other fortification projects that we shall not discuss – because little survives that is medieval – is Toron. The Castle of Toron, essentially rebuilt in the late eighteenth century, is another site that belongs to this period – in this case to 1229 – like Montfort, and Safed slightly later, but one that has been investigated very little and for which there is in any case no detailed textual description. This castle commanded the important territory to the east of Tyre on the road from Damascus to the coast, through Banias and past Qalat Subeibe.[444]

Finally, we cannot omit mention of the important work done at Sidon on the sea castle, which was begun in this period (Figs. 96–100).[445] The problem at Sidon, of course, is that the work that was done in 1227–8 was swallowed up later in the

98. The Sea Castle of Sidon: entrance to the sea castle. (photo: Anthony F. Kersting)

enlargements carried out first while King Louis IX was in residence here, and even later when the Templars controlled the castle before the fall of the Latin Kingdom to the Mamluks. Nonetheless, there are other castles that had major new additions built in this period, most notably, Chastel Pelerin at ʿAtlit and Crac des Chevaliers, that we must comment on here in some detail.

The Fortified Town of Chastel Pelerin at ʿAtlit (Figs. 101–103)

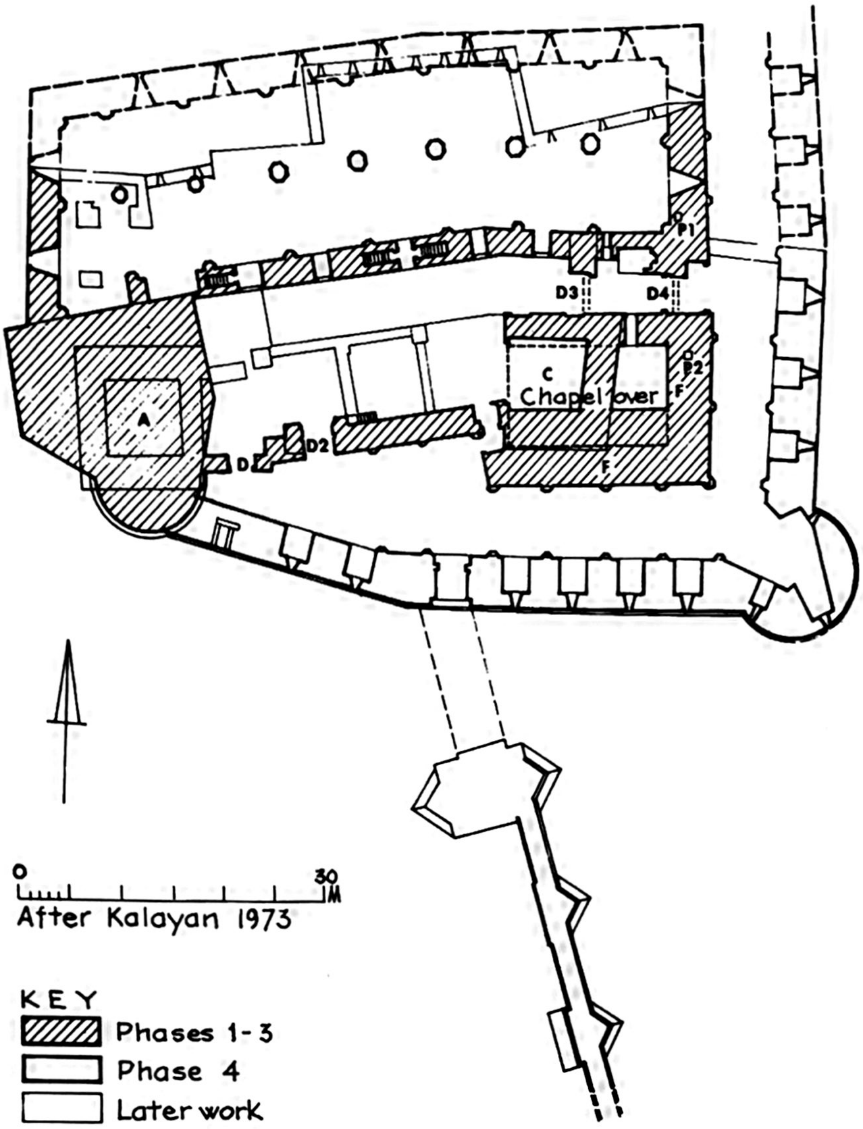
The fortified town of ʿAtlit had been begun after the castle was erected in 1217–18 by soldiers of the Fifth Crusade led by Walter of Avesnes. The *faubourg* that grew up outside the castle walls probably belongs to the second quarter of the thirteenth century.[446] Like the developments at other major sites, the construction work probably moved along more or less continuously when possible, spurred on here by the attacks of the Muslims in 1220 and their sporadic raids thereafter.[447]

The town at ʿAtlit was given a landwall outside the castle, 645 meters long on the east side and 230 meters on the south. The highest surviving portion is 7.25 meters, measured from the bottom of the ditch in front of it. The wall is built of large limestone blocks.[448] No doubt the stables at the south end of the walls constituted the first town structure to be put in use after the walls were completed. Johns proposes to date the city walls in the 1220s, presumably just after the unsuccessful Muslim assault by al-Muʿazzam in 1220. As work in the town continued, a church was erected for the burgesses, that is, the craftsmen and merchants living there. Their court is mentioned in a text of about 1250, so we know of their well-established existence by that time.[449] Their church was probably done before that, most likely in the 1240s (Fig. 101).

The church itself consisted of one bay for the nave, approximately 10 meters square, and a seven-sided polygonal apse for the sanctuary. The church was rib vaulted with the ribs springing from the tops of shafts that rose from handsome column bases. The building was apparently left incomplete, with a makeshift wall closing the west end, for unknown reasons. On the exterior, wall buttresses approximately 1 meter square at ground level attest to the fact that the walls were meant to be proportionally high and pierced by windows. Stained glass fragments from these windows were also found on the site (Fig. 103).[450]

Compared to the more conservative – and much larger – cathedral church at Tortosa, this small parish church was designed in a more developed Gothic style. With its polygonal apse, it is a diminutive version of the east end of the cathedral in Nicosia, which had been under construction on Cyprus since the start of the thirteenth century; the choir and transepts of St. Sophia were finished in 1228.[451] Johns points out that the ʿAtlit parish church resembles the early work there, including the foliate sculpture from two of the compound pier capitals and one single capital extant (Fig. 102). He also compares the column bases with their upper torus and retention of the talons at the corners.[452] Finally, it is significant that the ribs of the church at ʿAtlit have different profiles according to their use, as also found in St. Sophia, although the precise designs of the profiles are not the same.[453] The diagonal ribs have a full middle roll with slightly pointed arrises, and the transverse ribs have a graceful double roll. These ribs also find parallels in the early work of St. Sophia in Nicosia according to Johns.[454]

Johns was uncertain which church came first at ʿAtlit, the parish church in the *faubourg* or the round church inside the castle – the latter which we take to be later – because of the ongoing excavations he was conducting. Nonetheless his comparisons with St. Sophia seem apt, even if we cannot establish any evidence for a direct linkage between the two churches. It may, however, be worth further consideration to look again at the molding profiles here seen against the development of Gothic architecture in the Latin Kingdom and in France. Interest in the molding profiles stems from the fact that the use of ribs in the vaulting is an important feature of Gothic architecture found in rather few extant Crusader buildings, but which appear here at ʿAtlit. Secondly, the profiles found in this church at ʿAtlit, which are quite different from the simple and heavy, round profiles of the ribs in the Church of the Holy Sepulcher in Jerusalem, are comparable to the more developed versions found in the *Coenaculum* in Jerusalem, clearly indicating a later phase in the development of rib vaulting in the Latin East. Finally, E. Roberts writes, "the interest of moldings stems from the fact that medieval architects personally drew the patterns from which the templates were cut. Mouldings in a sense recover lost working drawings of the Middle Ages of which only a fraction survive."[455] Even though she is referring to moldings from the mid-fourteenth century and later, the gist of what she

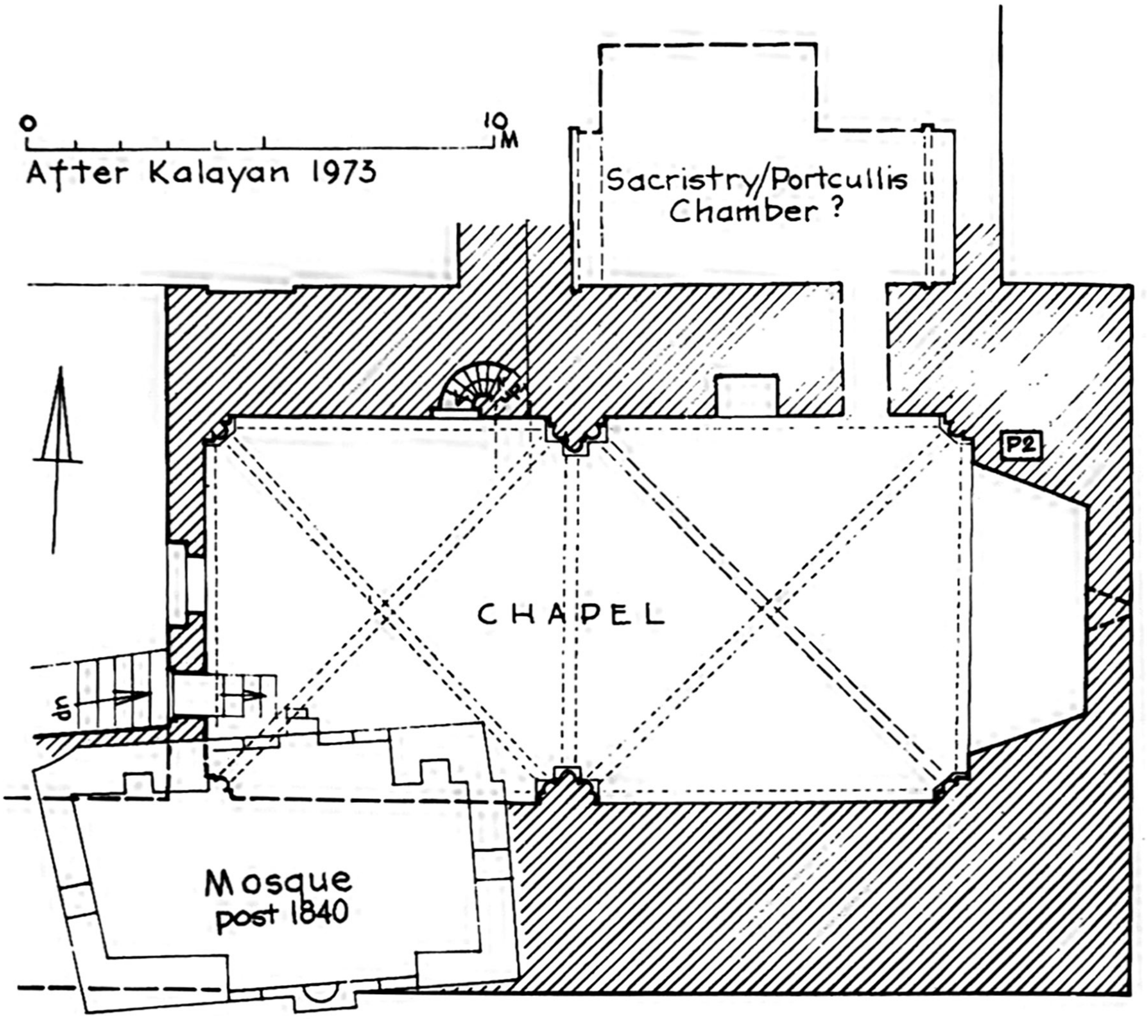


99. The Sea Castle of Sidon: plan of the sea castle. (photo: after Pringle, *Churches*)

says pertains to our material as well here between the 1140s and the 1240s.

The first point to be made is that the transverse and the diagonal rib profiles found in the 'Atlit town church compare closely in a developmental way with those known from the *Coenaculum*.[456] The profile of the diagonal ribs at 'Atlit is quite different in proportions, in formal components and in appearance, compared to those of the Cenacle. The 'Atlit profile is more slender, less fat and heavy in proportions. It has arrises between the central and side rolls whereas the other has none, but the latter does have a central fillet that does not appear at 'Atlit. Finally, the 'Atlit profile is slightly pointed on the central roll and the side rolls protrude less, whereas the Cenacle profile appears larger and made up of all rounded main forms. Similarly, on the transverse ribs, the 'Atlit roll is more graceful, less flat and heavy. The deep cavets have given way to more open versions between the slender rolls, and there is no strongly stated flat surface between the rolls as at the Cenacle, only a shallow cavet. In regard to the column bases at 'Atlit, it is interesting that the griffe is still used *c.*1240, a feature that was common in the twelfth century and that appears at the Cenacle.[457]

If we compare these same profiles of the diagonal and profile ribs, as well as those of the column bases at the 'Atlit parish church with a selection of available published profiles from major examples in France, it may further assist us in evaluating their relative dating. Our selection includes profiles at Noyon (1157–85),[458] the early campaigns at Bourges Cathedral (1195–1214),[459] Amiens Cathedral (1220s–36),[460] the rayonnant part of St. Denis (1231–50s),[461] Burgundian Gothic churches (late twelfth to mid-thirteenth centuries),[462] and the drawings of Villard de Honnecourt in his sketchbook done before his death in the mid-1230s.[463] Unfortunately Johns did not draw the column base profiles from 'Atlit, but the photos he and Pringle published allow us to see a few major points as related to the examples cited earlier.[464] In relation to the early and later Gothic profiles in the Ile de France, 'Atlit is quite comparable, but it has certain distinctive characteristics. First, the lower torus is quite flat, not so robust or inflated as those in France, and the cavet is relatively smaller and deeper. Second, the

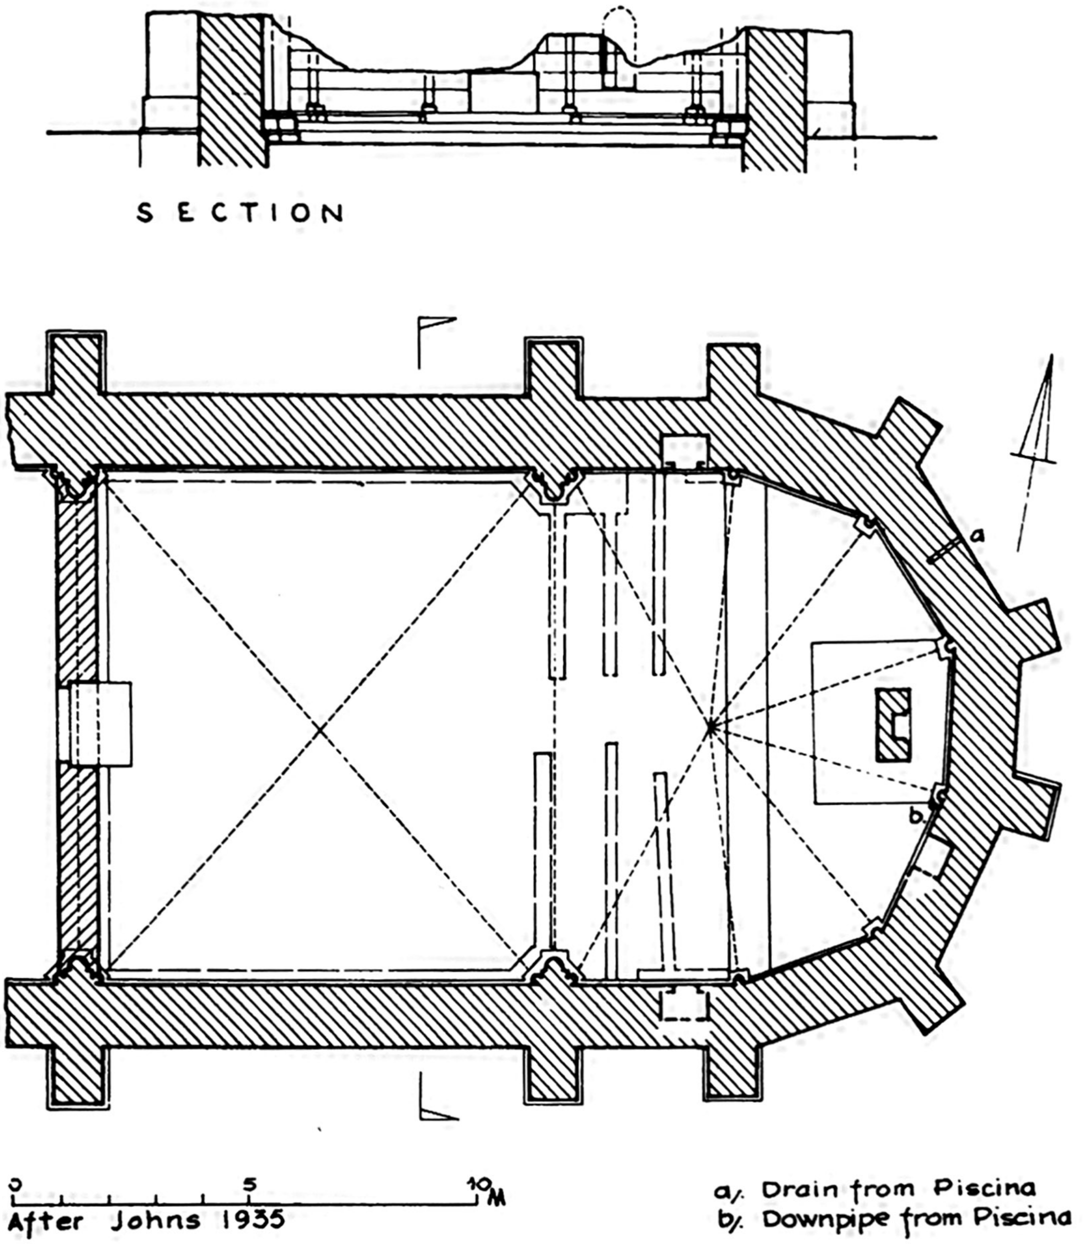


100. The Sea Castle of Sidon: plan of the chapel. (photo: after Pringle, *Churches*)

proportions of the column bases at 'Atlit indicate that they are flatter, not as high or as full, and that the ratio of the upper torus to the lower torus is usually smaller. That is, whereas at 'Atlit the lower torus is approximately 2.5 times the radius of the upper torus, those profiles from the Ile de France are mostly twice the radius. In general we can say, finally, that the 'Atlit profiles belong to the more developed group of examples, related to the *comparanda* in the first half of the thirteenth century from the Ile de France, in contrast to the early examples from Noyon.

For the rib profiles, we turn to the Burgundian examples. They are useful, partly because the published examples make comparison possible and partly because the independent Burgundian group forms a useful analog to what must have been also a separate Crusader Gothic group, if the other examples from the Latin Kingdom, for example, from the churches in the major cities built between *c.*1200 and *c.*1250, were extant. We can see that the Burgundian Gothic churches also use different rib profiles for transverse and diagonal ribs, and that the profiles are similar to what we find at 'Atlit. Relatively speaking, it seems evident that the 'Atlit profile for the diagonal ribs belongs to the more developed phase in terms of form, when compared to the Burgundian parallels.[465] There is a similar comparison for the transverse rib profile in the sense that the two rolls of the 'Atlit example are more slender, less round and fat, despite the absence of fillets or arrises.

Finally, when it comes to the question of placing the 'Atlit profiles in a chronological context, we can see how useful the Burgundian Gothic examples are by comparison. Just as the Burgundian Gothic churches changed and developed on their own terms until the mid-thirteenth century, at which time a new wave of Gothic design representing the refined Parisian style of architecture stimulated by King Louis IX overwhelmed the region, so too in the Latin Kingdom we can see a similar situation. First, there is the advent of certain features of Gothic architectural design, which arrives somewhat tentatively in the Crusader States during the mid-twelfth century, and more confidently in the second half of the twelfth century. Second, there is the arrival of King Louis IX in the Latin Kingdom in 1250–4 as a major patron of architectural activity in the Holy Land. The period in between, that is, 1191 to the 1240s, was a time of independent development when the new Gothic architecture was adopted more fully and adapted for use in the circumstances of the Crusader States. One of the best extant examples of this is the Church of St. Sophia in Nicosia to 1228. On the mainland, we have glimpses of the developing Gothic in the 1220s, 1230s, and 1240s at Tortosa, at Montfort, at Safed, at Crac des Chevaliers – to be discussed later – and

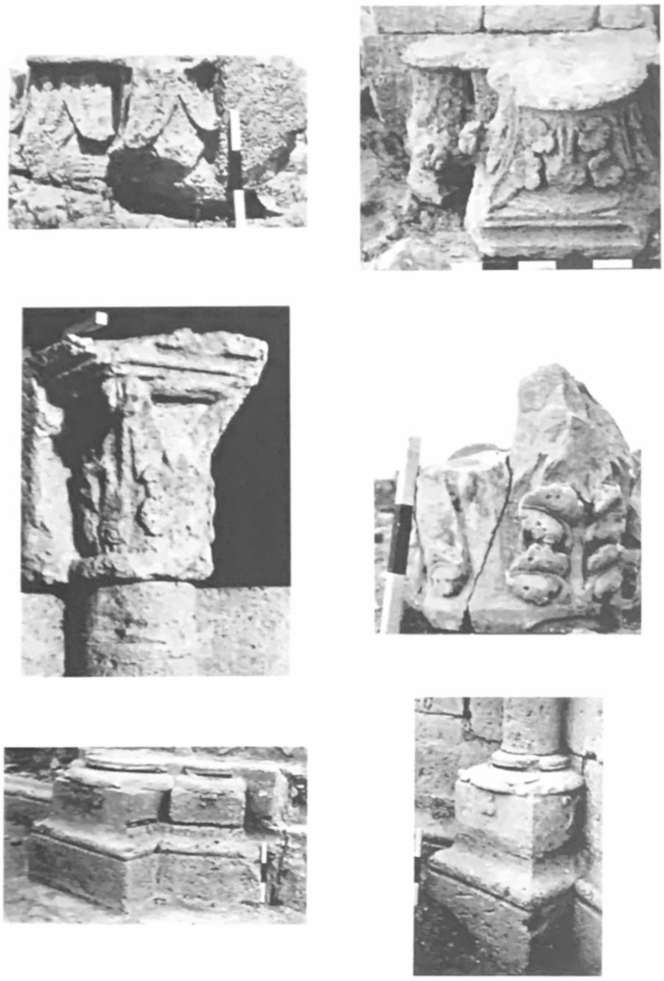


101. ‘Atlit, Plan of the Town Church. (photo: after Pringle, *Churches*)

here at ‘Atlit, but unfortunately much is lost, especially at Acre.

Besides the question of the profiles at ‘Atlit, there are also foliate capitals, carved bosses, and floral designs on the pedestals of the column bases to consider and also the plan of the little church.[466] In regard to the decorative sculpture, the style of the foliate designs, although moving in the direction of greater naturalism, is somewhat abstract. The leafy designs on the capitals can be seen to be more developed than, for example, certain examples at Laon in the late twelfth century,[467] and more comparable to later Gothic developments at the Cathedrals of Notre Dame in Paris and Chartres between the late twelfth century and *c.*1230.[468] In fact, just as we see some variation in the "naturalism" of the leafy designs at Chartres, we also find similar differences at ‘Atlit, but nothing at ‘Atlit matches the extent of naturalistic development we see at Chartres. There is also the fragment of a carved boss with foliate design, clearly a Crusader specialty, which seems entirely comparable to the examples from Montfort, but certainly no later. The other bit of sculptural evidence is more unusual. Several of the pedestal blocks on which the column bases sit have floral design, what Johns calls "a sprig of leaves, perhaps oak or clover."[469] Whatever they are, they are quite abstract; rather flat and linear in design, but a notable refinement not seen at other sites. They reflect the strength of the more abstract Romanesque tradition; at the same time they demonstrate the new interest of Gothic in combining a rich array of foliate sculptural decoration on the various elements of the architectural ensemble.

This brings us to the matter of the plan of this church. Simple as it is, it has not only a parallel with aspects of St. Sophia noted earlier, but also with the plans drawn by Villard de Honnecourt in his sketchbook. Although neither of Villard's

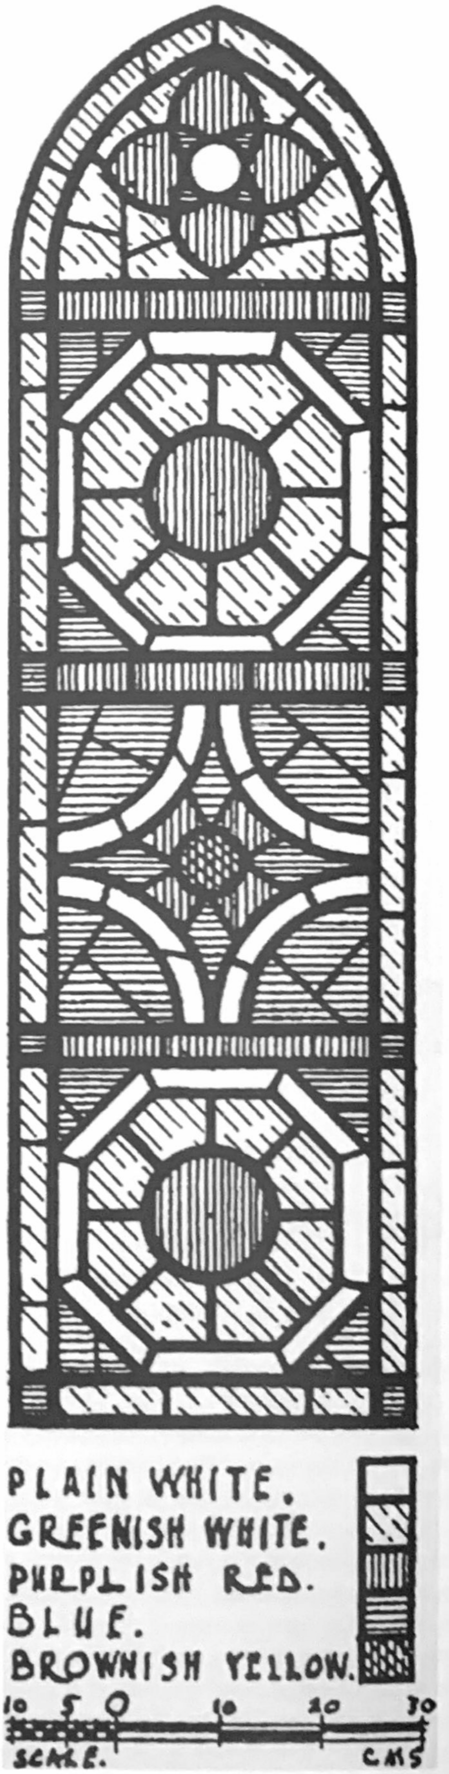


102. 'Atlit, Selection of Capitals from the Town Church. (photo: after Johns)

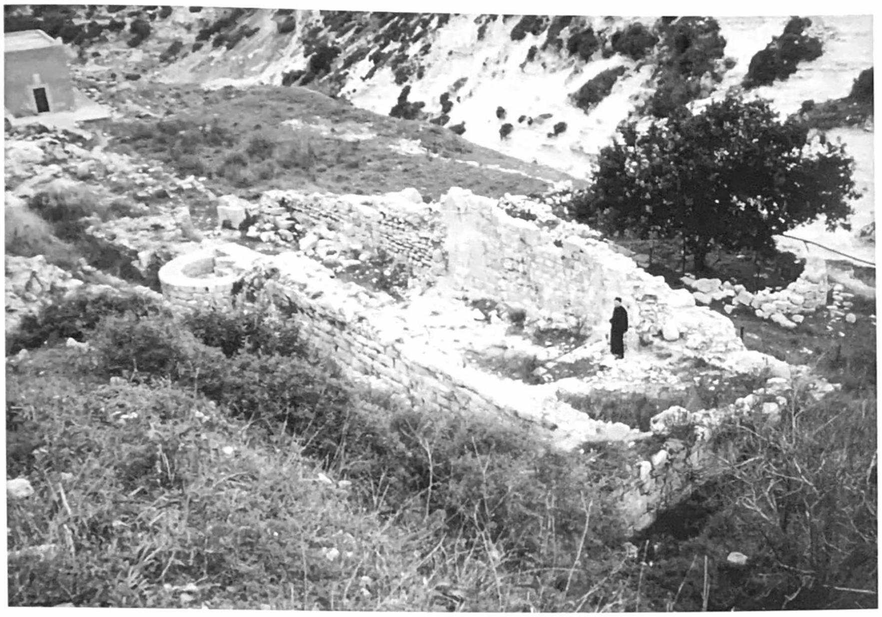
examples are exactly the same as the 'Atlit plan, two of his designs are relevant. The plan of St. Stephen in Meaux has the polygonal apse with seven sides, as well as the same handling of the external buttresses.[470] The plan of Cambrai Cathedral also incorporates these ideas, although the axial apsidal chapel is larger and there are other differences.[471] Villard's sketchbook also contains drawings of rib profiles and column base plans,[472] which are relevant to 'Atlit, not in any specific way, but generically as parallels to what we find here in the Latin Kingdom.

What then can we conclude about the date of this parish church?

Clearly the remains are fragmentary, and the fact that the church is unfinished is puzzling and cannot yet be explained on any historical or archaeological basis.[473] However, the *comparanda* introduced earlier, with the Cenacle and the examples from the Ile de France and Burgundy, help us to see that the Gothic ideas incorporated in the church at 'Atlit constitute a selection ranging from the 1180s to the 1220s or 1230s. The limited *comparanda* we have from the mainland Crusader States and Cyprus are important, because they more than anything else enable us to understand part of the developments that shaped the 'Atlit church in the Latin East. With these considerations in mind, the 'Atlit parish church appears to have



103. 'Atlit, Reconstruction of a stained glass window from the Town Church. (photo: after Johns)



104. St. Mary of Carmel/modern St. Brochardus: View with Father Elias.

been done in the late 1230s or early 1240s, well before the decision was made to rebuild and enlarge the castle chapel with its relics of St. Euphemia.

St. Mary of Carmel (Figs. 104–105)

Two other architectural projects worth noticing appear to belong to the first half of the thirteenth century, one carried out by the order of the Carmelites and the other by the Hospitallers. The new Carmelite order was of course founded on Mount Carmel, the mountain that separates the coastal plain, where 'Atlit is located to the south nearby, from the Bay of Acre to the north, what is known today as the Bay of Haifa.[474] The first certain indication that Latin hermits were living in the Wadi as-Siyah on the western side of Mount Carmel occurs between 1205 and 1214. It was during that time, on land that had come back under Frankish control after the Third Crusade, that the saintly Albert, patriarch of Jerusalem, had recognized these monks by giving them a "form of life" in 1214.[475] By this act – the beginnings of their rule – these hermits formed a

religious community with an elected prior, which was eventually approved by Pope Honorius III (1226) and emended by Gregory IX (1229).

By the 1230s, this community began to appear in various pilgrimage texts. In 1231, "Les Pelerinaiges por aler en Iherusalem" records the following:

> Near that abbey of St. Margaret[476] on the edge of the same mountain there is a very beautiful and delightful place, where there live the Latin hermits who are called the Brothers of the Carmel and where there is a small Church of Our Lady; and throughout this place there is a profusion of good waters which issue from the very rock of the mountain.[477]

The church of the "frères du Carme," named in honor of Our Lady, mentioned in this text has been referred to by certain travelers and scholars as St. Brochardus in modern times.[478] Brochardus was the hermit who petitioned Albert for a rule and he may have founded this site, but so far as we know his name was never given to this church in the medieval period. It was used this way only later, by travelers in the postmedieval period, but the pilgrimage texts in the thirteenth century consistently refer to the new church as being dedicated to Our Lady.[479]

The thirteenth-century Church of Our Lady is located at the eastern end of the monastery precinct, of which very little remains.[480] The church itself is a very simple rectangular structure of four bays, approximately 25 meters long; two of the bays survive from the early thirteenth century, and two from the later thirteenth century. The walls that remain stand to a maximum height of about 3 meters, and there is the base of a cylindrical tower on the southeast side. The original two bays measure about 5 × 6.5 meters each. It is not known whether the church had an apse on the east end, or was terminated by a flat wall. This phase of the building can reasonably be dated to the period 1205–14 when Patriarch Albert instructed Brochardus to build an oratory where mass could be celebrated daily in the midst of the cells where the hermits lived.

The second phase of construction of the church must have taken place some time after 1247 when the Carmelites held a general chapter in England where a prior general was elected and members of the order were, among other things, instructed to eat in a common refectory. It is presumably in the years after 1247 that the community here in the Wadi as-Siyah erected the communal buildings that constitute what we call the Monastery of St. Mary of Carmel. At this time the church was given two additional bays, somewhat more squarish, and the whole interior was apparently revaulted. The old pilasters were used in the two western bays, but new clustered shafts were installed in the two eastern bays along with all new ribs. Unfortunately none of the rib voussoirs survive, but Pringle says that the design of the new shafts on the side walls suggests early Gothic design. The walls of the new part of the church are even thicker than the old walls in parts and the east wall is again completely flat.

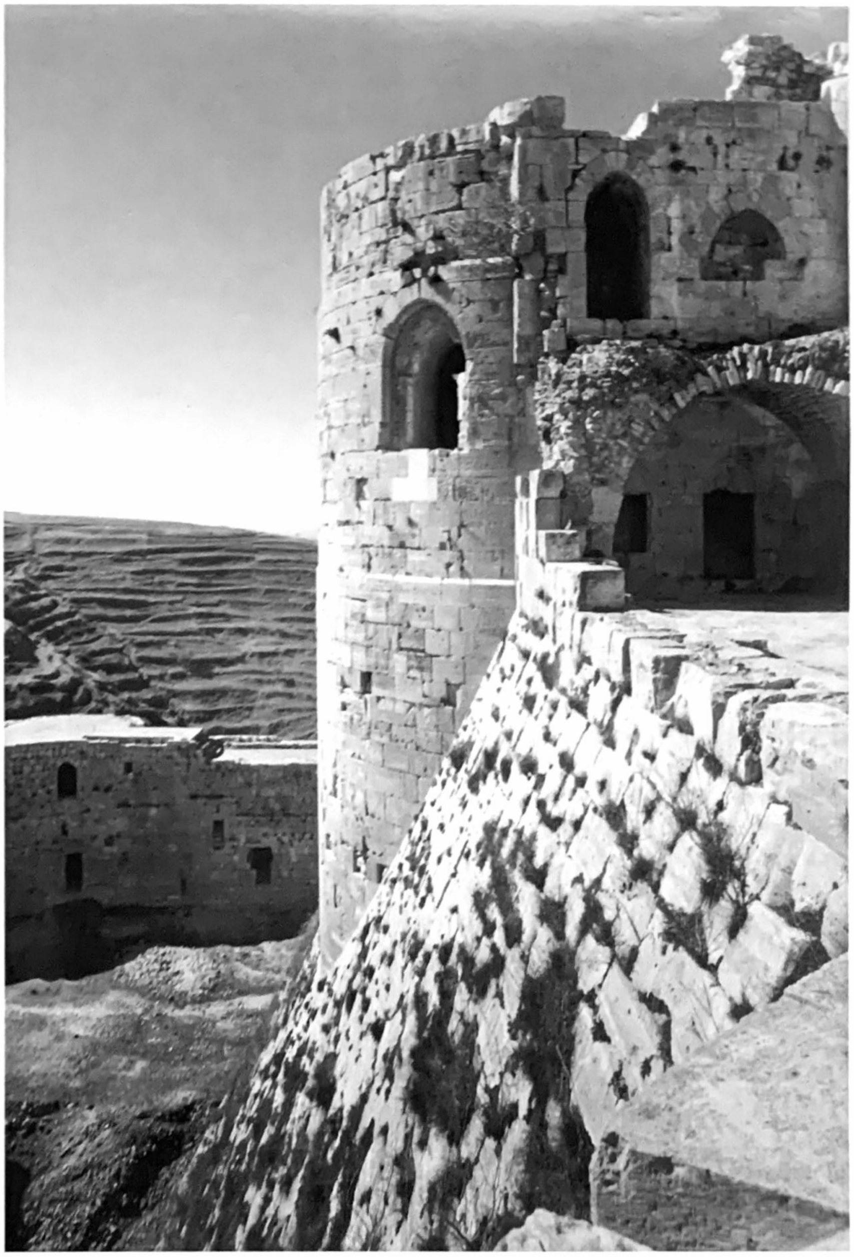
Almost nothing survives in the way of column bases, shafts, capitals, archivolts, or bosses, if there were any of the last mentioned. There is only one extant sculptural work with foliate decoration, but it is part of a stone tank or possibly a sarcophagus and is not apparently part of the fabric of the church. Nonetheless this church provides valuable evidence for Crusader architectural developments in the Latin Kingdom. It shows us that again an extremely plain church building could be given certain basic Gothic elements in the form of pilasters and rib vaulting by 1214. Furthermore, this rather austere version of Gothic could be retained after 1247 for monastic use when the church was expanded, probably in the 1250s or early 1260s. Compared to the town church at 'Atlit or the chapel at Montfort, this building was, of course, built for a different purpose and a different clientele. What is Gothic about it is quite limited and focused on its vaulting system.

By comparing this church with the cathedral at Tortosa, one phase of which was presumably being worked on in some of the same years after the earthquake of 1202, we can begin to appreciate the wide range of possibilities for what we are calling Gothic in churches built in the Crusader States. There is a huge stylistic gulf between the most simplified Gothic here at Our Lady of Mount Carmel and the most sophisticated work being done in Nicosia on the Cathedral of St. Sophia before 1228, but both are legitimately called Gothic churches in the Crusader East.

Crac des Chevaliers (Figs. 106–108)

Farther to the north, in the County of Tripoli, the Hospitallers continued their work on the great castle of Crac des Chevaliers. As part of the refinements introduced into the castle architecture in the later phases of work, we find handsome decorative sculpture carried out in the great round tower on the southwest corner of the inner ward,[481] designated by Deschamps as tower "K." Although phases of architecture in the great castles are notoriously difficult to date, in this case Deschamps himself specifies the dating here as "1230–1240."[482] He says that whereas the tower itself was done earlier, as part of the strengthening of the castle along the south side in the early thirteenth century after 1202, the transformation of one chamber in this tower was effected to become the residence of the commander. Here there was a beautiful round vaulted room known as "le Logis du Maitre." He identifies this as the living quarters of the commander of the castle and also served the grand master when he was in residence.[483]

Originally designed with arrow slits, this room, one storey above the level of the esplanade, was renovated in the 1230s primarily in three ways. First, the arrow slits were filled in and a very large and handsome pointed-arch window was installed facing south, from which the occupant could not only look over the south end of the castle and the hills and valley beyond, but also he could receive the breeze to ventilate his handsome chamber.[484] Such a large window with a panoramic view from one of the residence halls was truly unusual in any of these Crusader castles. Second, whereas according to Deschamps, ogival rib vaulting had not been used at Crac prior to this time, this completely round chamber was given elegant ribs springing from four stocky engaged columns with foliate capitals around the interior. The four-part circular vaulting was made up of webbing laid in the French horizontal mode, and the ribs were configured with a profile that appears to be comparable to the example found at the chapel at 'Atlit.[485] Third, a program of simple but very elegant foliate and floral sculpture was applied to the interior of the chamber and to the



106. Crac des Chevaliers: the Logis du Maitre. (photo: Anthony F. Kersting)

large window. The foliate components found on the capitals are somewhat flat and abstract versions of a type of capital we see at 'Atlit with flowers on larger leaves, but on a taller and more slender drum.[486] The important floral unit is a rosette consisting of five petals with a *bouton* in the center. Inside we find a series of these rosettes running on the chamfered underside of a heavy molding that articulates the chamber at the level of the springing of the vaults. The flowers seem to run continuously around the room, "behind" the capitals, and at the window they form a hood molding for the interior of the window arch. On the exterior of the window, a double series of these flowers also appears along the chamfered surfaces from the sills to the keystones of the stepped back opening. One can only imagine how impressive this room would have looked with this understated though surely painted sculptural decoration, in contrast to the austere simplicity of other residential rooms in the castle. (Figs. 106, 107, 108)

Besides tower "K," tower "J" was apparently also both a military and a residential tower with large rooms and mullioned windows on the north façade looking out over the courtyard of the inner ward. This façade has three pairs of double windows with mullions, and two single windows below. The two upper double windows are also decorated with round foliate decorative sculpture, which resemble the bosses we have seen at Montfort and 'Atlit, but the work on this tower may be modern restoration.[487]

The continuing work at Crac des Chevaliers is evidence for a fundamental fact that these castles had to be maintained and repaired constantly, and on some occasions renovations were carried out, occasionally with sculptural refinements. The case of the Logis du Maitre at Crac is a remarkable example of such renovations, one in which it was possible to introduce a program of decorative sculpture. We have already seen decorative painting at Crac from an earlier phase of work in and around the chapel. One additional major campaign of work took place at Crac a few years after the Logis du Maitre project was completed in the 1240s, when the Hospitallers decided to renovate and decorate their great hall, including a rib-vaulted loggia at its entrance along the inside of the courtyard. We shall discuss this major addition when we discuss the architectural activity in the Crusader States during the time of King Louis IX in Chapter 6.

Conclusions on Architecture in the Period 1225–1244

This selection of architecture indicates some of the wide range and impressive amount of Crusader construction in these years, but it is only a selection of the most important work. The extant condition of some of these projects also gives us some idea of how difficult it is to "see" a coherent picture of Crusader architectural development in this period. We can conclude our consideration with a few pertinant observations to help further contextualize these works for the period 1225–44 and to remind us of the major problems that currently exist in the study of these monuments, whether castles, cities and city walls, or churches.

First, it is evident that there were no major projects on the great pilgrimage sites of Jerusalem and Bethlehem, which were now lost for good by August 1244, or for Nazareth, which still remained in Crusader hands. Nonetheless there was work on one other major pilgrimage site, at the Cathedral of Notre Dame in Tortosa. Even though the Tortosa project cannot rival the huge amount of work carried out at the Church of the Holy Sepulcher in Jerusalem, or the Church of the Annunciation at Nazareth in the twelfth century, it is an indication that Crusader ecclesiastical architecture was dynamically growing by continuing to adapt the new Gothic style to the needs of holy sites in the first half of the thirteenth century.

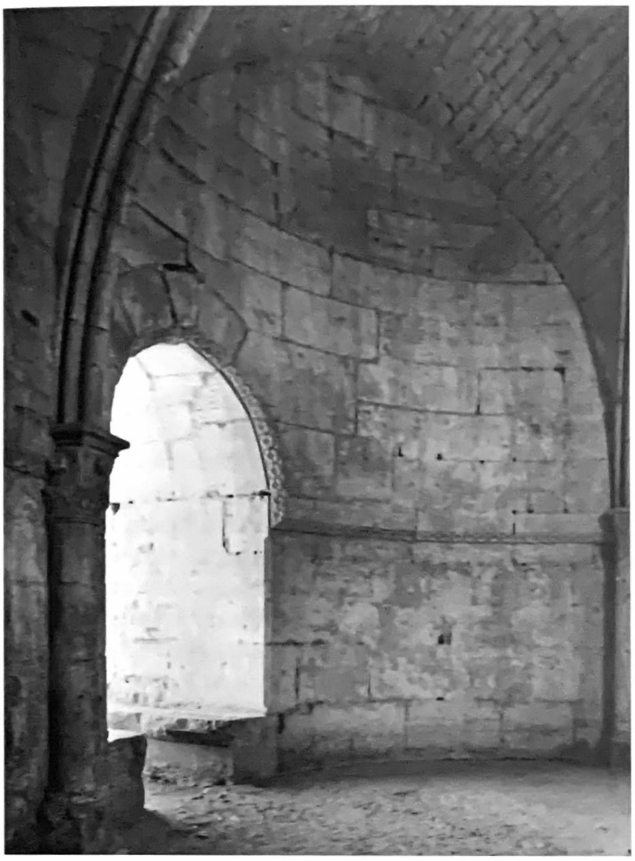
Second, the amount of Crusader architectural activity is difficult to assess in this period for several reasons. To some extent it is not because there was so little, but because there was so much Crusader work being done. Most of this activity was devoted to military fortifications such as the castles, but indeed a great deal of work was also done on the walls of major cities. We can recall that the Muslims destroyed many city fortifications in 1219, including those of Jerusalem. The walls of the Holy City were never rebuilt in the thirteenth century, but Caesarea and Jaffa had their fortifications reerected in the spring and fall of 1228, respectively, as a direct result of the advent of Frederick II. The other major town to have its walls reerected was Ascalon, yet again,[488] as a benefit of the coming of the Crusades of Thibaut de Champagne and Richard of Cornwall between 1239 and 1241. However, once again, these defenses stood only for a short time, because in 1247, the victorious Ayyubid sultan Ayyub dismantled the fortifications as we have seen. A further reason that Crusader architectural activity is difficult to assess between 1225 and the 1240s is that despite enormous activity in certain sections of the Crusader States, very little survives readily accessible to open inspection and very little relevant material has been excavated as yet by which to assess the developments step by step. Take, for example, the 40-kilometer-square area due east and north of Acre, which includes the major city of Tyre,[489] and the major castles of Montfort, Safed, and Toron, as well as the castle of Judin, all with major construction done in this period. If the Crusader structures in those sites were in better condition, and we knew the details on the church buildings and the fortifications in those places, we would have a much clearer picture of how Crusader architecture developed after 1225 and prior to the arrival of Louis IX in the Holy Land!

Third, it is evident that there were many patrons involved in the Crusader building activities, whether military or ecclesiastical. These patrons range from Crusader leaders like Thibaut and Richard, to the military orders like the Templars at 'Atlit and at Safed, the Hospitallers at Ascalon and Crac des Chevaliers, and the Teutonic Knights at Montfort, and to the new religious orders like the Carmelites. What we can clearly see is that, like Crusader military and ecclesiastical projects in the past, the specifics of the site, current needs, the function intended for the structure, and available resources played important roles in determining what would be built in any particular situation and how it would be designed and decorated.

Fourth, despite the fact he personally led the refortification of Jaffa and Caesarea in 1228 during his Crusade, Frederick II does not appear to have been a major architectural patron in Jerusalem during his stay there in March 1229. In the past various attempts have been made to see his hand behind the proposed refortification of the Tower of David in the Citadel,[490] in the renovation and rebuilding of the *Coenaculum* in the Church of Saint Mary Mount Sion,[491] or in major programs of architectural sculpture relating to Jerusalem and elsewhere.[492] None of these proposed interpretations has been borne out by later research, however. Rather surprisingly therefore, despite his remarkable political achievement in successfully arranging the Treaty of Jaffa in 1229 that reopened the Holy City to Christian access, we must conclude, on the basis of our current understanding of developments in the Latin Kingdom, that Frederick II was not a major force in the artistic activity of the Crusader kingdom – in architecture and architectural sculpture – during his short period in the Latin East. It remains to be seen to what extent his presence is felt in other media.

Fifth, despite the problems mentioned earlier, there were some important new developments in military architecture as we have seen, which included the increase of defensive strength through the use of round towers, impressive taluses or glacis construction, and expanded installation of machicoulis on the heavily fortified battlements. There were also vaulted halls, some using the new Gothic rib vaulting to enhance the ambience of these sometimes forbidding structures. In churches and monasteries there was also the introduction of Gothic arches for portals, windows, and halls, rib vaulting, and decorative sculpture, including foliate and figural carving on capitals and bosses, along with the vaulted halls. Fortunately some of the most remarkable Crusader work survives in castles like Crac des Chevaliers, which have survived largely intact, providing us with a solid indication of the admirable fortification work the Crusaders could achieve at this time.

In regard to ecclesiastical commissions, we are poorly served by having so little sponsored by the new orders to have survived. St. Mary of Mount Carmel is an extremely modest example of what the Carmelites were building. Nothing of theirs nor anything of the Franciscans or the Dominicans is known to be extant in Acre, which is a great loss and a huge gap in



107. Crac des Chevaliers: the Logis du Maitre, interior. (photo: Anthony F. Kersting)

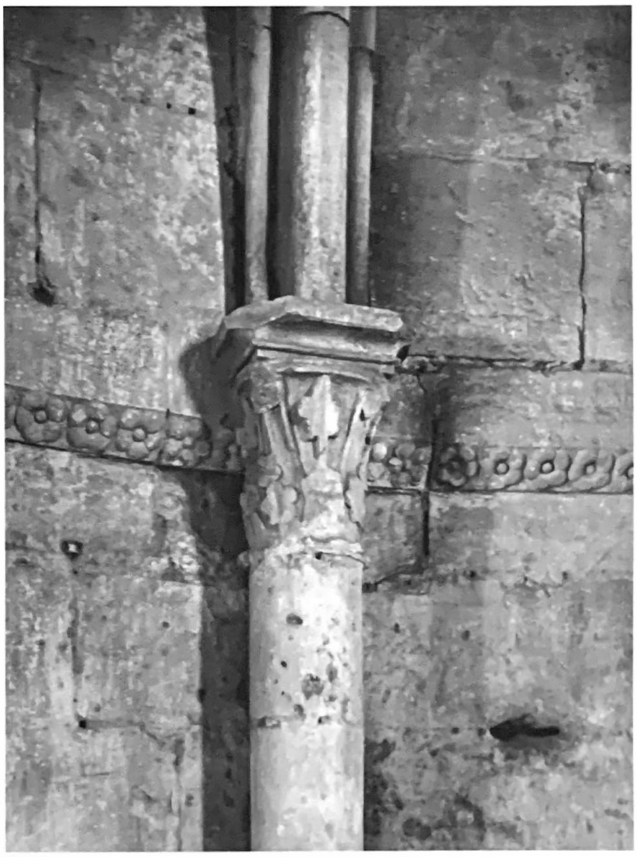
our knowledge, however modest and unassuming their initial projects may have been. It is interesting, however, that we see the Teutonic Knights possibly interested in round chambers – the chapter house at Montfort – and the Hospitallers building a rib-vaulted round chamber for their commander's residence at Crac des Chevaliers, both projects indicating new interest in this form of architecture done before the Templars produce their examples. The Templars subsequently build round chapels, first apparently at Safed and then, shortly thereafter, what has come to be their best known chapel – albeit in ruins – with this centralized plan vaulted construction, in the formidable castle at 'Atlit probably *c.*1250, the latter to be discussed later. It is also interesting to see the Cathedral of Tortosa finished: a Crusader levantine Romanesque church in origin with Gothic formal vocabulary in its final phases between 1202 and the 1220s. This demonstrates how flexible Crusader ecclesiastical architecture could be in the individual circumstances that called it into being.

Finally, it is a commonplace of Crusader studies that the castles and other work of fortification, especially city walls, have not been given the attention they deserve in order to inform us with evidence for a more detailed historical picture of architectural developments in the Crusader States between 1225 and the 1240s. It is important to identify and differentiate that work done during the time of Louis IX from the significant architectural projects that preceded his arrival. We have found in this discussion that, perhaps surprisingly, there was a great deal of work done between 1225 and the 1240s, some of it executed in Gothic architecture of varying degrees of sophistication. Making the identifications and the differentiations has often been difficult, and the arguments have sometimes been incomplete or circumstantial at best. Certain aspects have been surprising, including the fact that we have not been able to associate any major work with some of the most prominent political and military figures in the Crusader East during this period, that is, Frederick II, John of Ibelin, or two of the major new religious orders, the Franciscans and the Dominicans. However, it is clear nonetheless that much work preceded Louis IX; we need to know more clearly what it was, and how Gothic architecture developed in the Latin Kingdom between its earliest manifestations in the late twelfth century and 1250. The Crusader architecture produced between 1225 and the 1240s is crucial to our understanding of these developments.

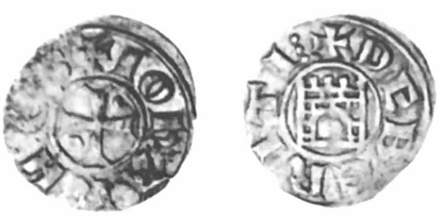
COINAGE, SEALS, AND METALWORK

Coinage

There are comparatively few new coins issued in the Latin Kingdom, in Tripoli, or in Antioch during the years 1225–44.[493] Furthermore, assessing the coinage in these years is difficult, although there are some major coin hoards with evidence for this period. It appears evident that a number of immobilized coin types continue to be struck, especially the Amalricus deniers in the Latin Kingdom and the helmet deniers at Antioch, but there are a few notable new developments as well. Because of the shift of the crown of Jerusalem to a nonresident king, in the persons of Frederick II in 1225–8, and his son, Conrad, from 1228 on,



108. Crac des Chevaliers: the Logis du Maitre, interior (detail). (photo: Anthony F. Kersting)



109. Beirut, denier of John of Ibelin. (photo: after Slocum catalogue)

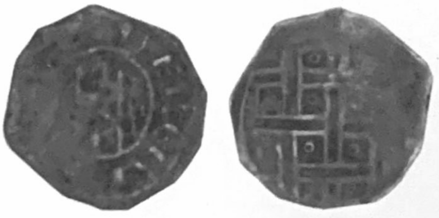
we see no new royal Crusader coins in the Holy Land as such, only the continuation of immobilized types. Frederick II does in fact introduce new gold seals, which refer to him as king of Jerusalem, but these are relatively few and entirely Western in conception. In the context of increased interaction with the Muslims diplomatically, economically, and otherwise, we find the Crusaders continuing to use gold bezants imitative of Fatimid coinage in both the Latin Kingdom and the County of Tripoli. Furthermore, as one of the most interesting developments to be seen in this period, we observe the introduction of imitative silver drachmas based on an Aleppo coin type in the years 1216–40/1, and on a Damascus type in the years *c.*1243–50. Finally, whereas the royal coinage apparently wanes during the time of the civil war European currency is much in evidence, especially from France, with some from Italy, but surprisingly with almost nothing from Germany or England. Furthermore, baronial currency in the three main centers, Beirut, Sidon, and Tyre, appear, but the finds seem to indicate a somewhat erratic level of output.

Given their prominence in the civil war and the money they were forced to spend to support their own causes, it is perhaps odd that we do not have more coinage connected with the principals in this bitter struggle, namely, John of Ibelin and Frederick II. For John there are various types that had begun before 1225 in Beirut, most of which continue the typical Crusader-type denier with the cross on the reverse, and on the obverse an architectural motif, such as the crenellated tower with gateway (Fig. 109).[494] Other baronial coinage seems to feature variations of the architectural motif, both at Sidon[495] and later, in the late 1140s, at Tyre,[496] as well as farther north in Tripoli.[497] Only one coin seems to offer something distinctively new, namely, an anonymous copper issue probably struck by John of Ibelin in Beirut featuring the architectural motif of a fortified gateway on the obverse with an abstract interlace design on the reverse interspersed with annulets (Fig. 110).[498] It would be interesting to know whether this interlace motif owes anything to Islamic artistic sources.

Frederick II, despite the tremendous impact he had on the political situation in the Latin Kingdom, has a minimal presence in terms of the coins. This is surprising perhaps because it was just in 1231, less than two years after he had returned from the Holy Land after concluding the Treaty of Jaffa in 1229, but while the civil war in the Latin East was still underway, that he issued his handsome and famous *Augustale* in Italy.[499] This coin, with its strong neoclassical connotations, features the profile bust of the emperor as victor with the laurel leaf crown on the obverse, and has the imperial eagle on the reverse. It was Frederick's most impressive and best-known imperial coin, but apparently it has nothing to do with his experiences as a Crusader in the Near East. Strange to say, neither an *Augustale* nor any denier issued by Frederick as king of Jerusalem has ever turned up in the main Near Eastern hoards representing finds from *c.*1220 to the 1240s.[500] Oddly enough, despite the fact that Frederick aggressively claimed the title of king of Jerusalem, he issued no coin in the Holy Land with that title inscribed; he and his son, Conrad, only used it on coins issued in Sicily.[501] However, he did identify himself as king of Jerusalem also on certain gold seals that were issued in the 1220s, some of which may have been executed in the Latin East, but which depict him as emperor in purely Western imperial pose, throne, and regalia. His special gold seal was particularly impressive with a frontal, seated imperial figure in full regalia on the obverse and the following long inscription:

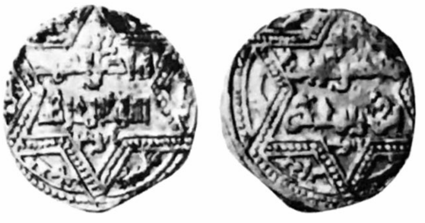
> Fredericus Dei Gratia: Romanorum Imperator et Semper Augustus et Rex Ierusalem et Sicilie.[502]

At least one of these gold seals was done in the Holy Land for the letter that Frederick wrote to the pope in 1229. Although this seal does not survive, we are fortunate to see it among two other examples that Matthew Paris illustrates in careful detail in his *Chronica Majora*.[503]



110. Beirut, copper of John of Ibelin. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)

Of the baronial types, the coins of Beirut are the most interesting, and John of Ibelin appears to have issued them in two denominations, billon deniers and coppers, from 1205 until his death (Figs. 109, 110).[504] The deniers have a fairly standard architectural image of a fortified central gateway on the reverse that appears in two variants: one with a large round arched gate flanked by two towers, each with three crenellations; the other with a small round arched gate and five crenellations above.[505] The coppers are fractional currency for the deniers. In the Beirut series they resemble the deniers in the citing of the name of the city and they also use an architectural motif; but they also differ, not only in the metal employed and their color, but also in moving the architectural image to the obverse from its position on the reverse of the deniers and the specifics of the architecture are changed. These Beirut coppers appear in three variations, all of which have a fortified gateway on the obverse distinct from that of the denier. Two of the types are anonymous, but the fact that some are overstrikes of the "Turris Davit" coinage from Beirut suggests they are early examples. The third type, which may be the last of the series of three, has the name "+DEBERITOIOHE," John of Beirut. It also has the same fortified wall with a central tower, but the tower has only three crenellations and the round arched gate is smaller and placed to the left side, as a kind of postern gate, not a large centralized main gate in a tower with four crenellations, as in the two earlier types. Metcalf has suggested in light of the asymmetrical placement of the gate on type three that it "may depict a particular, real gate."[506]



111. Acre, dirham of al-Zahir. (photo from Hazard, Harry W. and Norman P. Zacour, *A History of the Crusades*, vol. VI, copyright 1990, reprinted by permission of the University of Wisconsin Press)

The "fretted design" on the obverse of the coppers is intriguing, one that by both its rectilinear interlace pattern and its strong geometric character suggests parallels with Muslim wood inlay work or metalwork. Although in its Muslim manifestation this type of design would most likely appear with a diagonal orientation,[507] it appears in its Crusader version here to be an abstract rectilinear rendition of the conventional cross motif found on the billon deniers. It is interesting that the designs vary; one version has the unbroken vertical cross element, but the other has the unbroken central cross element on the horizontal.[508] Despite these variations and the existence of both deniers and coppers, the number of Beirut coins struck by John of Ibelin appears to have been relatively few, based on the extant finds, indicating that this coinage was probably used mainly for local currency only.[509]

In some ways the most interesting coins from the Latin Kingdom in this period are the rare silver drachmas and the more plentiful half drachmas, which imitate dirhams issued from Aleppo and Damascus. Although it is not certain where these two early series were minted, it is likely the Crusader imitations were minted in Acre, which was the main trading center as well as the de facto capital of the Latin Kingdom.[510] The earlier series appears to have been struck between 1216 and 1240/1 on the model of the Ayyubid ruler of Aleppo, al-Zahir Ghazi (Fig. 111).[511] Al-Zahir Ghazi was the son of Saladin who ruled Aleppo from 1186 until he died in 1216 (AH 582–613).

The imitations are very skillfully done, but on the basis of careful analysis of the dates in the inscriptions, the type of coin in relation to its dies, and the metrology and the alloys of the coins,[512] numismatists can identify the Ayyubid originals as distinguished from the Crusader copies. The Aleppo coin features a hexagram or six-pointed star of the "Seal of Solomon" type on both the obverse and the reverse, both containing identifying inscriptions in Arabic. On one side is found al-Zahir's name and titles, while on the other side are found the names of his overlords, Sultan al-Adil and Caliph an-Nasir. The Crusader imitation gives al-Zahir-type coins dates that fall after his death in 1216. Bates proposes the thesis that these imitative dirhams came into existence because al-Zahir was allied with the Crusaders in the early thirteenth century, and according to the terms of a treaty with the Venetians in 1207/8, "Venetian merchants could have access to the mint at Aleppo to have coins struck from any silver bullion they might bring to the city."[513] When al-Zahir died and the alliance had ended, the Crusaders, or possibly the Venetians, continued to make these coins. In any case, he interprets these coins to be intended for circulation with genuine Ayyubid coins for trade between the Latin Kingdom and the contiguous Muslim states.

The second series of Crusader imitations is based on the Damascus coinage of Sultan as-Salih Ismail and dates from 1240/1 (AH 641) (Fig. 112).[514] Bates proposes that again a specific historical event precipitated the changeover. In 1240 the Crusaders briefly entered into an alliance with as-Salih Ismail, under whose terms they were permitted to come to Damascus to purchase arms and supplies.[515] Aleppo imitations were apparently used for this expedition, but the Crusaders no doubt readily discovered that the al-Zahir coins were out-of-date, so they began to produce equally careful imitations of the current Damascus coinage of as-Salih Ismail. These new imitations begin in 1240; they have the main inscriptions inside a square enclosed by the rim of the circle of the coin. On one side there is the name and titles of as-Salih Ismail, with other information (date and mint location) in the segments outside the square. On the other side is the name and titles of the caliph al-Mustansir and Muslim professions of faith in the segments. Again, the Crusaders issued these coins between 1240 and 1246, for which Bates has analyzed four types.[516] Again here, these silver coins were issued to circulate between the Latin Kingdom and the contiguous Ayyubid states of Damascus and Egypt among others. This differs fundamentally from the gold bezants minted by the Crusaders in imitation of Fatimid dinars, which were intended to be a currency separate from the Muslims for use within the Crusader States and with other Christians in the Near East.[517]

One of the mysterious aspects of coinage in the Latin Kingdom is the presence of large numbers of feudal French coins in the first half of the thirteenth century, and the conspicuous absence of very many examples from anywhere else. We know for one thing that the Crusaders were not melting down foreign currency in the thirteenth century the way they had before 1187. In addition given the fact that the Latin Kingdom was financially in a very strong condition after the Third Crusade, when Acre and Tyre enjoyed a certain commercial prosperity,[518] at least up to the defeats of 1244, it is puzzling why mainly only French coins are found. Although French coins predominated, as they had in stray finds from the time of the First Crusade, their numbers must be explained by some kind of economic phenomenon – Metcalf has suggested a balance of payments surplus in favor of France.[519] Metcalf notes also the curious lack of other Western coins in relevant Near Eastern hoards when there must have been a number of German pilgrims and there certainly was vigorous trading going on with Italian merchants in all the major Crusader port cities. This suggests that the Teutonic Order may have been serving the German Crusaders and pilgrims, the way we know the Templars served as bankers for others,[520] and that Italian merchants may have

carried on their business by means of credit transactions to a much larger extent than the French.[521]

Finally, in Cyprus King Henry I pointedly avoided issuing any coins that resembled those of Frederick II. Instead he followed the lead of his predecessors, Guy de Lusignan and Hugh I, by issuing Byzantine-style bezants and deniers with the typical Crusader program of a cross on the reverse and an architectural motif on the obverse.[522]

The coinage of the Crusader States has proven to be an important if selective bellweather of economic, cultural, and artistic developments throughout the period of Frankish presence in the Near East. In the years 1225–44 it is truly fascinating to see the amazing variety of architectural motifs that appear, most very similar to each other, but all diversified by certain special characteristics. Not only do these motifs of fortified towers, walls, and gates on the coins genuinely continue a Crusader tradition of architectural imagery seen earlier, but they also reflect the fact that a great deal of the Crusader construction in this period was focused on massive fortifications for cities and castle building, in terms of either new sites or rebuilding already existing fortresses. The fact that some of these coins imitate Muslim prototypes, either new examples or continuing types known from the twelfth century, and others seem to show clear sensitivity to, even careful study of, Muslim design is a telling aspect of how much the Crusaders, economically as well as politically, militarily, and diplomatically, while interacting with their Muslim adversaries were also becoming involved in some of their cultural forms. The increase in the Muslim impact on Crusader coins seems to be one important indication of how life and art in the Crusader States were changing between 1225 and the 1240s. The importance of French coinage in the finds of relevant coin hoards is perhaps most surprising only in the context of the comparative lack of other Western issues. The fact is, the French presence seen in the coinage in this period would only increase in the coming years as French influence grew stronger in other artistic media as well.

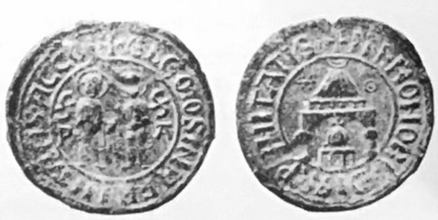
Seals

We have already mentioned the remarkable golden seals of Frederick II, which although totally Western in design do carry a reference to the king of Jerusalem. At least one of these seals must have been used in the Latin Kingdom.[523] Other seals found in the Latin Kingdom during this period are more closely tied to the Crusader East. Schlumberger publishes a single seal of John of Ibelin, lord of Beirut, which has a castle on the reverse with the inscription, "Castellum Civitas Berity," in the manner of his coinage as well.[524] On the obverse there is an armed knight brandishing a sword, reminding us of the widespread imagery of the Crusader as soldier, often riding a galloping horse, from the twelfth-century seals.

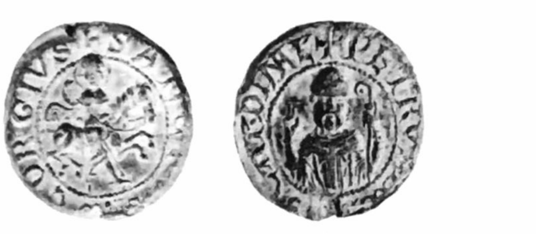
There seem to exist significantly more ecclesiastical than secular seals in this period, including those of Gerold of Lausanne, patriarch of Jerusalem (Fig. 113). In the same way that John of Ibelin follows a conservative tradition in the design of his seal, so Gerold employs the familiar "Anastasis" iconography of the Church of the Holy Sepulcher on the obverse. This imagery was seen already in the twelfth century on the seal of the patriarch Heraclius.[525] Similarly in Antioch, the Latin patriarch there, Albert (1226–45), retains the traditional pairing of St. Peter on the reverse and himself as patriarch on the obverse,[526] thereby harking back to the Latin petrine origins of the see of Antioch and the imagery of its early coinage during the Crusader period.

It is also notable that many seals exist from this period, or from slightly later, for religious institutions in Acre: monasteries, convents, priories, and abbeys, institutions – like the patriarch of Jerusalem – that in many cases had relocated in the capital city after Jerusalem was lost in 1187.[527] Among these the most topical and intriguing for us is perhaps the seal of the confraternity of St. André (Fig. 114).[528] It was this organization that formed the basis for the commune of Acre, which came into existence in 1232. The confraternity seal featured the standing images of Sts. Peter and Andrew on the obverse with an inscription, "+Elemosina Fraternitatis Acco," which thereby focused on the *raison d'être* of this organization. On the reverse we find an image of the Holy Sepulchre surmounted by the rotunda, referencing the holiest of the holy sites in the Latin Kingdom, a site made accessible under the Treaty of Jaffa in 1229. The mystery is whether the commune of Acre, which existed from 1232 to 1243, also had its own seal, for documents issued under its corporate authority, and if so whether it was related to this seal.

Finally, one seal from this period that is not Crusader, but may show Crusader influence in Rome, is worth mentioning. A seal of Peter Capuano, cardinal deacon of St. George (Fig. 115), came on the market in 1999, which shows a frontal bishop on the reverse and a mounted figure of St. George on the obverse.[529] It is quite interesting that the image of the mounted George is dressed as a Frankish knight with chain mail and spurs on a spirited galloping horse just as we see in certain Crusader icons. We may wonder how and why Peter chose this



114. Acre, Seal of the Confraternity of St. Andre. (photo: after Prawer, *Histoire du Royaume Latin*)



115. Seal of Peter Capuano, Cardinal Deacon of St. George, elevated by pope Honorius III or Honorius IV. (photo: after Spink auction catalogue 132)

image on his seal and to what extent it may reflect Crusader imagery from the Latin East.

In sum, the seals extant appear to affirm a conservative effort to retain traditional forms during a period characterized by dramatic political and military change. It is perhaps not surprising to find that Frederick II staunchly retains his own imperial design, which in seals as in politics reflects his policy of forcefully imposing his will on those he dealt with. It is a bit more surprising to find that otherwise the seals from the Crusader States were to some extent more traditional and less experimental in their imagery than the coins, reversing a relationship we found to exist in the twelfth century.

Metalwork

The situation with metalwork in the Latin Kingdom is, as usual, more difficult to assess than the coinage or the seals. We know of many major pilgrims, as noted earlier, a number of whom apparently took important relics home, some of which must have been protected in metal reliquaries. We know what some of those relics were said to be, especially the more celebrated relics that went to England, although we know very little about the metal reliquaries. There was the Holy Rood of Bromholm, the imprint of Christ's Holy Foot at Westminster, and especially the relic of the Holy Blood, which King Henry III personally carried to Westminster in procession in 1247. Matthew Paris illustrated all three of these relics in either his *Chronica Majora* or elsewhere.[530]

The Holy Rood of Bromholm apparently arrived in England before 1223 from Constantinople, carried by the English chaplain of the Latin Emperor, Baldwin I.[531] Its origin before that is not known; the question is "did it come from the Holy Land during the time of the Crusaders or was it a relic of the True Cross that had resided for centuries in Byzantium?" What is significant for us in this period 1225–44 is that it is clearly a double-armed cross, an image of the True Cross as the Crusaders had celebrated it in the twelfth century prior to the battle of Hattin. The story of how it came to the priory at Bromholm after monks at the Monastery of St. Albans doubted its authenticity is as remarkable as is its efficacy as a miracle-working relic. Between 1226, when King Henry III made his first pilgrimage to Bromholm, and 1248, it was frequently visited by prominent pilgrims and made the object of generous donations. We know of its configuration because of imagery that survives in the *Chronica Majora* of Matthew Paris, and its appearance on the seal of Bromholm Priory.[532] It is significant that just as interest in the relics of Christ's Passion was building in western Europe, stimulated by the surge of relics sent westward after the sack of Constantinople in 1204, the image of the True Cross again becomes a central focus. It also raises the question to what extent the goldsmiths in the Crusader kingdom were again active, perhaps in Acre, or even in Jerusalem while it was open and accessible to Christian pilgrims, that is, between 1229 and 1244.

The imprint of Christ's Holy Foot, the *Passus Christi*, came to England later, in the 1240s, in the hands of the Dominicans. Matthew Paris describes this relic as follows:

> About this time [1249], too, the Dominican friars brought to England a stone of white marble, which had been in the Holy Land since the time of Christ and which bore the impression of our Saviour's foot on it, which, as if it were made of soft wax, plainly showed the form of half a human foot. The inhabitants of the Holy Land declare this impression to have been the footprint of Christ made when, ascending to heaven, he took leave of his disciples, in order that this sign might perpetuate to his disciples the memory of him at whom they gazed for the last time and whom they would not see until he would come again to judge the world. In the same way also, Christ is said to have made the impression of his face, which he is reported to have done for St. Veronica, that his memory might be cherished on earth. The king presented this noble gift to the church of Westminster, as he had lately done with the blood of Christ.[533]

This story is important because first, it links the relic directly with the Holy Land and the holy site of the Ascension on the Mount of Olives, where the imprint of Christ's foot is said to be visible even today. Jerusalem is, of course, a holy city that preserves other holy imprints, in particular that of Muhammed on the rock under the Dome of the Rock. The story of the *Passus Christi* suggests that this imprint had been acquired by the Dominicans before the Holy City was lost in 1244. One wonders how an imprint like this could have been authentically duplicated, but Matthew Paris explains this in regard to the original with reference to the veil of Veronica and the miraculous image of Christ "not made by human hands." The relic was mounted with silver, again metalwork possibly done by the gold- and/or silversmiths of the Latin Kingdom.[534]

For the Holy Blood of Christ, Matthew Paris records the story of its reception by King Henry III at some length, and provides an illustration of the king carrying the vessel with the precious substance to Westminster.[535] Matthew Paris writes:

> About the same time [1247] the king wrote to all the nobles of his kingdom, ordering them to assemble [in London] on the feast of St. Edward . . . to hear the most agreeable news of the holy benefaction lately conferred by heaven upon the English. . . . The master of the Templars and Hospitalers, with the testimony of a great many seals, clearly those of the patriarch of Jerusalem, of the archbishops and bishops, of the abbots and the other prelates and important persons, had sent a portion of the blood of our Lord, which he shed on the cross for the salvation of the world, enclosed in a handsome crystalline vessel. . . . And the king, as a most Christian prince, had obtained it from the . . . emperor, following the example of the then living French king who was bestowing all honor at Paris on the [relic of the] cross. . . .
>
> The king then gave orders that all the priests of London should assemble . . . dressed for a feast . . . attended by their clerks also appropriately clad, and with their symbols, crosses, and lighted tapers. The king also went thus and, receiving the vessel containing the aforesaid treasure with the greatest honor, reverence and awe, he carried it above his head

> publicly, going on foot and wearing humble dress.... Nor should it be overlooked that he carried it with both hands when he came to any rough or uneven part of the road, but always kept his eyes fixed on heaven or upon the vessel itself. The canopy was borne on four spears.

After the procession had reached Westminster, a sermon was preached on the Holy Blood of Christ. Then Matthew Paris, who was an eyewitness to this event, was summoned by the king on his royal throne in the nave of the church:

> "You have observed all these things, and is what you have seen firmly impressed on your mind?" "Yes, my lord, for the splendid events of this day are worthy of being recorded."

The king then said to Matthew Paris:

> "I therefore beseech you to write an accurate and full account of all these proceedings and write them in a noble and indelible script in a book that their memory may not in any way be lost to posterity."[536]

This passage is exceedingly interesting for several reasons. The story is told in great detail and Matthew then records it in an equally detailed narrative image, the last full-scale illustration to appear in the *Chronica Majora*.[537] Matthew Paris as eyewitness is directly commissioned to record the events. The king asks him to write them in a book, but Matthew apparently decides that these events are worthy of both a detailed description and a narrative image. What the image records that the text does not describe is the shape, colors, and character of the "crystalline vessel"; the fact that the king holds the vessel in draped hands as a sign of reverence and respect, in the manner that the priest would hold the eucharistic chalice during the liturgy; and the shape and colors of the canopy – rich burgundy red with golden circular designs – presumably made of silk or some other rich fabric. The image is a remarkable complement to the text, and it testifies to how seriously Matthew Paris took his charge to render the important events he had seen with care and precision, according to what he and the king understood to be the highest standards of an "accurate and full account." The Gothic naturalism that Villard de Honnecourt exhibited as an architectural observer in the 1230s in France are paralleled here by Matthew Paris as an historical observer in the 1240s and 1250s in England.[538]

We learn from this episode how important such a holy relic of the Holy Blood was to Henry III. The English king, having learned of the fabulous success of Louis IX in bringing relics of the Passion to his new palace chapel in Paris – many of which came to him via the Holy Land – may well "have felt a pang of envy."[539] The image gives special focus on the way Henry takes the relic in procession, emulating his brother-in-law Louis in Paris, and the way that Henry visually, as anointed king, combines royal and sacerdotal roles.[540] We learn how important seals of reliable and important witnesses were for authenticating the relic itself. We learn that the king expected Matthew to record these events in a manuscript book, a kind of official history, so that the importance of this event could be known to future generations. Also we learn that a precious reliquary was the vessel brought to Westminster by the king so that devout Christians could come there to venerate the Holy Blood.

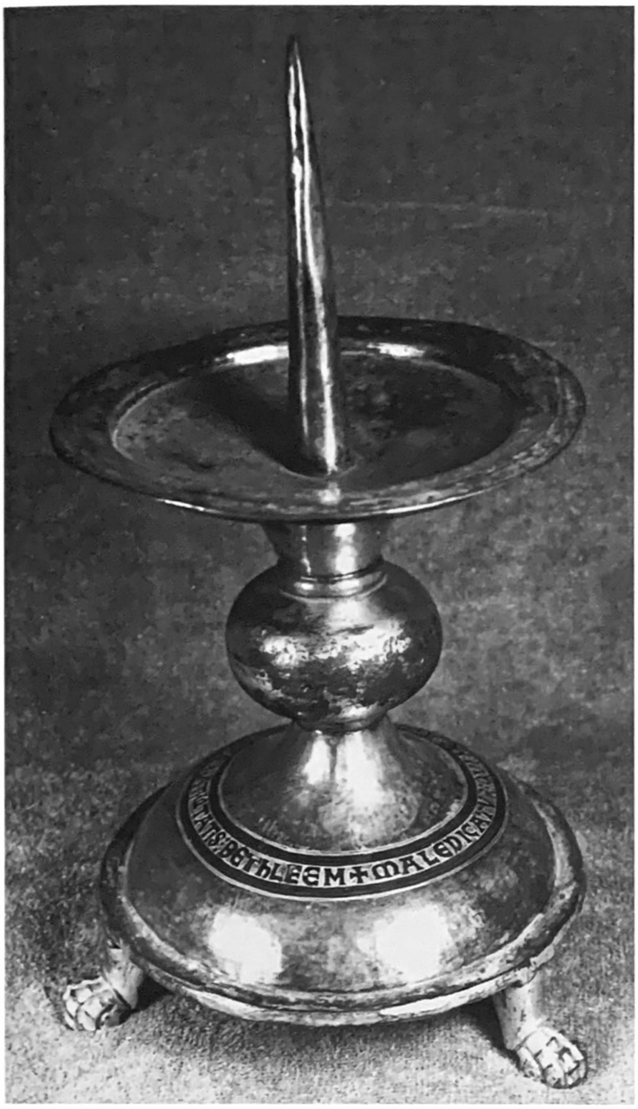
Finally, what is significant about this episode for our discussion, even if the relic and the reliquary no longer exist, is that they are said to have come directly from the Holy Land. Again, it was the Crusader kingdom of Jerusalem that supplied this precious relic, not the Latin Empire of Constantinople, attesting to the importance still attached to the holy sites as a source of precious relics. This is of note both because the relics of Louis IX had come from Constantinople by contrast, even if many had come via the Holy Land, and because it meant that it was still possible to obtain such relics, and special vessels to contain them, in the Holy Land. Presumably in 1247 this meant that the reliquary of the Holy Blood sent to Henry III by the Hospitallers and the Templars was produced in Acre.[541]

Despite the vivid testimony of chroniclers and artists like Matthew Paris, we have very few actual objects of metalwork such as reliquaries, liturgical objects, candlesticks, and other religious – or secular – metalwork extant or identified as yet from this period. On the other hand we know that a great deal of such metalwork existed, and was transported both East to West, as we have seen above, and West to East, as the case discussed in the following will demonstrate.

In 1245, the new bishop of Bethlehem, Gottifredo de' Prefetti de Vico, petitioned the pope to recover rights to the property of his see. This property, including liturgical vessels and relics, had been disposed of improperly by his predecessor, Bishop-elect Giovanni Romano, when, following the loss of Jerusalem and Bethlehem in August of 1244, he had sold it off, presumably to raise money. With the loss of his see, Bishop-elect Giovanni had been translated to Paphos on Cyprus in 1245, and the problem had arisen because the pope had nominated Gottifredo, or Godfrey, to be the new bishop of Bethlehem and eventually to take up residence there.[542]

When he was appointed bishop of Bethlehem on 3 January 1245 by Innocent IV, Gottifredo immediately submitted his petition. By 22 February 1245, the pope had directed the patriarch of Jerusalem, Robert of Nantes, to take authority in this matter and restore the Church of the Nativity in Bethlehem to its property rights. In a second letter of 20 August 1245 the pope refers to certain specific relics – major relics of the Church – a nail and a hammer used at the crucifixion of Christ, as well as a hand of the apostle Thomas, along with other property that he authorizes Bishop Gottifredo to reclaim, with either the Templars or the Hospitallers as guarantors for these precious objects. Bishop Giovanni Romano was meanwhile directed to appear at Lyon for an inquest in the spring of 1246. When he failed to appear, the pope wrote to Patriarch Robert and the new bishop of Acre, Gauthier of Provins, explaining the weighty charges against Giovanni Romano. In this letter he outlines in detail the buyers, both religious and secular, of property improperly disposed of, including the *bailli* of Jerusalem, the lord of Beirut, Balian III d'Ibelin. Bishop Giovanni Romano continued to ignore the papal summons. The resolution of this conflict occurred during the year 1247 when Bishop Giovanni was condemned. He was removed from the see of Paphos, and a new bishop was named there, Guy de Mimars, but Giovanni was allowed to remain in the East and reside in Jaffa. Meanwhile Gottifredo proceeded to reclaim the alienated property of the see of Bethlehem.[543]

In 1863, excavations in a cloister near the Church of the Nativity in Bethlehem recovered certain liturgical objects, which appear to have played a role in this peculiar affair.[544] Two



116. Bethlehem, Church of the Nativity: candlestick no. 1.

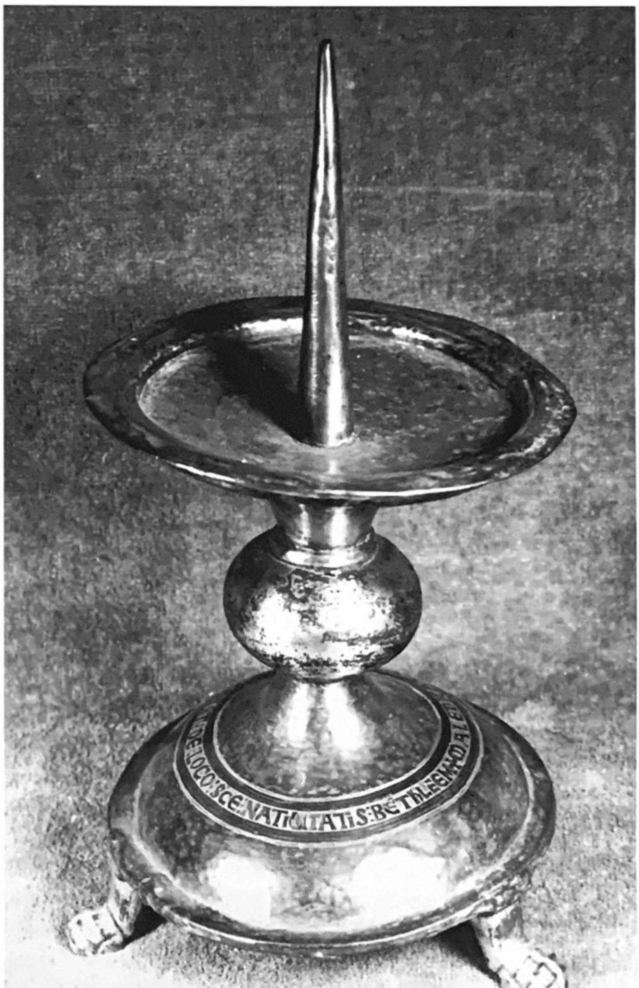
bronze bowls, decorated with scenes of the life of St. Thomas, along with five candlesticks and a crozier were found. Two of the candlesticks are inscribed with the following inscription, in niello on silver:

> maledicatur qui me aufert de loco sce nativitatis bethleem

that is, "anathema to him who would take me away from the site of the holy Nativity in Bethelehem."[545]

The objects found in 1863 are extant today in the Franciscan Convent of the Flagellation from the treasury of Bethlehem that Gottifredo de' Prefetti de Vico successfully restored. In 1906 a peal of 13 bells and 250 copper organ pipes were also found at Bethlehem from a separate site, the only such sets we have in the Crusader Kingdom.[546] The two bronze bowls, or *bacili*, were done in the twelfth century;[547] the crozier[548] and three of the candlesticks[549] are twelfth- and thirteenth-century Limoges enameled work, all of which apparently came from the West. The two silver candlesticks with the inscriptions may have been done in the West or in the Latin East and placed in the treasury in Bethlehem by Bishop Gottifredo (Figs. 116–17).[550] The bells and organ pipes may also be from the thirteenth century, and they appear to have been made in the West.[551]

These objects, now in the Museum of the Convent of the Flagellation, may have been part of the "aliis rebus ecclesie Bethleemitane" that the pope referred to in his letter of August 1245.[552] Although opinions have differed over when they were acquired for the church at Bethlehem, it appears that some of these objects represent part of the property improperly alienated by Giovanni Romano, and that with the possible exception of the two silver candlesticks and the musical objects, they were repatriated as part of this long inquest. The significant aspect about these works is that they are mostly works originally commissioned and produced in the West and brought to Bethlehem at some point. Some of the thirteenth-century objects may have entered the church treasury shortly before the inquest began in 1245. The silver candlesticks, however, may have been done for Gottifredo de' Prefetti himself in the Latin Kingdom at some point when he went out there to take up residence in the 1250s. Otherwise, they could be slightly earlier works for which Gottifredo commissioned the special niello inscriptions to be added with reference to the long affair over the Bethlehem church treasure. In either case, this remarkable set of objects taken together forms a telling indication that significant metalwork was being brought to the Crusader East in the twelfth



117. Bethlehem, Church of the Nativity: candlestick no. 2.

and in the first half of the thirteenth century. This phenomenon occurred even while Crusader metalwork was also being produced in the Latin Kingdom, perhaps on a level somewhat reduced in quantity, but not necessarily in quality, compared to work in Jerusalem before 1187.

The situation with the metalwork is obviously very incompletely understood, and it appears that this is one area along with the painting in manuscripts and on panels where significant new finds may be made in the future. Whereas works like the Bethlehem bowls or the Limoges candlesticks clearly are not "Crusader" in origin, they nonetheless become "Crusader" in function. Likewise they and other works brought similarly from the West must have influenced what the Crusaders themselves used and produced. Both issues warrant further investigation.

MANUSCRIPT ILLUMINATION AND PANEL PAINTING

The period 1225 to 1244 appears to be characterized by a certain amount of scribal activity in the Latin Kingdom. There was the execution of liturgical manuscripts and other private religious books, and the copying of the cartulary of the Church of the Holy Sepulcher. This probably indicates that Crusader scriptoria were trying to meet the new needs of ecclesiastical establishments and of the resident Franks, and that there was a continuing effort to replace books destroyed in the wake of Saladin's conquest in 1187–8 or other more recent devastation.

In the period of 1229–44, there is no doubt that some of the canons of the Church of the Holy Sepulcher returned to Jerusalem to perform the liturgy. On the other hand, we know that the patriarch of Jerusalem did not take up residence there, partly because of his opposition to the terms of the Treaty of Jaffa, and partly because Jerusalem had had its walls dismantled in 1219, and therefore the Holy City remained undefended. In view of this situation it is not likely that the scriptorium of Jerusalem was reestablished in the Church of the Holy Sepulcher as it had existed prior to 1187. What is clear is that a series of manuscript books closely related to each other in terms of scribal hands, and also closely linked to the Holy Sepulcher, were written,[553] which must have been done in its scriptorium wherever it had been reestablished, very likely in Acre.

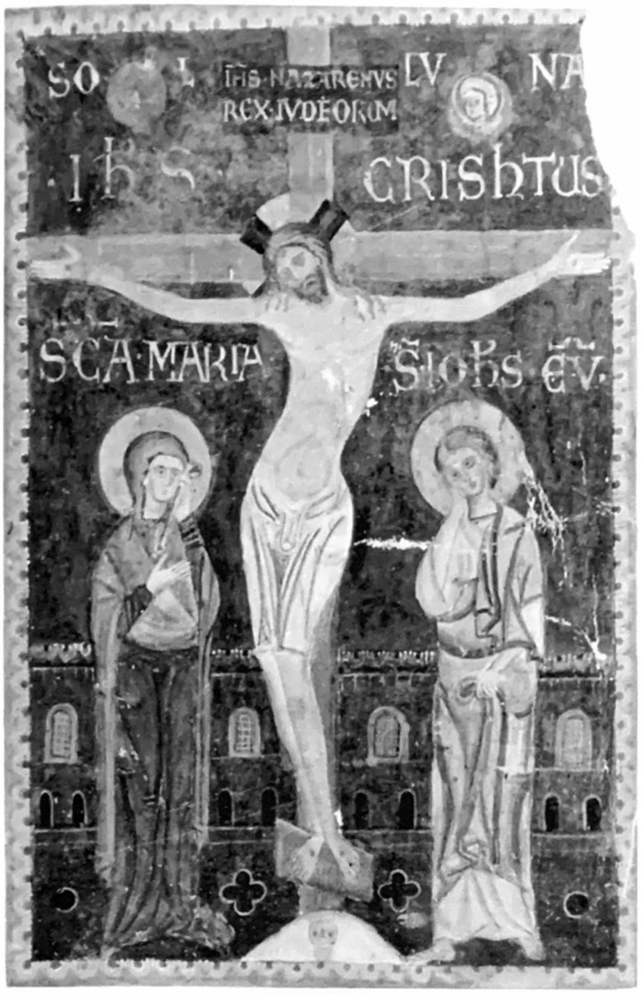
First, there is an illustrated sacramentary for the Church of the Holy Sepulcher in Jerusalem, which is now in the British Library, Egerton MS 2902 (Fig. 118).[554] Second and third, there is the rituale for the Church of the Holy Sepulcher, in manuscripts basically undecorated in regard to painted figural designs, one in the Vatican Library, Barberini Latin MS 659,[555] and the other in the Church of San Sepolcro in Barletta.[556] Fourth and fifth, there are undecorated manuscripts that are copies of the cartulary of the Church of the Holy Sepulcher, both now in the Vatican Library, Vatican Latin MS 4947[557] and Vatican Latin MS 7241.[558] Finally, closely related to these five manuscripts on the basis of scribal hands is another mostly undecorated codex known as the pontifical of Apamea, a codex formerly in the private collection of F. Wormald and now in the British Library (Fig. 119).[559] Each of these manuscripts has some interesting special features, some of which have been noted earlier, all of them are closely related on palaeographical grounds, and Egerton MS 2902 and the pontifical of Apamea are so closely related that they must have been copied by the same scribe, according to Wormald.[560]

It cannot be determined precisely where these manuscripts were all written, but it is very probable they were produced in a scriptorium established by the patriarch of Jerusalem, who lived in Acre throughout this period, and the canons of the Church of the Holy Sepulcher, who also apparently mostly lived in Acre, near their residences. Kohler points out, incidentally, that if the complete chapter of canons at the Holy Sepulcher had returned to Jerusalem after 1191, they would have been the only ones to do so as a group, and this seems to be true after 1229 as well.[561] If the new scriptorium of the Church of the Holy Sepulcher was located in Acre, as seems likely, it was very possibly in the Cathedral of the Holy Cross. Most of these manuscripts were copying texts, some with calendars, that originally were written for the Church of the Holy Sepulcher, but at this later point were apparently being used widely in the Latin Kingdom.

The only books to receive painted decoration in this group are the sacramentary[562] (Fig. 118, CD nos. 15–20) and the pontifical[563] (Fig. 119, CD no. 21), both of which are now in the British Library. They are both liturgical books, not private luxury prayer books. The calendar of the sacramentary has strong Jerusalem ties, but it also includes an unusual series of saints from the south of France, including St. Trophime of Arles and St. Apollinaris, bishop of Valence. This suggests that possibly the calendar copied in this codex was commissioned by Patriarch Gerold of Jerusalem (1225–39), who had been formerly abbot of Cluny and bishop of Valence.[564]

The main illustration in the sacramentary is a full-page miniature of the Crucifixion, which appears in the traditional location, at the start of the "Te igitur" text that begins the canon of the mass. The same painter also does a series of ornamental initials. Compared to the earlier Crucifixions in the Naples Missal (*c.*1200) or the Melisende Psalter (*c.*1135), this image has lost its close link with the Byzantine tradition. This artist certainly does not display the competent understanding of Byzantine iconography and figure style demonstrated by Basil in the Crucifixion of the Melisende Psalter. Yet even though his image is simplified iconographically into the figures of Christ, Mary, and John as seen typically in thirteenth-century painting, he does not match the Italianate painter of the Naples Missal in achieving a certain monumentality in the forms and a vivaciousness expressed in a lively colorism.

On the whole the Crucifixion in the Egerton sacramentary reflects modest goals on the part of the artist, and the end result is somewhat heavy-handed. Even though the figures are slender and the outlines of the attenuated Christ on the cross could even be seen as graceful, his body seems flat and lifeless, just as the bodies of Mary and John seem blocky, infusing the latter with a rigidity that even their gestures of sorrow cannot overcome. These formal characteristics are combined with an unusual choice of colors. The frame is red with an orange scalloped motif and white highlights. The background is dark blue, with an architectural backdrop below consisting of a dark green wall with a purple roof and red windows. The cross is colored by halves: the left side/lower side in soft light brown, the right side/upper side in soft light green. Christ is red-haired as seen on some Limoges enamels. Mary wears a bright dark-blue tunic with a purple veil/maphorion; John is in an orange-red



118. Sacramentary, London, British Library, Egerton MS 2902: fol. 14v, Crucifixion (full-page panel). (photo by courtesy of the British Library, London)

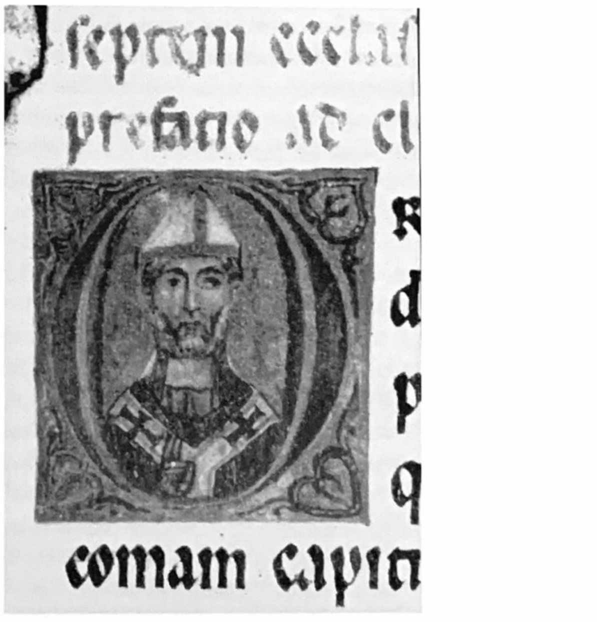
tunic and a light blue cloak. They all have orange haloes. The unusual colors, the traditional four-nail Crucifixion iconography, the simplified forms combined with the overly large and busy inscriptions, produce a curious effect. The odd spelling of Christ's name, "Crishtus," is particularly puzzling.[565]

As Buchthal characterizes it, this image "appears to be copied from a western model in the 'Italo-Byzantine' style." The artist was clearly not French Gothic; rather if he was a Westerner he may have been Italian or of Italian ancestry. Otherwise, he might have been born in the Crusader East and trained by Crusader artists of Italian background. Whoever he was, he has tried to grapple with the competing claims of Byzantine icon painting, the local Crusader tradition, and his own personal style and imagery, without great success. The mediocre result appears to be the product of a second-rate artist who has better results with the local tradition in his ornamental initials than with this large figural miniature. His initials for the opening prayers of the preface of the canon, "Per omnia . . . ," and "Vere dignum . . . ," follow types seen in earlier twelfth-century Jerusalem manuscripts, albeit very reduced and simplified, that must have been known through model books and/or atelier sketches.[566] Unlike those earlier manuscripts or the pontifical, however, the decoration of the sacramentary includes no gold or silver.

By contrast the pontifical has only one small but significant historiated initial. It features the bust of a mitered archbishop wearing the pallium – the figure for whom this book is specifically made – as the opening initial for the text that begins the first prayer, "*Oremus . . .* ". However, modest as it is, this initial combined with the other nonfigural initials reflect a level of decoration not found in the sacramentary, because of the use of gold for the bishop's miter, and for the major initials in the text, which feature a blue and gold format.

Despite its modest decoration, the pontifical is by far the more famous of these two manuscripts because of its liturgical text, a text first published in 1700.[567] At that time, however, the text was known by a modern copy, and the original manuscript only surfaced in a London sale-room in 1946, where Francis Wormald had the good fortune of acquiring it. The text is basically a Roman pontifical as it is known from the late twelfth century, and the current name of this manuscript derives from some contemporary additions. On fol. 21r, in the lower right margin, following the order for the consecration of a bishop, there has been added a profession of obedience to the archbishop of Apamea. Second, on fol. 205r, there is a long profession of obedience to the archbishop of Apamea, specifically from the bishop of Valania, on the coast of Syria, just north of Margat, in 1214.[568]

It will be evident from this discussion that, besides the decoration and the scribal hand, the only Eastern aspects of this liturgical text are these two additions, which were made shortly after the manuscript was copied. Furthermore, not only was the pontifical probably not made specifically for Apamea or Valania, but also the scribe used an old version of the text, not the recently revised pontifical of Innocent III. Thus the attribution of this manuscript to the scriptorium of the Holy Sepulcher depends on its palaeographical and codicological closeness to the sacramentary, and to some extent to the Riccardiana Psalter.



119. Pontifical of Apamea, London, British Library, Add. MS 57528, originally from the collection of F. Wormald: fol. 1r, (O)remus . . . , historiated initial with bust of an archbishop. (photo by courtesy of the British Library, London)

The codicological features of the pontifical and the sacramentary, as well as the style of their script, are all very close, but nonetheless the work of the two painters seems quite different: different in style and different in the use of color, sometimes color that is rather garish. Thus Wormald correctly observed that these manuscripts may have been done by the same scribe,[569] a man named *Normandus*, but as Buchthal observed, they appear to have been done for different patrons by different painters. Wormald suggested on the basis of the scribal characteristics and the calendar that the sacramentary may have been done during the reign of Patriarch Gerold of Jerusalem, 1227–39. The pontifical of Apamea can probably be assigned to approximately the same period, 1229–44, when the new access to Jerusalem perhaps stimulated commissions for additional liturgical books, and when the scriptorium of the Holy Sepulcher was possibly newly reorganized, probably in Acre.

The Riccardiana Psalter (Color Plate 2, Fig. 120, CD nos. 22–37)

The most famous illustrated manuscript to be associated with the Crusaders in the Holy Land during this period is the psalter now in the Biblioteca Riccardiana in Florence, MS 323.[570] Like the psalter of Queen Melisende done in Jerusalem *c.*1135, the Riccardiana Psalter is also richly decorated and illustrated.[571] It is clearly a work of the first rank, done for a special patron, perhaps also for a special occasion. In his incisive analysis, Buchthal identified its major remarkable characteristics, for which he proposed a provocative patron, and certainly to date, the most cogent interpretation of the evidence. However, problems remain and this difficult manuscript has defied Buchthal's attempt to reach a consensus understanding of its origins, nature, and function.[572] It is worthwhile here to review its important features and to attempt to carry the discussion further.

Palaeographically, the main scribal hand of the Riccardiana Psalter belongs to the second quarter of the thirteenth century, as both Wormald and Buchthal indicate.[573] The manuscript also has additions to the calendar from the late thirteenth century, even later emendations to the calendar and brief text passages (fols. 12v, 13, 14r) from the early fourteenth century, and the codex was signed by a Sister Margharita probably in the late fourteenth or fifteenth century.[574]

The content of the codex includes a handsomely decorated calendar, with red and blue "KL" initials on lustrous matte gold. The calendar contains many Jerusalem episcopal commemorations, a number of north Italian saints not normally found in a Jerusalem context,[575] three special additions made in the second half of the thirteenth century,[576] along with the addition of Dominican entries in an even later hand.[577] The festival commemorating the capture of Jerusalem is included at 15 July by the original hand, along with the feast days of St. Francis (4 October), St. Thomas Aquinas (27 March), and Louis IX (25 August), among several others, by the later Dominican hand. The commemorations of numerous Jerusalem bishops along with that of taking the Holy City by the First Crusade make clear it is a Jerusalem calendar in origin, and the later entries would presumably not have been begun before the canonization of St. Thomas Aquinas in 1323.

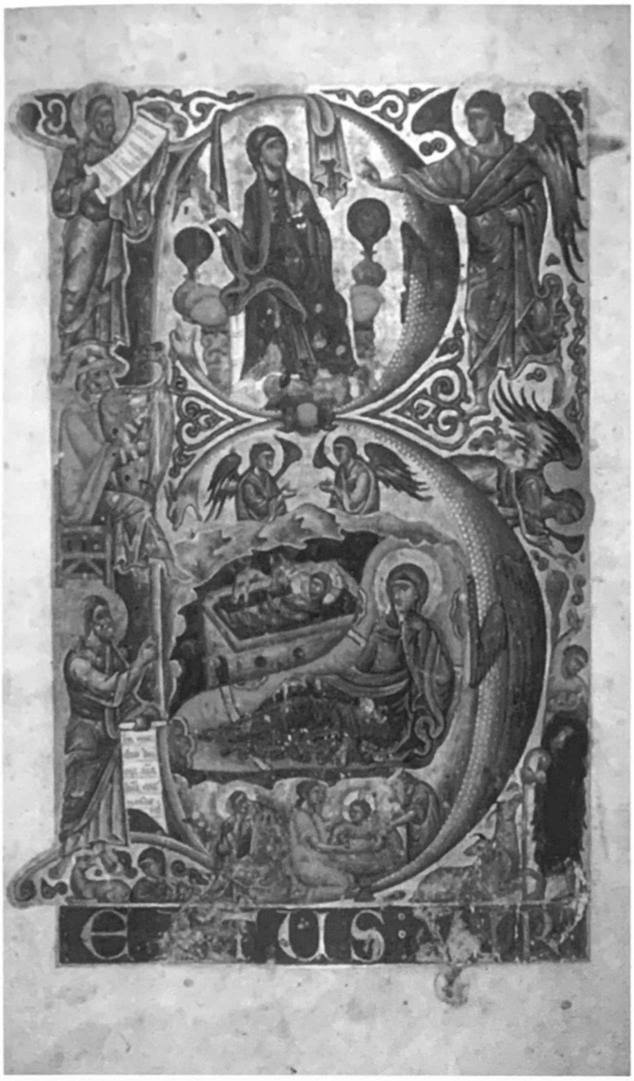
For the psalter itself, there is a full-page illustration with the Annunciation and the Nativity in the familiar "B" of the "Beatus vir" text that begins the first psalm (Fig. 120). Following this there are seven smaller panel miniatures continuing the life of Christ at the start of the subsequent sections of the psalter text, at Psalms 26 (Adoration of the Magi), 38 (Presentation in the Temple), 52 (Entry into Jerusalem), 68 (Last Supper and the Washing of the Feet), 80 (Harrowing of Hell with the Holy Women at the Sepulcher), 97 (Ascension), and 109 (Pentecost). Overall these sections form the standard eight-part or "liturgical" divisions in the Latin Church, which correspond to psalm divisions of the Roman office.[578] The practice of including a narrative cycle of images of the life of Christ distributed through the text of the psalter, but unrelated to it, and not as a prefatory cycle as we find in France and England,[579] was specific to Germany, as Buchthal pointed out.[580] There are also numerous illuminated initials, some with flora and/or fauna, some historiated with images of Christ, saints, and other holy men.

The psalter is followed by a litany at fols. 171r–v and 172r,[581] and then a set of prayers on fols. 172v–174v. The litany copied here was originally composed for a Benedictine nun.[582] Although there are no Jerusalem bishops to match those in the calendar, the references to female saints include St. Anne, mother of the Virgin Mary; this may be a reference to the royal Benedictine convent of St. Anne in the Holy City. Even though this house was appropriated by Saladin at the time of his conquest in 1187, the nuns migrated to Acre where they had a convent with a church even larger than the one they had in Jerusalem. The litany for Riccardiana 323 may have been based on a prayerbook done for someone at St. Anne's in Acre. Otherwise, this litany is notable for its inclusion of large numbers of northern French saints, for a large proportion of abbesses among the women saints, and for the appearance of the names of two English martyr saints, Eadmund of East Anglia and Edward, who died at Corfe in 979. Among the prayers there are also some that suggest the codex was done for a woman in the convent: "pro custodia loci" (fol. 173r), and "pro abbatissa" and "pro conservanda virginitate" (fol. 174r).

Based on these observations, Buchthal argues that the psalter must have been produced by copying the text of a *de luxe* codex that had belonged to a noble lady of royal descent who had been a member of the convent of St. Anne's in the twelfth century. He thinks that this hypothetical model may well have been the only such devotional text available that reflected Jerusalem for the new scriptorium in the first half of the thirteenth century. So this older manuscript model was modified for its new patron. Appropriate changes were made in the calendar, the old litany was expanded with some important new additions, the basic corpus of prayers was retained, and a new prayer, "*pro comite,*" was added at the end (fol. 174v). In its new configuration, the psalter was made, not necessarily for a nun, but for a noble woman probably of royal rank.

He concludes his argument as follows:

> There can be no doubt that the decoration of the Riccardiana Psalter reflects German usage. The most likely person to have commissioned it is of course the Emperor Frederick himself. If this suggestion is accepted, the allusions to English royalty in the litany appear at once in their true perspective: the manuscript was written for the Emperor's third wife, the



120. The Riccardiana Psalter, Florence, Biblioteca Riccardiana, MS 323: fol. 14v, (B)eatus vir . . . , (historiated initial in full page panel) Annunciation and Nativity. (photo by courtesy of the Biblioteca Riccardiana, Florence, Ricc. 323). See Color Plate 2.

> English princess. As the marriage took place in 1235, this year provides a *terminus post quem*; a prayer "*pro comite*" which can only refer to the popular ex-king, John of Brienne, who died in 1237, gives a convenient *terminus ante*. The manuscript may thus be dated 1235/1237. The most likely assumption is that it was intended as a wedding present, to be sent to Worms to remind the Emperor's English bride, as well as his German subjects, of his outstanding success as the protector of the Holy Sepulcher. An illuminated manuscript of such distinction produced in his fabulous kingdom Outremer would be a rare and precious gift, eminently fitted to impress his countless guests at Worms where works of this kind had probably never been seen before.[583]

In sum, he proposes that Emperor Frederick II commissioned the codex as a wedding gift for his third wife, Isabel, sister of Henry III of England.

This scenario, although brilliantly conceived and methodologically sophisticated, nonetheless cannot survive historical scrutiny. If we accept the idea that the prayer "*pro comite*" specially added at the end of the manuscript at the time of its production refers to John of Brienne, it is inconceivable that it would have been commissioned by Frederick II in 1235. Frederick incurred the hatred of John of Brienne by his brutal treatment of John following the emperor's marriage to John's daughter in 1225. Subsequently, John of Brienne had personally led papal troops against Frederick into the kingdom of Sicily in 1228, and then been forced to flee into France when Frederick returned to confront him following his successful conclusion of the Treaty of Jaffa in 1229. By 1235 John of Brienne was in fact the co-emperor of the Latin Empire of Constantinople, an unlikely candidate to be remembered by the prayer "*pro comite*" in any case. Finally, why in 1235 would there have been such a prayer in this manuscript referencing John of Brienne at all? Isabel, the sister of Henry III, had no close family relationship to John, and John had not been regent for Jerusalem since 1225.

The commission of this manuscript by the emperor in 1235 from the Holy Land would have been unlikely on other grounds as well. Between 1235 and 1237, the patriarch of Jerusalem was Gerold of Lausanne, the same patriarch who had expressed unmitigated opposition to Frederick's Treaty of Jaffa in 1229, the same patriarch who had leveled an interdict on Jerusalem during the emperor's visit to Jerusalem in March of that year. Gerold was, furthermore, the same patriarch whom Frederick had caused to be recalled to Rome during 1233–7 to face papal inquiry as a threat to his cause.[584] Furthermore, in 1235/7, the Latin Kingdom was, as we have seen previously, still divided by the bitter civil war that had raged between the imperial partisans and the Ibelins. Acre, the likely site of the scriptorium of the Holy Sepulcher, as we have already suggested, was in the hands of the Ibelins. Therefore, it is unlikely that a manuscript commission from Frederick II would have been approved by Patriarch Gerold – or his appointed deputy in Acre – for his scriptorium to execute, especially while Acre was under Ibelin control. Certainly in 1235 there is no evidence that any other major scriptorium existed in the Holy Land, for example, in Tyre, which was in imperial hands, or least of all in Jerusalem, capable of work as outstanding as we find in the Riccardiana Psalter. Therefore, the notion that Frederick II would have commissioned a *de luxe* manuscript for his bride-to-be from the scriptorium of the Holy Sepulcher in Acre in 1235 also seems highly unlikely, if not impossible.

The framework of Buchthal's and Wormald's analyses and aspects of Buchthal's hypothesis might still be useful and relevant if we change the circumstances, *mutatis mutandis*, from 1235–7, to 1225, ten years earlier. Consider the following: in 1225 Frederick II agreed to marry another Isabel, namely Isabel of Brienne, who was born in the Holy Land in 1212, the daughter of Queen Maria of Jerusalem and King John of Brienne. In 1225 when Frederick accepted the papal suggestion that he marry Queen Isabel, there was good reason to have a prayer, "*pro comite*," referring to John of Brienne in this devotional book. Queen Maria had died in childbirth in 1212 and Isabel's father, John of Brienne, at that point was regent for Isabel, no longer king himself. With the pope, the master of the Teutonic Knights, the patriarch Ralph of Jerusalem, and John of Brienne in agreement that this wedding was in the best interests of the Latin Kingdom, there can be no doubt that Frederick could have commissioned such a manuscript for his bride-to-be from the scriptorium of the Holy Sepulcher at that time. Based on the evidence we have, how likely is it that he did so?

The palaeographical characteristics of this manuscript, placing it in the second quarter of the thirteenth century by the hand of a French scribe, are still valid if the manuscript was commissioned in 1225 instead of 1235. The Jerusalem character of the calendar is also valid, with its Jerusalem bishops and the commemoration of the conquest of the Holy City by the First Crusade. The presence of north Italian saints in the calendar are not obviously relevant, but neither are they necessarily determinative. As Wormald himself says, "the Riccardiana calendar presents fewer peculiarities than the Egerton one. Whereas in the latter there was a marked display of south French saints which can with some reason be associated with the patriarch Gerold, in the Riccardiana calendar the most interesting saints which are not common to the Jerusalem calendar seem to be north Italian."[585] In any case, we have no evidence that the insertion of these north Italian saints in the calendar was necessarily done when the Riccardiana Psalter was produced.

The litany and the prayers at the end of the manuscript also provide similar problems. The inclusion of St. Elizabeth as a namesake for the bride-to-be is equally relevant for Isabel of Brienne as it was for Isabel of England, if it was a special addition. The large number of northern French saints would not be inappropriate for a lady whose ancestors came from Brienne in the northern French territory of Champagne. The presence of two English martyrs is interesting and unusual, but again they are not necessarily determinative. The original manuscript with this litany and the prayers may indeed have been based on a prayerbook for a nun at St. Anne's resident at Acre. When the new manuscript was copied from this hypothetical model, a few additions were made – the litany was expanded to include certain new saints and the prayer for John of Brienne was added at the end of the codex. Wormald's comments are again interesting:

> the litany of saints in the Riccardiana Psalter differs very considerably from those found in Queen Melisende's Psalter and in the manuscripts connected with the Holy Sepulchre at Jerusalem. Moreover, its contents bear little connexion with the entries in the calendar found at the beginning of the manuscript.... What certain evidence there is shows that this litany was composed for recitation by Benedictine nuns.... If, as seems certain, the manuscript was written in Jerusalem, this litany must represent that of the convent of St. Anne in Jerusalem. This house had, however, disappeared in the fall of Jerusalem in 1187, so the Riccardiana Psalter cannot have originated there, though a litany composed for that convent could have been used as a basis for that found in the psalter.[586]

The Convent of St. Anne in Jerusalem was no longer in operation after 1187, true enough, but the nuns of the convent had not disappeared; they had relocated in Acre, as we mentioned earlier. In this instance therefore, if the original manuscript was, appropriately, a private prayerbook for a noble lady in the Convent of St. Anne's in Jerusalem, as Buchthal and Wormald argued, and this manuscript was used as a model for the Riccardiana Psalter in the early thirteenth century as seems very likely, the litany and the prayers, quite possibly along with the psalter text itself, must have been part of that model. However, the calendar seems to have come from an independent source, albeit again a Jerusalem source. Obviously it would be peculiar and unlikely that a prayerbook for a noble Benedictine nun would have had a calendar that omitted the name saints of her convent, Benedict, Anne, and Giles, any of the numerous French saints, or the numerous abbesses among the female saints, all of which are included in the litany. Therefore we would suggest that either the model manuscript had lost its calendar or, perhaps more likely, a generic Jerusalem calendar was chosen for the Riccardiana Psalter from another source, because the person for whom the new manuscript was being done was not a nun. That means the litany and prayers were retained from the original prayerbook source, modified as indicated, and combined with a calendar taken from another Jerusalem codex for use by Queen Isabel of Brienne.

Such a proposal, although attractive, does not, it must be admitted, explain all of the special features of the calendar, the litany, or the prayers of the Riccardiana Psalter. To paraphrase Leroquais, the fact that a text from a liturgical manuscript – a calendar or otherwise – is transcribed for other, later usage certainly does not mean that the original text and the later transcription were made in the same place, nor that all the characteristics of the original are relevant later.[587] However, the essential features of the major components are, I submit, understandable in these circumstances. The need for a basic Jerusalem calendar was critically important if this was to be a gift of a private prayerbook from the Latin Kingdom for the queen of Jerusalem. Certain additions were made to the litany and the prayers, but care must have been taken not to damage or obscure the special character of their content and the fact that they were originally made for a royal female member of the Convent of St. Anne's in Jerusalem. However, it would not after all be irrelevant to a married queen of Jerusalem to have a large litany and a set of prayers that included some particularly composed originally for celibate monks and nuns that she could pray for, pray with, and pray to as part of the essential fabric of her personal devotions.[588]

Considering the possibility then that the Riccardiana Psalter may have been done for Queen Isabel of Brienne as a personal prayer book in 1225, where might the manuscript have been done? It is impossible to think that it would have been executed in Jerusalem. Neither the Convent of St. Anne's nor the scriptorium of the Holy Sepulcher existed in Jerusalem in 1225. The nuns of the convent had moved to Acre by that time, and if the scriptorium of the Holy Sepulcher existed in Acre at that time, for which we at least have circumstantial evidence, it is possible that Acre, or, much less likely, some other site in the Crusader States such as Tyre, may be the place where this codex was done. To examine the question of where and when the Riccardiana Psalter was executed, let us turn to the illustrations. They more than any other aspect of this manuscript proclaim the *de luxe* quality of the book, and they can perhaps help us understand critical aspects about its origin and function.

We begin by recalling Buchthal's observation that the decoration of the psalter reflects German usage. He is referring here to the Saxon-Thuringian practice of inserting full-page scenes of the life of Christ in manuscripts, such as we see in the Psalter of Hermann the Landgrave of Thuringia, the first of the "Vita Christi" group at the beginning of the thirteenth century.[589] In fact the series of illustrations in the Riccardiana Psalter is comparable to this German method of illustration, but different in terms of which illustrations are selected; the Crucifixion image, which was central to the German series, does not appear in the

Riccardiana manuscript. The Riccardiana Psalter is also different because it contains the images of the Annunciation and the Nativity, which are not regularly included in the German psalters. Finally the Riccardiana Psalter has only one full-page miniature, whereas the German psalters typically have all eight (or ten) illustrations in full-page format.

With regard to other Crusader psalters, for example, the Melisende Psalter of *c.*1135 has a prefatory cycle of twenty-four miniatures in the English manner, in contrast to the eleven scenes in eight miniatures in the German format for the Riccardiana Psalter. Although it is true that the Melisende Psalter contains every scene illustrated in the Riccardiana Psalter, the iconography is frequently quite different in the later manuscript. Stylistically even though both manuscripts are painted by artists who are knowledgeable about Byzantine art, the specific styles differ markedly, the earlier master reflecting eleventh-century Byzantine painting and generic Western Romanesque artistic traditions, the later master combining more recent Byzantine models with Western traditions specifically from Sicily, about which we shall have more to say later. The Riccardiana Psalter is therefore distinct in format, style, and iconography from the twelfth-century product of the Holy Sepulcher scriptorium. I propose that it might have been commissioned as a royal psalter for a queen of Jerusalem, but it breaks with the past and reflects new Crusader artistic ideals that are not dependent on the old scriptorium of the Holy Sepulcher.

If we examine the miniatures in the Riccardiana Psalter more carefully, we note some surprising discoveries. In the first miniature with the great "B" of the "*Beatus vir*" text, the first two scenes of the life of Christ, the Annunciation and the Nativity, are introduced by certain prophets, Isaiah for the former and Habukkuk for the latter, who carry scrolls with appropriate texts in Latin.[590] These texts are important because they are literal Latin translations of the Greek Septuagint text, not simply quotes from the Vulgate, demonstrating that the artist was basing his work on immediate Byzantine sources, translating both the text and the imagery into the Crusader idiom directly. King David plays his music on the stem of the letter between the two standing prophets.

The basic iconography and style of these scenes and figures is strongly Byzantine, but there are formal details that indicate the fact that this artist is not Greek, but rather Crusader and probably from a strong Sicilian background. Buchthal has discussed the Byzantine characteristics of the style and has pointed to what he sees as the Sicilian parallels. He refers to the treatment of the draperies found in these figures as closely parallel to the style seen in the well-known seated Virgin and Child in a missal from Messina done *c.*1200.[591]

> The figures have volume and plasticity; voluminous draperies cover their fully articulated bodies and emphasize the actions of their limbs. The closest parallels to this style are, however, not found in Greek manuscripts, but in certain Sicilian miniatures under strong Byzantine influence.... Thus it appears that our master works in the artistic tradition of Norman Sicily; his western background is, for instance, obvious in the rendering of such details as the network of lines covering the face of the angel, which intersect in pointed angles and form rigid unorganic patterns.[592]

I propose that Buchthal and other commentators are undoubtedly correct to see the Byzantine and Sicilian foundations for the style in which the Riccardiana Psalter master was trained, but that his immediate modus operandi should be sought in the atelier tradition that had somewhat earlier produced the San Danieli Bible. If we compare the overall look of the miniatures as works of painting with glowing golden backgrounds in the two manuscripts, they clearly suggest a strongly related common tradition. Analyzing the style of the figures, there is of course no doubt that the San Daniele Bible was painted in the late twelfth century. Contrast Christ on the donkey in the Riccardiana Psalter (fol. 62r) with the mounted Macchabee figure from the Bible (fol. 156v) to see how different the artistic hands and their styles are in specifics. However, nonetheless, they have common concerns such as their extraordinarily rich color palettes, their harmonious treatment of the color, and their integration of strong pattern with painterly finesse. Even if the colorism is Byzantine-inspired in both, the remarkable effects created by the red–oranges, the strong blues, plums, and dark greens found in the "B" miniature of the psalter is paralleled by the dark purple, bright reds and blues, and deep greens in the Bible, both palettes set on lustrous gold grounds. In fact the gold grounds are handled similarly, to some extent in the Sicilian manner, in that, for example, the gold elegantly forms a sometimes undulating outline, best seen in the "B" miniature of the psalter (fol. 14v) as compared to the figure of the prophet Haggai in the Bible (fol. 28r). This feature is paralleled as what might be called a workshop trait in the notable highlighting also found in both codices. The highlighting in rich grays over dark blue and plum colors in the "B" miniature figures is a limited version of the similar and remarkably coloristic highlights found in the Bible in gray–white, light blue, or even yellow.

Other miniatures in the Riccardiana Psalter reveal additional aspects of this artist's Crusader style and iconography. The adoration of the Magi (fol. 36r) uses standard Byzantine imagery, but the particular rendering of the Virgin and Child in the cave at Bethlehem reminds us of the site-specific iconography found in the icon on the column of the Church of the Nativity. Furthermore, the remarkable treatment of the carpentered throne whose back is seen from the rear is also notable here, reminding us of the tradition of such high-back wooden thrones so important in Italy later in the thirteenth century, but apparently derived from Byzantine origins and reflected in Crusader work between 1200 and 1291.[593]

In the Presentation of Christ in the Temple, found on fol. 49v, and the Entry into Jerusalem, on fol. 62r, the dynamic activity of the figures and their robust corporeality contrast markedly with the delicate miniaturized representations of the architecture. The Crusader propensity to transform the spiritualized experience contained in Byzantine art to one with forceful physical and psychological sensibility and accessibility is plainly in evidence here. The claims that the architecture seen in these two miniatures may relate to actual Crusader buildings in Jerusalem, such as the *Anastasis* Rotunda and the campanile of the Church of the Holy Sepulcher seen on the right side of the scene of the Entry into Jerusalem, are difficult to evaluate. On the one hand, these architectural motifs are inherently simplified and somewhat generalized. In their manner of presentation here, they are much less specific in their references to Crusader Jerusalem than aspects of other works of architecture found in the last four miniatures of this series in the psalter.

On the other hand, motifs equally simplified can be found to refer to specific Crusader buildings in Jerusalem on coins and seals, and even on small-scale relief sculpture, such as the curious bit of Crusader *spolia* that has been identified set into the entrance wall of the mosque of Sultan Hasan (*c.*1356) in Cairo (Fig. 121).[594] The latter sculpture is said to depict representations of the Dome of the Rock in the center, the Citadel of Jerusalem with the Tower of David, or the *Curia Regis* – the residence of the royal court near David's Gate – at the bottom, and the badly damaged image at the top is thought to be the Church of the Holy Sepulcher.

The fifth miniature in the cycle represents an extremely unusual version of the Last Supper combined with the washing of the feet, set in the architectural framework of the Cenacle. Although here the image does not obviously reflect any specific feature of the *Coenaculum* that can be identified with the Crusader holy site in 1225, the architectural setting is stressed and the artist has creatively put these two scenes together in a novel composition. Whereas Christ appears twice in this image, once at the head of the "omega"-shaped table for the Last Supper, and once kneeling in front of the seated Peter, the apostle only appears once and simultaneously participates in both scenes.[595] Here the combination of East and West, which we have characteristically seen to be typical of Crusader artistic production, is found. It is presented both stylistically, with Byzantine and Romanesque traditional features, and iconographically, with the Western emphasis on Peter, the combination of the two scenes and Christ's kneeling posture below, combined with the Eastern imagery of the Last Supper and the Washing of the Feet with Christ drying Peter's feet and Peter pointing to his head.

As we noted earlier, there is no image of the Crucifixion; instead we find next a remarkable version of the *Anastasis*, with the Holy Women at the Tomb below. Again here the Eastern tradition is strongly apparent, with two half-length angels flanking the dynamic figure of Christ, reflecting the mosaic of the *Anastasis* in the apse of the Church of the Holy Sepulcher, thus relating this iconography to a specific Jerusalem landmark.[596] The artist has furthermore creatively focused our attention on the handsome figure of Christ by presenting the flanking figures of Adam, Eve, and the worthies of the Old Testament as truncated, essentially bust-length figures. In the lower scene, the Western iconography of three holy women approaching the empty sepulchre, based on Mark's Gospel, is combined with what is otherwise essentially a traditional Byzantine representation of this episode, except perhaps for the rather grand image of the sepulchre itself that may reflect the *Anastasis* rotunda.

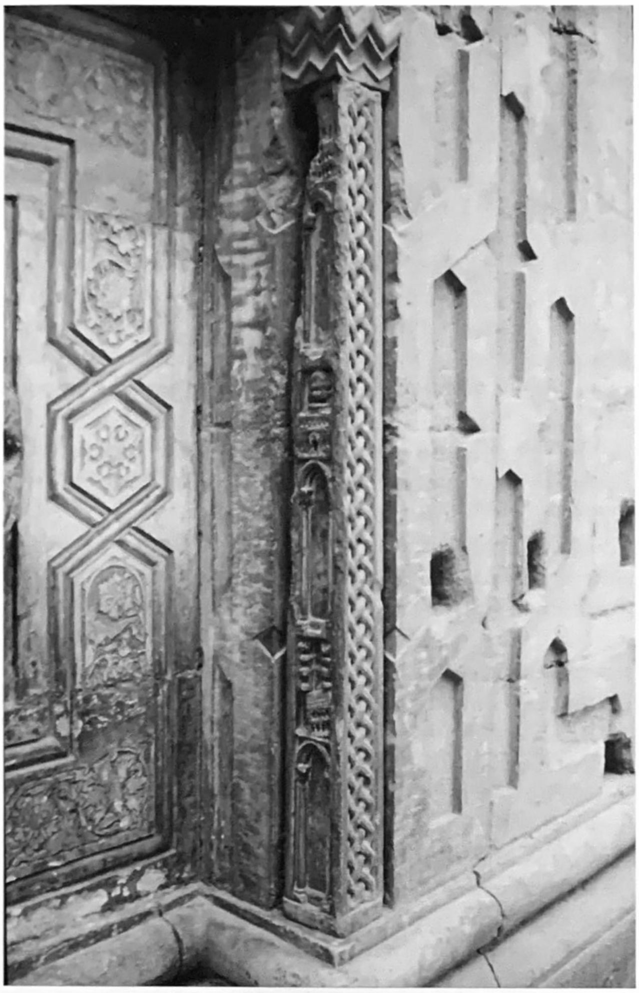
The seventh miniature in this cycle contains a representation of the Ascension, which echoes certain traits of the *Anastasis* image just mentioned. A striking immediacy is attained for this depiction of the ascending Christ in a golden mandorla by the artistic use of half-length figures below. The iconography for this scene is basically Byzantine, and there is no attempt to render the architectural setting of this holy site on the Mount of Olives in this miniature. Nonetheless, the reduction of the Virgin and her apostolic observers to a bust-length format as well as the simplification of the disciples to two clusters is a Western approach,[597] one seen quite effectively employed in Germany in the thirteenth century as a matter of fact, and this combination of traditions in Eastern and Western Christian art again reflects a distinctively Crusader handling here.

The final miniature in the series contains a representation of Pentecost. Here again the imagery is fundamentally Byzantine, and there is no attempt to represent the architecture of the cenacle where the apostles met in the upper room and received the gift of the descent of the Holy Spirit. There is again, however, a Western tendency to simplify and reduce the figures of the apostles other than Peter and Paul, who are clearly emphasized here, and the representatives of all nations to whom the disciples would speak in their own languages. Thus the cycle ends on a strongly Byzantine iconographic note, which is modified by stylistic characteristics that combine both Sicilian and Crusader aspects.

We should also recall that the Riccardiana Psalter is graced by a set of impressive illuminated initials, many of which are historiated. They are varied in form, elegant in execution, and altogether impressive adjuncts to the miniature panels, which taken together as an ensemble reinforce the harmonious nature and unified program of the decoration in this aristocratic prayerbook. The same artist who worked on the minatures seems to have done the initials, a fact that comparison of the beautifully painted figures – full length, bust length, heads only – in the initials to those in the panels and the opening full-page miniature will demonstrate. The vocabulary of the decorative initials seems every bit as rooted in Sicilian tradition as the figure style we noted briefly earlier. See, for example, the handsome dragons in the "B" of the opening *Beatus* text as compared to those found in the missal in Madrid, already cited with regard to its comparable figure style.[598]

At this point we should acknowledge that many scholars have observed the strong Sicilian characteristics apparent in the painted work in the Riccardiana Psalter, and some, unlike Buchthal, have attributed this manuscript there. These scholars include, for example, A. Daneu Lattanzi in the 1960s[599] and Cathleen Fleck in the 1990s. Valentino Pace has proposed to see this manuscript as being done in the Holy Land by an artist from southern Italy, but he prefers Apulia to Sicily, which at this period is a very sensitive refinement of the basic Sicilian hypothesis. One of the distinguishing characteristics of Pace's view is the close ties he sees between Apulia and the Holy Land, ties manifested by the San Danieli Bible and the Riccardiana Psalter.[600]

Turning to the issue of where and when the Riccardiana Psalter was done, we must assess the content of my discussion earlier, in light of the corpus of scholarship on Sicilian manuscript illumination and in consideration of the illuminated codices associated with Frederick II from the 1220s to 1250. Obviously my argument to associate the Riccardiana Psalter in 1225 with the San Danieli Bible, done a full generation earlier also in the Holy Land, is neither a radical departure from scenarios already considered nor demonstrable in terms of any startlingly new evidence. However, I believe that seeing the Riccardiana Psalter as having been done in 1225 does clarify certain problems. I think that its connection with the San Danieli Bible is strengthened. I suggest that some of its major characteristics make sense when seen as a gift to Isabel of Brienne, queen of Jerusalem between 1225 and 1228. However, the question remains, if Isabel of Brienne was the recipient, who commissioned and gave her the manuscript?



121. Jerusalem: Cairo, Mosque of Sultan Hassan, Crusader relief.

I do not think that with this or any other scenario we can assume the donor was Frederick II. There is no strong link between what we find in this manuscript and what we know of manuscript illumination connected directly with Frederick in the kingdom of Sicily, whether in Apulia or elsewhere.[601] Rather than approach the problem in this manner, consider what the function of the manuscript appears to be. The Riccardiana Psalter seems to be an aristocratic prayerbook made for a noble woman of high rank. As distinguishing traits it has a Jerusalem calendar, a somewhat personalized litany, and a group of prayers with a special prayer, "*pro comite*," which could refer to the ex-king, John of Brienne, but the fact is this prayer could refer to any of a number of Levantine counts. The lavishness of the decoration and the high level of quality leave no question that the book was a unique commission. The special iconography of the psalter illustrations have the distinctive characteristics of Crusader work, and the imagery of the eight miniatures for the psalm divisions lays stress on the holy sites in and around Jerusalem. Apparently no expense was spared to find an artist and a scribe who could do the very finest work.

A work of this character could make sense as a gift to the young Queen Isabel of Brienne on the occasion of her coronation and marriage to the emperor, Frederick II, in 1225, but we cannot say for sure it was done for her. In fact, it could have been done for any of a number of Crusader noblewomen. It is as yet also impossible to say who the patron or patrons of this gift may have been. Whoever it was, the commission could have been sent to the scriptorium of the Holy Sepulcher in Acre. Whatever the commission may have contained and however it was transmitted, it clearly specified that the manuscript should be richly illustrated – perhaps a German psalter was sent along as a model to be used along with the Crusader resources at hand. To whomever the responsibility fell to have the commission carried out, it was clear that they would have to find the best possible artist and scribe for the job.

If we are correct to date the Riccardiana Psalter closer to 1225, it becomes the earliest product of the scriptorium of the Holy Sepulchre during this period, with the sacramentary next, probably about 1227–30, followed by the pontifical of Apamea thereafter, but most likely before 1244. What can be said about these manuscripts as a group? The sacramentary and the pontifical are closely related palaeographically and codicologically, but distantly related to the Riccardiana Psalter by their minimal illustration and by their ornamental initials, which also reflect aspects of the missal in Naples from *c.*1200. However, both of these manuscripts are quite provincial in style and execution, compared to the high style of the aristocratic psalter, which was apparently executed with the greatest care for a very special occasion and a very special recipient. The Riccardiana Psalter, like so many aristocratic books, is unique in many ways, and has little in common with other products of the Latin Kingdom between 1225 and 1244. This can plausibly be explained as the result of a very detailed and particular commission for the manuscript in question, and it was made in a scriptorium that was obviously capable of functioning at a very high level, but of whose products there are unfortunately very few extant from these years.

The "Crusader" Illustrations of Matthew Paris

We cannot pass this point without mentioning briefly the inspired narrative imagery of Matthew Paris, who, although he never traveled to the Holy Land and can certainly not be considered a Crusader artist, makes an important contribution to what might be called "Crusader" illustration. We know that Peter des Roches, bishop of Winchester, brought copies of William of Tyre's great historical works to the library of St. Alban's in 1231.[602] We may speculate that one of these books could have stimulated and inspired Matthew Paris in his work, which began in earnest when he succeeded Robert of Wendover in 1236 as the next historian of the abbey.[603]

What is truly remarkable about Matthew Paris from the point of view of the current study, of course, is that his copious historical writings, carried out over the next twenty-two years, from 1237 to 1259, were accompanied by lively narrative drawings. Whatever texts of William of Tyre's two great works of history he may have seen, it is unlikely that they were illustrated. The extant Latin texts we have of William's *Historia rerum in partibus transmarinis gestarum* are mostly unillustrated; only one received an historiated initial at the start of the work decorated with a generic chevalier on horseback.[604] Even the earliest extant Old French translation of William of Tyre's text of the *History of Outremer* with a full cycle of detailed historiated initials only dates to the period 1245–8 and was done in Paris, not the Holy Land.[605]

In regard to the Crusaders, Suzanne Lewis discusses Matthew Paris's work in relation to the catastrophic loss of Jerusalem in 1244.[606] She writes,

> From the beginning of the thirteenth century on, the St. Albans historians view Christendom as having been caught in an inexorable vise formed by a resurgent Islam on the one hand and a faithless, morally corrupt papacy on the other. For Matthew Paris, immediately pressing military dangers overshadowed the religious issues. From the rise of Saladin in the 1180s through Richard of Cornwall's Crusade and the eruption of the Tartar invasions of 1241–2, events in the Middle East inspired the St. Albans artist to create some of his most gripping and dramatic scenes of combat and gore in the margins of the *Chronica Majora*.[607]

There are several remarkable features about his illustrations. First, Matthew Paris covers an historical period that includes the years 1187 to 1244, a time of catastrophic defeats for the Crusaders. The events of these years are given relatively few narrative images in the William of Tyre texts with continuations, and the earliest extant *History of Outremer* manuscript with illustrations for this period is dated only in the 1260s, after Matthew Paris had died.[608] Second, the usual *History of Outremer* manuscripts with continuations to 1261 or into the 1270s that contain illustrated cycles may include an image of the Third, Fourth, or even Fifth Crusade, but typically they then skip to the Crusade of Louis IX, paying little or no attention to the Crusades of Frederick II and those of Thibaut of Champagne or Richard of Cornwall.[609] Matthew Paris, on the other hand, selects a few dramatic moments that proved pivotal for the Crusaders during those years and provides a vivid image for each.[610] Matthew, for example, illustrates the moment at the battle of Hattin in 1187 when Saladin captures the relic of the True Cross.[611] He illustrates the siege of Damietta in 1219 during the Fifth Crusade.[612] He also does a drawing of the battle of La Forbie in 1244.[613] Finally, it is notable that for the battle of Hattin and the battle of La Forbie, there is no known image in any extant William of Tyre illustrated codex. Thus even though Matthew Paris was not an eyewitness to the Crusades, he makes notable contributions to the knowledge of the Crusades in England by means of his meticulous historical texts and in his remarkable drawings.

In sum, just before the moment when Louis IX would take center stage in the ongoing drama of the Crusades, a moment when in fact we begin to see for the first time extensive secular texts start to be illustrated in western Europe, Matthew Paris leads the way in England with his precocious work. It is only shortly after this time that manuscripts of the Old French translation of the *History of Outremer* by William of Tyre, with or without continuations, begin to receive full cycles of narrative illustration in the Holy Land.[614]

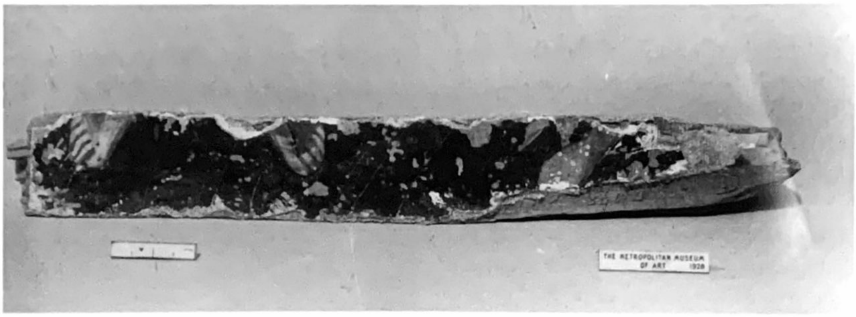
Crusader Icons and Panel Painting

The most tantalizing evidence of Crusader painting that may date from the period 1225–44 is the tiny fragment of a painted panel excavated at Montfort in 1926 (Fig. 122, App. no. 129).[615] Measuring 22 cm (9.75 in.) wide by approximately 2.5 cm high, this wooden piece is conspicuously broken at the top, far left, and along the lower right side. On the part that remains we can see the sandaled feet of a standing male figure at the left, and to the right is one of a pair of imperial buskins that would presumably be worn by a standing male saint. Given the position of the feet and the size of the fragment, it is likely that this panel contained only two frontally standing figures, if we compare our data to the extant icons now in the collection of the Monastery of St. Catherine's on Mount Sinai. The sandaled feet could belong to a range of possible male figures, mostly saints including Peter, Paul, James, and John the Baptist, or Moses, among others.[616] The foot with the buskin might belong to a figure of St. Stephen, Theodore, George, Demetrius, or Daniel, or an archangel, among others.[617] These feet appear to belong to male figures because women saints are normally not shown on thirteenth-century icons with exposed or bare feet. Also, women wearing imperial footware, such as the Virgin Mary or St. Catherine, typically have their buskins partly covered by their tunics, and are not fully visible as we see it here.

Looking more closely at this fragment, we can see that the background on which these feet appear is a dark blue painted over medium gray, and that the feet are standing on the slanted surface of what must have been the inner part of the bottom frame of the icon. Each of the two sandaled feet is handled slightly differently. At the left the foot is outlined in red and has gray-green shading on its upper left part. At the right the foot has a single sandal strap showing, which runs from between the toes up over the front of the foot with no division in the strap visible.[618] It is hard to see any red outlining, but there is brownish shading to the right of the sandal strap element. The left foot looks somewhat "up" in position compared to the right foot, which appears slightly "down." As for the buskin, it is brilliant red with two sets of simulated pearls in clusters of four, and two strips of pearls in lines across the middle of the buskin and farther up across the ankle. For this type of buskin, it is more lavishly decorated with pearls than any *comparanda* yet identified in the thirteenth century.

What we can say about these fragmentary images is that the two sandaled feet are more compact and unified than we see in icons identified as later thirteenth-century Western-influenced panels now in St. Catherine's. Similarly the foot in the buskin swells from the heel area toward the toes, but it is rather straight along the instep, with no curve or arch and does not appear as bulgy at the broad part of the foot, as we also see in the later examples.[619] The color of the buskin and its lavish decoration suggests that it might belong to one of the archangels, for example, St. Michael, as we see in the later icon of the Virgin and Child enthroned with St. John the Baptist (Fig. 200, App. no. 48/544).[620] It is impossible to say for certain who the saints in this pairing might have been, but one possibility is St. John the Baptist at the left and St. Michael the Archangel at the right.

As we have seen at Montfort, the main work of decoration there was done before *c.*1240, although work stretched from 1226 to 1266. It is obviously impossible to say much about a fragment of a portable icon such as this, in relation to the monumental decoration, which must have been done for the most part in the period of the 1230s. We cannot even be sure that this icon fragment belonged to a so-called Crusader icon, although it is likely because of where the icon was found, that is, in chamber "K" of this castle belonging to the Teutonic Knights. What can be said therefore, and is very important, is that, first, here we have a bit of archaeological evidence



122. Icon: Montfort Castle, App. no. 129, Icon fragment now in the Metropolitan Museum, New York. (photo: Metropolitan Museum, New York, gift of Clarence Mackay, Archer M. Huntington, Stephen H. P. Pell, and Bashford Dean, 1928)

indicating the presence of panel paintings in a Crusader castle in the Latin Kingdom in the thirteenth century, independent of the huge collection at St. Catherine's Monastery on Mount Sinai.[621] Secondly, apparently icons like this were being used by these knights for their worship, in terms of liturgical services or devotional prayers, or both. The question of exactly how they and other Frankish Christians were using these icons must be considered in due course.

Finding a single icon fragment in the setting of a fortified site like the castle of Montfort may seem to be both trivial and random, and could even be considered to be some kind of accident, if we cannot corroborate it with other evidence from more likely places. The Monastery of St. Catherine's clearly has the largest and most important surviving collection of medieval icons, and we have already seen specific evidence for Latin Christians going there on pilgrimage in the first half of the thirteenth century. Furthermore, we know from studies by K. Weitzmann and D. Mouriki that Byzantine icons were actively being produced there in the years after 1200, either by artists from Constantinople or by local artists with strong ties to Constantinople.[622] Indeed, Mouriki has published a set of four icons, which are closely related stylistically, and three of which bear an inscription naming the painter, "Petros."[623]

The four panels depict:

1. The Virgin *Blacherniotissa* between Moses and the patriarch of Jerusalem, Euthymios II;
2. The Virgin *Kyriotissa*, labeled here as the Virgin of the Burning Bush, between four holy monks of Sinai;
3. St. Procopius; and
4. St. Makarios of Egypt and St. Makarios of Alexandria.[624]

Mouriki analyzes the style and iconography of these panels in detail, demonstrating the special painterly characteristics of the artist and the particular Sinaitic imagery contained in these devotional images. On the basis of the extant inscriptions, Mouriki argues that Petros was both the patron and the painter of these works. Furthermore he may have been a monk whose given name was Procopius, but who took Petros as his religious name when he entered the monastery. Finally she argues that these panels should be dated between 1224, when the patriarch of Jerusalem, Euthymios II, depicted on the Virgin *Blacherniotissa* icon, died, and 1227, when the term of the archbishop and abbot of Sinai, Makarios, the namesake of two Sinai saints who appear on another icon, ended.

These four icons are purely Byzantine, indeed, specifically Sinaitic, in style and iconography, and they firmly anchor other Byzantine icons to this period, 1200–50, here at Sinai on the bases of their style. This style features new painterly and monumental formal characteristics, sometimes achieved with soft brushstrokes, sometimes with more linear designs, combined with new concerns for more naturalistic facial renderings, including the actual portrait-like head of Patriarch Euthymios II, and greater psychological immediacy and presence.

Painting at St. Catherine's appears to have enjoyed the benefits of Greek artists who fled from Constantinople during the diaspora in the years after 1204.[625] By the 1220s, however, Petros apparently developed his more painterly approach as one response to the diminution of artistic stimulation directly from Constantinople as the result of the Fourth Crusade. At that point, St. Catherine's was open to influences from other Orthodox sources.[626] Can we identify any icons in a Western-influenced or "Crusader" style at this time at Sinai?

Among the Byzantine icons at Sinai apparently dating from the early thirteenth century, we find two bust-length images of the archangels, Michael and Gabriel.[627] Both measuring approximately 55 × 45 cm, these medium-sized works appear strikingly monumental, perhaps echoing fresco painting as seen outside of Constantinople at this time, for example, in the Church of St. Mary at Studenica in Serbia, dated 1209.[628] Apparently intended for use on the templon as part of a Great Deësis, that is, in conjunction with the central figures of Christ, the Virgin Mary, and St. John the Baptist, these two works belong to what becomes a standard type, but they are among our earliest examples. They appear to be by different artists and probably should not be considered a pair; they illustrate the developing popularity of this iconographic theme in the first quarter of the thirteenth century.

It is striking to find among the large collection of icons at St. Catherine's a series of similar angels done slightly later. We have four unpublished archangels in a bust-length format, which appear to form two pairs, to which certain images of the Virgin Mary and Christ can be related in one case. They reflect later stylistic developments in the Byzantine and Crusader world, but possess certain iconographic and stylistic details, which suggest they were done at Sinai for Crusader patrons, or even by Crusader artists. The four angels were probably done by at least three different artists, and possibly one of the panels was repainted, altering its original appearance.

The two earlier angels are represented in a vertical composition, which stresses their heads and hands and deemphasizes their angelic wings: St. Michael (Fig. 123, App. no. 120/

1997),[629] looking right, and St. Gabriel (Fig. 124, no. 121/1998), looking to the left.[630] They both have the same type diadem with ends fluttering to each side of their head, the staff each carries is slightly different, and whereas Michael's halo has a painted outline, that of Gabriel seems to be tooled with round punched designs. Both wear the same garments, including an undergarment with an embroidered sleeve and jeweled cuff – each again slightly different – which is a favorite motif for Crusader painters in the later thirteenth century.[631] They both share a similar monumental style where the head is enlarged compared to the Byzantine examples cited earlier, and the oval shape of the face, the distinctive smooth curve of the jaw, the arrangement of their hair, and the large round eyes remind us of the fresco paintings at the Church of the Ascension at Mileševo, dated 1230.[632]

In fact, despite their similarities, however, they are different in style and in certain details of iconography. Both angels have white highlights, but the treatment of the faces and the draperies differs. On St. Michael's face the patterns of white highlighting in linear patterns is understated, whereas on the drapery it is more emphasized in terms of thicker forms with greater geometric clarity. With St. Gabriel, the face is rounder, not as long an oval; the highlights are more emphatic and the draperies have wash highlight zones that sometimes are defined with rectangular forms. Also Gabriel's clavus on his tunic is given spikey linear chrysography, whereas Michael's is given none. As for their hair, the front roll of Michael's hair and the tousled hair of Gabriel seem to be both related to the Mileševo angel, the former more than the latter, but they are clearly distinct from each other in the overall arrangement of the hair on the head and down the neck.

If these angels seem to reflect the Mileševo style rather indirectly in their individualistic interpretations, there are icons of two other angels at St. Catherine's that seem to have even more distant links, and which I am therefore dating later in the 1260s. These two angels, St. Michael (Fig. 202, App. no. 89/1414)[633] looking right, and St. Gabriel (Fig. 203, App. no. 85/1357)[634] looking left, are composed with greater breadth in which the wings form a fuller setting for the head, and the heads have a more pronounced and expressive inclination toward the central figures they are meant to flank. This head gesture is strengthened by the design of the diadems, which features both fluttering endings on the same side of the head. These angels are clearly a pair and were no doubt done by the same later Crusader artist working in a Franco-Byzantine style, judging stylistically from the more volumetric traits of the heads and the hair, and the nature and handling of the linear patterning of the wings and the draperies. Furthermore, both angels exhibit the same softly painted, fleshy faced figures with large round eyes accentuated with lines at the corners; they also both have nimbi with pearls studding their red outlines and both wear the same style embroidered sleeves and jeweled cuffs on their undergarments.

A glance at the two Byzantine icons of Michael and Gabriel mentioned earlier, with their expansively broad compositions, their more triangular faces, their harder drapery folds, the more intense highlighting of the faces, and their use of chrysography, makes the progressive changes in style demonstrated by the four Crusader angels quite apparent. How can we account for this stylistic change and development here at Sinai? Although the Milesevo parallel is meant to indicate a stage in the development of the new painterly and monumental style at St. Catherine's, I am not suggesting necessarily that one or more painters came to Sinai from the territory of the former Yugoslavia.[635] In this instance a more likely means of transmission between these two rather remote places is found in the vehicle of a detailed model book.

In fact, of course, we have a specific example extant, namely, the Wolfenbüttel Musterbuch, which Buchthal argued was made by a Venetian master in the 1230s.[636] The important drawing in this book for our purposes is the monumental angel based on the angel seated on Christ's empty tomb at Mileševo, one of the major figures in this model book, found on fol. 93r.[637] The significance of the Musterbuch here is to demonstrate that the work at Mileševo was known widely and reasonably promptly in the Mediterranean world by means of such sketchbooks. The artists at Sinai who did the icons discussed earlier for their Crusader patrons most likely were using a sketchbook like this, and following the specifications for these panels from their commissions.

We should remember that a sketchbook like this was a combined pictorial and iconographical guide, and to some extent a motif book. In this particular instance, the Musterbuch contains some thirty figures extant drawn on six folios, which are bound together with certain didactic texts. The nature of this book is to include, among other things, selected visual copies, that is, incomplete, disorganized, secondhand interpretations of Byzantine and Byzantinizing formulas.[638] We do not know much about the exact travels or functions of such books, but their mobility was impressive, as we know in this instance and in the case of the sketchbook by Villard de Honnecourt at about the same time.[639] Clearly, model books were instrumental in enabling artistic ideas to travel widely as we see here with the Wolfenbüttel Musterbuch, and as we have seen previously with the Freiburg Leaf.[640]

Parenthetically, we should not of course completely rule out the possibility of artists' travel to Sinai at this time, however. There is at least one conspicuous example of a painter coming to the Crusader Kingdom and the Monastery of St. Catherine's, apparently on pilgrimage in the 1220s. As we have also seen in Chapter 3, a German artist from the Rhineland came to the Holy Land *c.*1200 and made sketches, in the case of the Freiburg Leaf. In the same way, a Saxon artist apparently came to the Holy Land sometime around 1220 and studied the icons at the monastery on Sinai. Later he used his artistic study of these icons – most likely in the form of modelbook drawings – to paint the Halberstadt Cabinet.[641] This fascinating work includes the figures of Mary and the Angel Gabriel of the Annunciation on the doors of this cabinet. We find Sts. John and Paul on the exterior sides of the cabinet. Also there are Sts. Catherine and Kunigunde on the inside surfaces of the main doors. By careful analysis, it is clear that this artist must have known Crusader as well as purely Byzantine works of art. We can imagine that when he was at Sinai he may have made drawings from certain icons for a model book, which he took with him back to Germany. These would have been the drawings that he utilized in order to paint the Halberstadt Cabinet in the 1220s or the 1230s. The hypothetical drawings are no longer extant, but the Halberstadt Cabinet gives us the clear evidence that they must have existed.

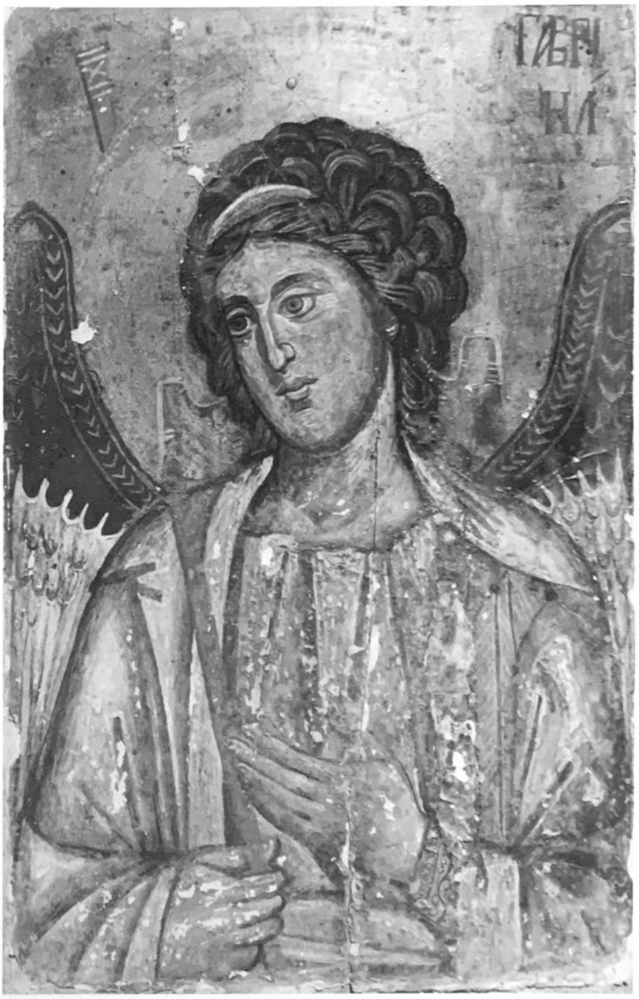
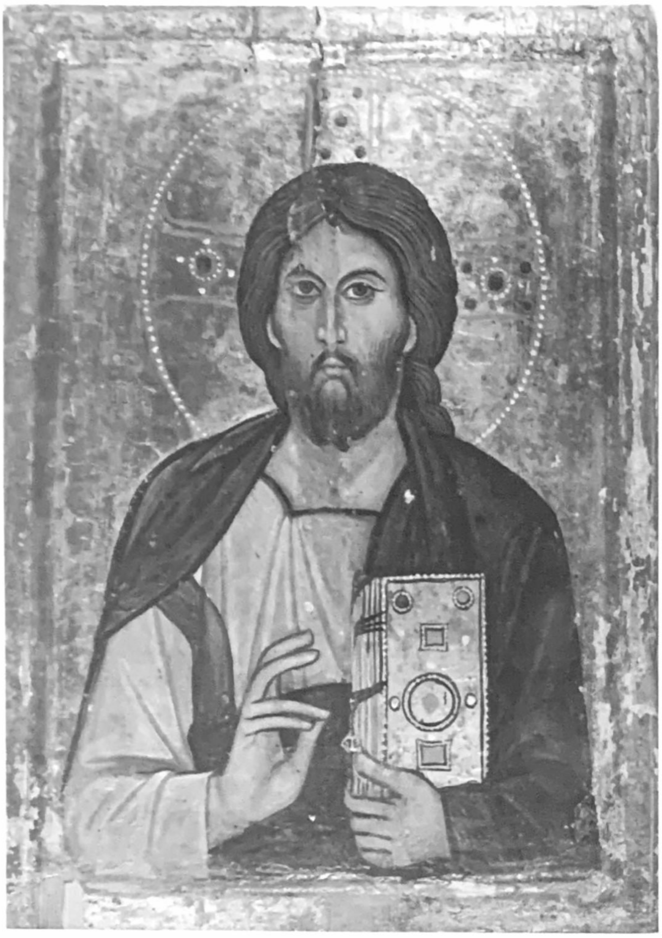
Returning then to our main argument, if we are correct to see the importation of models from Mileševo into Sinai in the 1230s, the importance of this development is considerable for the history of art in the eastern Mediterranean. It means that Constantinople was no longer the only major source of ideas and artists for the Orthodox world in the first half of the thirteenth century. Other places made their contributions, especially Yugoslavia and Cyprus, now that the Crusaders were established in the Latin Empire and Frankish Greece. It means that when Crusader pilgrims came to St. Catherine's, they could commission icons that would be done by artists that reflected not only the local St. Catherine's imperial Byzantine style but also others as well. It means that such models of Byzantine art were circulating to Orthodox and Crusader sites via model books made by, according to the evidence of the Wolfenbüttel Sketchbook, Venetian artists, among other possibilities, and they were carried by Frankish travelers, presumably also Venetians among others. Finally if such model books were circulating to Orthodox sites, they must have also been finding their way along the shipping and pilgrimage routes that such travelers followed into such major Crusader cities as Acre, Tyre, Tripoli, and Antioch in the Crusader States, not to mention Constantinople in the Latin Empire.

In light of the existence of the archangel icons for the Great Deësis, possibly commissioned by Crusader patrons as new embellishments for chapels in the Holy Land, are any of the main Deësis figures extant among the icons in the collection at St. Catherine's, Mount Sinai? In fact, there are several icons that may be possibilities for such a function. An icon of a bust-length Christ Pantokrator along with two others of the Virgin Mary and St. John the Baptist as intercessors exist at Sinai (Figs. 125–7, App. nos. 1/36, 2/37, 3/38). All three of these icons exhibit characteristics that link them with the second set of archangels mentioned earlier and should also be dated therefore in the 1260s.[642] Not only is their style exactly comparable to those of the archangels, but also we see the same curious contrast in these paintings between the beautifully painted heads and the rather clumsily drawn thick, heavy hands. Christ, the Virgin, and St. John – all three – also have the red-outlined nimbus studded with pearls that we have noted on the pair of bust-length angels.

Other intercessory figures of the Virgin or St. John, along with two images of the frontal bust-length blessing image



124. Icon: Sinai, App. no. 121/1998, Panel with bust-length St. Gabriel. (photo reproduced by permission of Archbishop Damianos and the Fathers of the Monastery of St. Catherine, and by courtesy of the Michigan-Princeton-Alexandria Expedition to Mount Sinai)



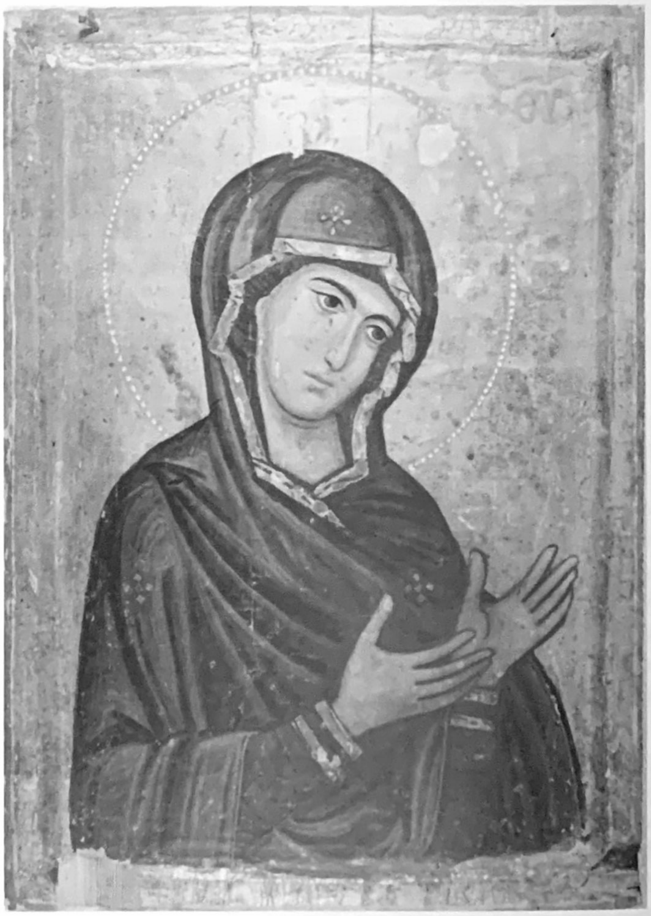
125. Icon: Sinai, App. no. 2/37, Panel with bust-length Christ from a Deësis group. (photo reproduced by permission of Archbishop Damianos and the Fathers of the Monastery of St. Catherine, and by courtesy of the Michigan-Princeton-Alexandria Expedition to Mount Sinai)

of Christ Pantokrator, that must have also belonged to such Deësis ensembles also exist. However, these works, including the Virgin (Fig. 128, App. no. 15/109) and Christ (Fig. 129, App. no. 16/110), another less well-done figure of Christ (Fig. 130, App. no. 77/1025), and a St. John the Baptist (Fig. 131, App. no. 45/470), all exhibit formal characteristics that indicate they must have been done slightly later, perhaps as late as the late 1260s. We shall accordingly also discuss them in Chapter 6, but it is important to mention them here in order to see that some of the painting traditions that can be identified in the Crusader East at the time of Louis IX are in fact continuations from work that had been done in the preceeding quarter of the century. Not all painting in the years of the 1250s and 1260s would be generated solely by Louis IX and the strong French influence that he stimulated during his residence in the Latin Kingdom.

Besides these icons, presumably commissioned by Crusader visitors at Sinai, which demonstrate that painting at St. Catherine's was changing and evolving on its own, there are other icons that appear to indicate the influence of other styles. Doula Mouriki has proposed that a pair of icons, a Crucifixion (Fig. 75, App. no. 32/285)[643] and a Hodegetria Dexiokratousa (Fig. 76, App. no. 57/679),[644] that is, the Virgin indicating the way to Christ in the manner of the sacred icon from the Hodegon Monastery in Constantinople, where Christ is seated in the Virgin's proper right arm, are both by Syrian artists from Cyprus working at Sinai. The icons are similar and might even have been configured as the two wings of a diptych, subject matter conceiveably originally drawn from the two sides of the Hodegon icon. As we have them now they both have striking red backgrounds, are done in the same somewhat folksy style presumably by the same painter, employ raised gilded and silvered gesso for the haloes of the figures, and exhibit a similar repertory of white pearls on black lines for the outside borders of the haloes and the inside frames of the two panels.[645] Both have inscriptions in Greek and distinctive harmonious browns and maroons for the dominant coloring set against the red backgrounds.

The only significant difference between the two panels as they currently exist concerns the outer frames. The outer frame of the Crucifixion icon, now quite damaged, was apparently originally decorated with raised and gilded gesso. The outer frame of the Virgin Hodegetria is now a bold floral design in painted medium blue with heavy flaking that might have originally indicated gesso decoration, but which is completely lost today.

Despite the characteristics just noted, Mouriki suggests there are other aspects of these icons that indicate Crusader patronage. She notes that even though the red grounds can be associated with Syrian painting in this period, the taste for red backgrounds is something we find with later Crusader patrons and could well be the case here. She thinks the swooning Virgin



126. Icon: Sinai, App. no. 1/36, Panel with bust-length Virgin from a Deësis group. (photo reproduced by permission of Archbishop Damianos and the Fathers of the Monastery of St. Catherine, and by courtesy of the Michigan-Princeton-Alexandria Expedition to Mount Sinai)

and the shape of the knot on the loincloth as well as the coloristic decoration of the latter on the figure of Christ in the Crucifixion are all Western iconographic features. In the Hodegetria, the figure of Christ wearing the red harness is associated with Cyprus, along with the iconography of his bare legs, as Mouriki has discussed elsewhere.[646] However, the strange gesture of Christ, which cannot be a blessing and seems to be a gesture of speaking, appears to be a misunderstood version of Christ's position in the Dexiokratousa.

These features taken together, the Byzantine origin of the iconographic ensemble and the basic imagery, the Cypriot and Syrian associations of iconography and color, and the Crusader taste for the various choices in the icons as they stand, are indicative of Crusader art. Given the presence of the original Greek inscriptions, these panels might have been commissioned by a Crusader to be given to the church at St. Catherine's or elsewhere. Mouriki recognizes the difficulty in attempting to date this somewhat folksy style, but she proposes a dating in the first half of the thirteenth century. It appears that this style corresponds well on its own terms to the new monumental style discussed earlier in terms of its interest in greater naturalism and its focus on physical and psychological presence. Both the swooning Virgin in the Crucifixion and the direct gaze of the Virgin at the onlooker in the Hodegetria icon indicate these concerns. As a result it seems reasonable to attribute these panels to the period 1225–50 at Sinai, and possibly even in the 1240s.

If we adopt as our working hypothesis therefore, the existence of vigorous Crusader patronage of icon painting at St. Catherine's during this period, as well as elsewhere in the Latin Kingdom, possibly at Montfort from which there is a bit of archaeological evidence, and even from Acre, from which we as yet have no certain examples, the question is, "how did these icons function for Crusader patrons?" As we have already suggested, Crusader pilgrims could have given icons as gifts to the Holy Sites they visited, a tradition for which goes back into the early twelfth century at Bethlehem.[647] Such icon donations could have served as *ex votos* in chapels of shrine churches for pilgrims. However, as important as the pilgrimage movement was, and as significant as pilgrims may have been in commissioning icons, icons cannot exclusively be seen as pilgrimage art among the Crusaders.

If we ponder momentarily the importance of the icon to the Orthodox, indeed, to the entire Eastern Christian presence in the Crusader States, and consider the question of the Orthodox legacy to Latin-rite Catholics in the Latin Kingdom, the

central issue that arises is the liturgy. Although few changes in the Latin rite were required by the Frankish settlers and increasingly in the thirteenth century, the clergy tended to be imported from the West; in fact there were some developments worthy of note that reflect the Eastern context of the Latin liturgy in the Crusader Holy Land.[648] The resident Frankish laity in the Latin Kingdom was clearly more "orientalized" than much of the recently arrived clergy after 1191. Partly as a result of their Eastern liturgical and devotional interests, a few changes can be noted, for example, Eastern saints were incorporated into Latin-rite calendars – a process that had started in the twelfth century for sure – Eastern votive lamps were allowed into the holy sites where Latin services were conducted, and notice was taken of solemn Eastern-rite services that gradually were allowed to be performed at appropriate holy sites. We recall, of course, that certain liturgical services had been taken over by the Latin clergy, especially at the main holy places, including unique events like the ceremony of the Holy Fire in Jerusalem on Holy Saturday at the Holy Sepulchre.

With these considerations in mind, we must also ponder the fact that one of the central religious and artistic aspects of the Eastern-rite liturgies and the spiritual life of the Eastern-rite Christian was focused on the icon. We must imagine, therefore, that just as Eastern saints entered the Latin-rite calendars, Orthodox clergy celebrated Eastern rites in the churches of certain holy sites, and Latin clergy had become accustomed to using holy images made by Crusader artists that were heavily Byzantine influenced in style and iconography in their new Crusader context, the practice of using icons – holy images – in the Latin-rite services must have also grown in importance. This means that the icons we have attempted to identify as linked to Crusader patronage at St. Catherine's on Mount Sinai and at Montfort are tangible testimony to greater Crusader interest in icons, mostly painted on wood panels, as pilgrimage gifts certainly, but also for public liturgical and personal devotional use.

One other important question related to the Orthodox liturgy that may have important links with Western developments concerns the templon screen, what is generally called later the iconostasis. The templon, which was undergoing certain changes in its configuration in the Eastern rite at this period, is in effect a partition with doors that effectively became covered with icons in a fixed order. The icons of the epistyle usually consisted of some version of the Twelve Feasts. Icons below were set into the interstices of the columns that supported the epistyle and on the doors. This icon-screen partition separates the sanctuary of an Orthodox church from the nave. During the thirteenth century the process by which the templon was being covered with holy icons was apparently still underway.[649]

The analogue to the templon in Western-rite churches was the chancel screen, the rood screen or what was called in France the *jubé*. In the early thirteenth century when the new mendicant orders were evolving, the Franciscans in particular develop the use of the *tramezzo*, about which we know of examples in Florence and elsewhere. The question that must be posed, even if it is beyond the scope of this discussion to investigate it here, is, "to what extent was the use of the *tramezzo* by the mendicant orders influenced by the Byzantine templon or iconostasis, including the placement of holy pictures on it as we know from the examples in the Church of Santa Croce and Santa Maria Novella in Florence?" This question can be refined further to ask more specifically, "what contributions did the Byzantine templon make to mendicant use of the *tramezzo* in the Holy Land?" Even more pertinently, "what possible use was made of holy images on some kind of chancel screen in Crusader churches in the Latin East that led to, influenced, and/or reinforced the development of the *tramezzo* in mendicant churches East and West?"[650] We shall continue to consider these liturgical developments and their impact on the figural arts in the later years of the thirteenth century.

CRUSADER MINOR ARTS

Fresco Painting and Stained Glass

Of other Crusader art in the media of fresco painting or textiles that must have been done at this time, nothing is left that has yet been identified. Yet there must have been many works, works related to the practice of decorating pilgrimage sites, to the ends of providing monumental holy images as part of the context of the liturgy, and to painting churches and monasteries newly built or rebuilt in towns and in remote places during this period, or for the purpose of providing vestments and luxurious textiles for the celebration of the divine services or for the handling and protection of holy relics. Nothing is left in an ecclesiastical setting that can surely be dated to the years between 1225 and the 1240s as yet, but several possibilities exist that may yield firm attributions in the future. We know for example that a number of Coptic monasteries in Egypt were decorated with frescoes and given icons in the thirteenth century, among which some may eventually be seen to date from this period and to show links with Crusader developments.[651] We also know, as we have seen at Montfort and at the town church at 'Atlit, that the Crusaders had begun the use of stained glass in some of their churches during this period.[652] Finally, we know that it is likely that fresco painting was used to decorate certain important interior rooms in Crusader castles, as in the *Logis du Maitre* at Crac des Chevaliers.[653]

Textiles

As for textiles, here is another medium for which much research is needed to evaluate the possible identification of work that may have been acquired by the Crusaders in special circumstances even if the sources of the fabrics were ultimately Byzantine or Islamic or Far Eastern. We know that Frederick II received important diplomatic gifts that included luxury textiles,[654] and the same may well have been true for other prominent Crusaders during this period marked by treaties and truces. Richard of Cornwall is said to have returned home in 1241 with rich cloth, which eventually found its way to Westminster Abbey.[655]

Pottery in the Crusader States

In relation to the discussion in Chapter 4 of the various kinds of Crusader pottery, the main new development between 1225 and 1244 is the advent of pottery specifically excavated at the site of Montfort. Unfortunately, when it was originally discovered in 1926, little was known about Near Eastern pottery during the Crusader period; hence the investigators at Montfort did not pay much attention to it and the original publication on Montfort has little to say about it.[656] In the meantime, the examples of pottery at Montfort have attracted little study for several reasons. Not only were very few finds reported, but also most of those finds were modest local work of earthenware with no slip or green glaze ware. Thus, recent scholarship has usually not been able to take the site of Montfort much into account, except in a negative way. Pringle reports, for example, that no proto-maiolica has been found from Montfort.[657] In that regard it is comparable to other inland sites in the Latin Kingdom, where the commerce of shipping did not afford easy importation of pottery from the West and much of what has been found is modest local ware for daily use. Pringle's comments in another context are applicable here for Montfort:

> The ceramic products of medieval Palestine... are relatively undistinguished; and in the 12th and 13th centuries they are poor even when compared with those of the Crusader states in Northern Syria and Cyprus. The finer ceramic products made locally in the Latin Kingdom of Jerusalem, such as the monochrome graffita wares derived from earlier Byzantine types or the slip-painted-and-glazed wares, represent in effect relatively commonplace table-cum-kitchen wares.[658]

At Montfort we only seem to find pottery of the most modest sort. Thus in contrast to 'Atlit, which has three main types – St. Symeon ware from the region of Antioch, proto-maiolica from southern Italy, and Cypriot graffita ware – at Montfort we cannot verify that even one of those types existed, even though there may be examples of St. Symeon ware among the best finds.

The situation at Montfort is an example of a site that needs additional investigation to follow up on the original research done in 1926. A major site such as Safed, which has not been much excavated but remains as a prime candidate for archaeologists to explore now that work has begun, could help fill in the gap that Montfort at present does not fill. Until these sites, and others like them, are fully investigated in light of our current knowledge of developments, their pottery cannot help us to understand the range of historical information available from studies in this field.

CONCLUSIONS

In the years 1210 to the 1240s we see once again the fact that Germans and the German Emperor played important roles in the major political, military, and diplomatic developments pertaining to the Latin Kingdom, and to some extent to the County of Tripoli and the Principality of Antioch, along with French and English Crusaders. Germans were not, however, prominent in the ecclesiastical hierarchy of the Crusader States, which continued to be dominated by French and Italian prelates. There are certain surprising aspects pertaining to the German political involvement at this time, during which Frederick II and then his son, Conrad, was king of Jerusalem. Despite the prominent role played by Emperor Frederick II, the impact of German aid to the Holy Land was diminished by the 1240s rather than being enhanced, despite the efforts of Hermann von Salza and the relatively newly organized Teutonic Knights. This occurred for several reasons. First, there was Frederick's unwillingness and inability to engage in military operations on the Crusade. Second, there was his unwillingness and that of his son to take up residency in the Holy Land as Latin king. Third, there was also the fact that his remarkable achievement in successfully concluding the Treaty of Jaffa in 1229 was handled in so idiosyncratic a manner. In the end, the benefits of this treaty were eventually swallowed up in the bitter civil war led by him and his imperial officers against the members of the Ibelin family. Therefore, it is the Crusade of Thibaut IV of Champagne and that of Richard of Cornwall that are remembered and extolled for their successful diplomatic achievements by continuing to maintain access to Jerusalem. They also even made it possible, in the final stage of negotiations carried on by the local rulers, 1243–4, to regain full access to the Muslim areas of the Holy City, areas which, of course, had formerly been controlled by the Templars and the Crown.

Unlike the Fifth Crusade, the Crusade of Frederick II made Christian access to the Holy City again possible, even though Frederick failed to refortify the Holy City. This was a great benefit to the Latin Kingdom, but the by-product of this expedition, the Lombard War, certainly was not. The two later Crusaders, Thibaut IV and Richard of Cornwall, also brought aid and contributed diplomatic successes of varying sorts. However, what they all failed to do in the long run – Frederick II included – set the stage for the catastrophic defeats suffered by the Latin Kingdom in 1244 when Jerusalem was finally lost to the Muslims for good and when the largest Crusader army to take the field in the thirteenth century was routed and destroyed at La Forbie.

Because of the civil war, because of the fragmentation of political leadership, because of the turbulent conditions, artistic developments are again only visible piecemeal. However, as in the preceding period, there is clear evidence of substantial work being done in both art and architecture.

In architecture, we have seen the massive construction projects for urban fortification and the major new castles that were built or added on to. We have seen the evident increase in the variety and quality of Gothic style in both church and military architecture, as well as in architectural sculpture and decoration.

Painting is the other area of innovation and significant development with the apparent establishment of the scriptorium of the Holy Sepulcher in the city of Acre as a source for high-quality aristocratic books as well as important ecclesiastical service books and cartularies. The other center that emerged as important for painting at this point was the Monastery of St. Catherine's on Mount Sinai, where we begin to see important icon painting for what appear to be Crusader patrons. New and expanding castle sites were also centers for artistic work, including painting. Panel painting emerged as a newly important medium, but we have seen glimpses of panel painting earlier. Stained glass appeared in the holy land as a new medium, however, reflecting its growing importance as a major medium of monumental painting in western Europe. In other media, like metalwork, we find that activity continued to surround the export of major relics as before, even if the details of the industry are mostly shrouded from our view. However, we also see that there was important metalwork brought to the Latin Kingdom from the West, just as there was a constant supply of Latin clergy sent to the Crusader East under the watchful eye of the ever-vigilant pope.

The clergy of the Latin Church in the Crusader States continued to maintain an important role as patron of the arts in this period. What we would like to know more about is the patronage of the new mendicant orders – the Franciscans, the Dominicans, the Carmelites – who also began their active role at this time, but for which we have little direct evidence so far. We would also like to know about how the Latin liturgy was changing, apparently making a new and more important place for holy icons, not only in terms of private devotions, but also in terms of public services.

The patronage of laymen, whether royal and aristocratic, whether soldier or merchant, whether individual or in groups, like the confraternities and even the commune active in Acre, is still somewhat unclear. The minting of coins obviously continued, but the choices made in the design of coins seem to be conservative and there was more emphasis on continuity of familiar types than in the kind of innovation we have seen earlier. Finally, the patronage of textiles and pottery is particularly difficult to assess because of the lack of evidence. It remains to be seen whether the lack of evidence should be interpreted as a diminution of production or of import–export activity.

We began this chapter with a series of question. What kind of responses can we give here in our concluding remarks?

1. In regard to the tremendous amount of architectural work done in this period, we can identify much of the new work at the new castle sites, but again it is problematic to see the work done in the building campaigns of 1225–44 on most of the urban fortification projects.
2. It is surprising that John of Ibelin is seen as a patron mostly only in his coinage in this period, whereas before this period we recall the magnificent Ibelin palace in Beirut as a work of special distinction. However, during the time of the civil war we find comparatively little otherwise to associate with him, despite the fact that as the mayor of the commune of Acre he must have played a central role in Acre developments in the arts. As for Frederick II, he was mostly in evidence in a political role, which translates to seals and coins in the arts. His patronage of manuscript illumination is just as mysterious in the Latin East as it is difficult to identify in Germany and the kingdom of Sicily. The fact is that we know of no major work of art commissioned by him in the Crusader States, other than urban fortification projects that he led, as, for example, at Jaffa. It seems odd, but Frederick II does not appear to have commissioned any major figural work of art while he was in the Holy Land, 1228–9.
3. The establishment of the commune of Acre between 1231 and 1243 clearly had an important impact on the political, economic, and military life of the city. It must have played an important role in making artistic activity possible in the city as well, although other than the possible commissioning of a seal for the commune, we know of no work the members of the commune corporately patronized. We could expect there might have been special commissions for their confraternity for related chapels and charitable activities, but as yet we lack the specifics. We can also expect that the commune would have had an impact on the architecture of the city and we can hope that the ongoing archaeological work in Acre will give us new and important information on how the architectural fabric of the city was changing during this time.
4. Given how important the Latin Church continues to be for the ongoing artistic activity in the Crusader States, we need more information on the possible individual commissions of major figures, like the patriarch of Jerusalem and the most prominent bishops. We also need more information on the emergence of the new mendicant orders, as they were established and began their work in the Crusader States. The Latin Kingdom is especially important for this because of the significance of the Holy Land for the Carmelites, whose order was founded there; for the Franciscans, whose founder came to the Holy Land during his career; and for the Dominicans, who began to appear in ecclesiastical positions of importance in greater numbers as the years went by. The rapprochement between the Latin Church and the Orthodox churches continued to be of special importance as well, because of the clear indications that Eastern influences were growing in terms of observances, services, and devotional practices.
5. The interaction between the Latin Kingdom and the Kingdom of Cyprus during this period was considerable, especially during the time of and because of the civil war. It is possible to see that some artistic activity was affected by this situation, as in the appearance of Cypriot-based styles in Sinai at St. Catherine's. Once Cyprus freed itself from the overlordship of the Holy Roman Emperor, it became more independent briefly. However, the long-term trend was for Cyprus to become more closely tied to the Latin Kingdom, particularly when, after the demise of the last Hohenstaufen king of Jerusalem, the kingship of Cyprus and Jerusalem was unified in one person again.
6. Finally, the period 1225–44 saw perhaps the most diplomatic activity of any comparable length of time in the Latin East, especially between Frederick and the sultan of Egypt, on the one hand, and between the various Muslim rulers of Damascus, Aleppo, Kerak, and Cairo and the various Crusade leaders on the other. This activity suggests that diplomatic interchange was more or less continuous, and intense some of the time. The level of diplomatic activity suggests that there was a significant amount of art exchanged as gifts, about which we wish we knew much more. There is no doubt that this is an important aspect of Crusader artistic production and interchange to be investigated in the future. Greater knowledge of these developments will not only increase our information about what art the Crusaders were capable of producing for use in diplomatic exchange, but it will also give us a way of identifying what Muslim art the Crusaders came to possess and what impact that art may have had on them. By the 1240s, mostly small signs of Muslim artistic influence on the Crusaders had only begun to be seen, but this was a development that would increase and expand in the second half of the thirteenth century.

In sum, we can look back on the whole period after the Third Crusade and offer some reflections observed in the broader perspective of Crusader artistic developments between 1098 and 1291. There clearly seems to have been a striking amount of military architecture produced during this period on the part of the Franks in the Crusader States, just as we saw after 1192. The amount of ecclesiastical architecture is very little documented, but the likelihood is that there was a considerable production. The problem is that it must have included a great deal of work in the form of convents, monasteries, and other ecclesiastical establishments in the major cities of the Latin Kingdom such as Acre, that is, in the form of living quarters and religious domestic dwellings that do not, or did not in these cases, produce much of an artistic presence. Our statement of likelihood is based on the very substantial presence of religious organizations of various types transplanted to the coastal cities, especially to Acre, and on the arrival of the mendicant orders in the Latin East during these years.

What is most problematic, however, is the peculiar and striking lack of identifiable figural art, excepting the various examples noted, from this entire period, 1192–1244. To some extent this cannot be simply the accident of later destruction or conservation. To some extent this sharply reduced production must be the result of a major change in patronage that was set in motion by developments in the kingdom. Whereas the ecclesiastical and the courtly art identified in the twelfth century before 1187 depended on a strong monarchy and a vigorous church hierarchy, the circumstances for church and state patronage changed dramatically after 1192. Just as the constitutional challenge to the monarchy grew in strength on the part of the Crusader lords in the first half of the thirteenth century, the royal presence in the Latin Kingdom also diminished in favor of regencies for absentee rulers. No doubt the weakness of the Crusader kings and their absence after 1228 is an important index to their lack of artistic commissions at a time when the barons were developing a strong taste for art. The church hierarchy is harder to account for, but their disorganization, their turnover, and to some extent, the nature of their responsibilities in the new circumstances must also have conditioned their reduced commissions as well. Although they sought to replace lost, missing, or destroyed liturgical books and objects, and attempted to set up new establishments, for example, some works appear to have been produced at very modest practical levels, some works seem to have been imported from the West, and in any case few luxury works are known to have been commissioned or to have survived. There can be no doubt that more remains to be learned about Crusader art between 1192 and 1244, but we can surely see that this was not a flourishing period for the art of the Crusaders in the Holy Land.

PART TWO

1244–1291

For such a long time now the faithful of Christ have worked anxiously for the liberation of the Holy Land, not without the spilling of much blood. But this kind of labour has not resulted in the liberation we desired, perhaps because the sins of the Christian people demand it, and there has been no help in it, not the slightest; there has been only hindrance, except in so far as it is seen to have been a means of the salvation of souls, because that land is a great ladder to the heavenly kingdom.

Innocent IV (21 July 1248)

TURMOIL IN THE HOLY LAND: 1244–1268

THE LATIN KINGDOM OF JERUSALEM: HOHENSTAUFEN KINGS, IBELIN *BAILLIS*, LOUIS IX, ITALIAN MERCANTILE WARFARE, AND MONGOLS VERSUS MAMLUKS

INTRODUCTION

Members of the Hohenstaufen dynasty were kings of Jerusalem from 1225 to 1268, but only Frederick II, who wore the crown very briefly, between 1225 and 1228, ever visited the Latin Kingdom. His son by Isabel of Brienne, Conrad, reigned from 1228 to 1254. With his father serving as regent after 1228, during the civil war (1231–6) and beyond, to 1243, Conrad, who resided mostly in Germany, certainly never set foot in the Near East. When Frederick II died on 13 December 1250 in Apulia, Conrad also became emperor of Germany and king of Sicily as Conrad IV, but he was never crowned.[1] He died four years later, in May 1254, while fighting papal forces in Italy, having been excommunicated by the pope.

Conrad's two-year-old son, known as Conradin, the Hohenstaufen duke of Swabia, thereby succeeded Conrad IV as nominal German ruler and as absentee king of Jerusalem. With Conradin in his minority, in the West, it was Manfred, Frederick II's illegitimate son, who carried on the war in southern Italy. In the Near East, the Hohenstaufens' absence on the part of both Conrad and Conradin left a vacuum that had been filled in principle by a regent who was his closest eastern heir. After 1243, when Conrad had reached his majority in the West, the Crusaders nonetheless exercised the legal principle that "a king who had come of age would be treated as though he was still a minor until he came East to be crowned and entered personally into the feudal contract with his vassals."[2] Therefore, King Henry I of Cyprus had claimed the regency after the death of his mother, Alice, in 1246, but the situation was more problematic when King Henry died in January 1253. In these circumstances, Conradin's nominal rights were protected, but Plaisance of Cyprus, the youthful widow of Henry I, now acted as regent for the Kingdom of Cyprus and claimed the titular regency in the Kingdom of Jerusalem. She was not officially recognized in the Latin Kingdom until 1258, however, because even she did not come to Acre to receive the oaths of allegience from the barons there until then. As Jonathan Riley-Smith succinctly characterized it,

> the law laid down that the regent should be the child's surviving parent, provided he or she came to Palestine to receive the fealty of the vassals of the Kingdom. If a parent could not make the journey, the child's nearest relative of the royal line in the East would be given the regency. It will be noticed that to relationship to the heir had to be added presence in the kingdom, both rules being reflected in the phrase *dreit heir apparent.* If no relative came to the East to claim the regency, the choice of regent lay with the High Court, a body consisting not only of all tenants-in-chief of the crown, but, by the *Assise sur la ligece*, of all rear-vassals as well.[3]

In the meantime, however, she sought to advance the claims of her infant son, King Hugh II of Cyprus, who was next in line as heir to the crown of Jerusalem after Conradin.[4]

The absence of a strong ruler and the political turmoil in the governments of the Crusader Kingdoms of Cyprus and especially Jerusalem was a glaring reality during the years between 1243 and the 1260s. Papal activity further complicated the situation. Papal anti-Imperialist policies stretched even into the politics of Outremer with regard to how the law of the *baillage* was implemented in the Latin Kingdom with reference to Hohenstaufen claims and with regard to commercial rights of the Italian mercantile cities, depending on their Guelf or Ghibelline sympathies. After the new pope, Innocent IV, following the policy of his predecessor Gregory IX, formally deposed Frederick II as emperor, at the council of Lyon (17 July 1245), Innocent also attempted to enforce the negation of all imperial rights in the Crusader East. Then the figure of Louis IX emerged on the scene as the organizer and leader of the next great Crusade.

Between 1248 and 1254, the turbulent political situation in Outremer tends to be largely overshadowed by the presence in the Crusader East of King Louis IX of France, as reported both in the Crusader chronicles and in modern historiography about the Crusades. Even though he held no official political position in the Latin Kingdom, Louis was the leader of the Crusade for better and for worse between August 1248 and May 1250, and he was entrusted with major administrative responsibility in the Latin Kingdom while he resided there between May 1250 and April 1254. In fact, the reins of government in the Latin Kingdom were held by John of Ibelin, lord of Arsuf, who was *bailli*[5] until 1254, then briefly followed by John of Ibelin, count of Jaffa, from 1254 to 1256. John of Arsuf resumed his position as *bailli* through the War of St. Sabas, 1256–8, a bloody conflict among the Italian maritime republics in Acre, to which I return later.

At this point, let us examine the record concerning the crisis in Outremer and Louis IX's six years in the Near East to evaluate the political and military predicament of the Latin Kingdom and Louis's impact on both the politics and the artistic developments during this time, 1248–54.[6] These developments break down conveniently into the period of Louis's preparation for and carrying out of the Crusade expedition between 1244 and 1250 and then the time of his residency in the Latin Kingdom between mid-1250 and the spring of 1254.

THE LATIN KINGDOM AND LOUIS IX'S EXPEDITION TO THE EAST: 1244–1250

The repercussions of the fall of Jerusalem in August 1244 and the catastrophic Crusader defeat at La Forbie the following

October were serious for the Latin Kingdom. Crusader military manpower was so weakened that any sustained attack by Sultan Ayyub, now reinforced by the Khwarismians, could have wiped out the remaining Frankish holdings. Unlike 1187, however, when Saladin was in control of a unified Muslim situation, Ayyub had first to establish his suzerainty over his relatives in Damascus and farther north. The Khwarismians were also something of a problem because as mercenaries they wanted a reward for their services. Ayyub would not allow them into Egypt for fear of what havoc they could wreak, so he set them loose raiding the Crusader Kingdom. Eventually, when they got involved in the fighting over Damascus in 1245–6, they ended up on the wrong side, were soundly defeated, and disappeared from the scene.[7]

At this point, Ayyub was sufficiently in control to organize an attack on the Latin Kingdom in the summer of 1247. Just as in 1244 and 1245, the Franks were still unable to protect their outlying fortifications. So first Ayyub took Tiberias, Mount Tabor, and Belvoir. Then he concentrated an attack on Ascalon in conjunction with an Egyptian fleet that sailed up from the south. Despite generous responses to their appeals for assistance and unexpected help from the weather, the Crusaders were only able to delay the Mamluk capture of the city. On 15 October, the Egyptian army took Ascalon. Once again they dismantled the fortress walls, walls that had been partly rebuilt several times, very recently by Thibaud of Champagne in 1240. Ayyub left Ascalon deserted and in ruins, no longer a Crusader bastion against Muslim assault from the south.[8]

With this important victory Ayyub paused to consolidate his gains, thereby giving the Latin Kingdom a much-needed breather. Despite the vulnerable condition of the Crusader States, help was on the way. A new Crusade was scheduled to leave for the Near East in 1248.

The Crusade of Louis IX: Preparations in France: 1244–1248

When word of the loss of Jerusalem to the Khwarismian Turks on 23 August 1244 reached western Europe in the fall, the pope prepared to declare a new Crusade to regain the Holy City. King Louis IX, although seriously ill with a malarial infection in the abbey of Maubisson near Pontoise, vowed to take the Cross in December 1244, even before the Crusade was officially proclaimed. The Noailles Continuation describes the dramatic events:

> In France King Louis was taken very ill, so much so that he lost all power of speech and was thought to have died. His mother Queen Blanche, his wife and his brothers broke out in lamentations, thinking him dead, and they sent for clergy to conduct his funeral service. Then at that moment he breathed, opened his eyes, looked round him and said,
>
> "Fetch the bishop of Paris." In joy and happiness, all their grief changed to delight, those who were with him sent for the bishop. When the king saw him, he said,
>
> "My lord bishop, give me the cross for the Holy Land beyond the sea." When the queen mother, his brothers and the queen his wife heard that, they knelt to him and said,
>
> "My lord, in God's mercy, wait till you are better! Then you can do what you like." This made him angry and he said,
>
> "You can be sure I shall neither eat nor drink until I have the cross for Outremer on my shoulder." Then he called the bishop of Paris back to him and asked him again for the cross. The bishop did not dare refuse, so he took a piece of silk ribbon, folded it into a cross, knelt down weeping in front of the king and offered it to him. The king took it, kissed it, held it to his eyes and then had it fastened to his shoulder.
>
> "Now I am cured," he said. You may be sure that the weeping and lamentations inside and outside his bedroom were as great as when they thought he was dead.
>
> "When the king was up and better, he had letters written and sent to inform them in Syria that he had taken the cross; let them take comfort, defend and equip their cities and castles, for with God's help he would soon be in the Holy Land."[9]

The Rothelin Continuation also reports the circumstances, slightly differently and in some colorful detail, but without the references to Syria.[10]

So well-known did this incident become that after his canonization proceedings, conducted between 1272 and 1297, images of the king receiving the Cross in his sickbed became popular in the illustrated continuations of William of Tyre's *History of Outremer*, dating mostly *c.*1300 and later.[11] As William Jordan has pointed out, however, this incident was seen quite differently in 1244 when Louis's vow was considered something of an aberration by many in France, an ill-chosen course of action that could have a dire impact on the kingdom if carried out.[12]

Six months later, in June 1245 at the Council of Lyon, Innocent IV formally issued the call for a new Crusade in his bull "Afflicti corde":

> Pierced to the heart as we are at the deplorable perils of the Holy Land, and especially at those which are known to have recently happened to the Christians living there, we desire, with our whole heart, to release it, by God's assistance, from the hands of the wicked, and, with the approbation of the sacred council, we determine, by means of the Preachers and our special messengers, to intimate to all true Christians who have made arrangements to cross the sea, that they are to prepare to assume the cross, and to meet at a convenient time for this purpose, and at suitable places, whence they may proceed to the assistance of the Holy Land, attended by the divine blessing as well as that of the Apostolic See.[13]

Compared with earlier calls for a Crusade, this bull is rather dull and matter-of-fact. But no matter, there could not have been a more motivated, serious, organized, or devout leader than Louis IX for such an endeavor. This is underlined by the story told by Mathew Paris about his vow. After Louis IX had recovered from his illness and he was again in good health, his mother, Blanche of Castile, and the bishop of Paris, William d'Auvergne, attempted to dissuade him from the vow he had made under the difficult circumstances of his illness. "My lord king, remember that when you took the cross, making so important a vow hurriedly and without advice, you were ill and, to tell the truth, your mind was wandering. Blood had rushed to your brain so that you were not of sound mind and the words you then uttered lacked the weight of truth or authority."

> To this the king, no little moved, replied: "You claim that the change in my senses was the cause of my assuming the cross; there now, as you wish and have argued, I shall lay down the cross, handing it over to you" and, raising his hand to his shoulder, he ripped off the cross with the words, "Lord bishop, here is the cross which I assumed; moreover, I resign it to you." At this, all those sitting around expressed their

> intense joy, but the lord king, altering his tone of voice and countenance, said: "My friends, certainly I am not now deprived of my reason or senses, nor am I powerless or infirm. Now I demand back my cross. He who ignores nothing knows that nothing edible will enter my mouth until I have again signed myself with it." When those present saw this they recognized that the hand of God was here. . . . We have recorded this business fully and exactly so that everyone appreciates the constancy of the most Christian king of the French in the service of Christ.[14]

It is in this episode reported by Matthew Paris that we truly glimpse something of the personal fervor which the king expressed for the Crusade. Not only was Louis IX totally committed to the Crusade, but he was also ardent in his zeal. In him the fire of crusading as an act of love burned brightly.[15] In the history of crusading, there had rarely if ever been one so dedicated to the cause.

As a public demonstration of his firm commitment to the new Crusade, Louis called a great assembly in Paris on 9 October 1245. Here Eudes of Châteauroux, cardinal bishop of Tusculum, preached the new Crusade and many important French churchmen and lords took the Cross.[16] Inside French territory, Louis vigorously recruited French barons, an initiative that was especially successful with rebellious lords in the south.[17]

Louis's idea of this expedition, however, was that it be a truly European Crusade. To this end, he sought the support of the great rulers and attempted to engage the attention of the pope away from his obsession with Frederick II and the empire. Louis IX steadfastly pursued his cause based on two principles, as Jordan has described them: "First, where Louis had influence, he should use it to bring concord to intra-Christian rivalries. Second, where it was possible he should turn the attention of other princes to the crusade."[18]

Despite his best efforts, however, he did not succeed in attracting Henry III of England, Frederick II, Haakon of Norway, or any major Spanish rulers to join the Crusade. Even the king's gesture of protecting the pope from the menace of the emperor, by allowing him to take up residence near the "borders" of France, at Lyon, did not deter Innocent IV from his struggle against Frederick II. Despite these setbacks, it is a dramatic demonstration of his resolve and his devotion to the Crusade that even if he could not bring peace to the European world, he never wavered from his dream of conquering Jerusalem and the Holy Land.

Fortunately King Louis was much more successful within France in planning, organizing, and financing the Crusade than he proved to be in attempting to win aid from his peers. To accomplish the goal of organizing the Crusade in France and to provide a solid basis on which to rule – for himself and for his regent, Queen Blanche – Louis sought to reform his government. Although the central government – the chancery, the financial branch, and the judicial arm – was, relatively speaking, efficiently controlled by the king, the means of transmitting the king's policies and important information to the provinces and his ability to collect taxes from these outlying territories were inadequate. What was needed was to root out dishonest officials and to establish reliable regional administrators, that is, dependable *baillis* or senechals, in place. This Louis proceeded to do in 1246 in conjunction with the appointment of mendicant *enquêteurs*, Franciscans and Dominicans, who were sent out "to collect and adjudicate complaints about the activities of royal officials."[19] These *enquêteurs* appear in the written records during 1247. Louis's decision to recruit mendicants for this difficult job can be explained by his need for honest and efficient functionaries, by the fact that these friars represented the new wave of Christian piety that he wished to promote, and by special arrangements with the heads of the orders who were apparently willing to support this venture.[20] Jordan assesses the results of these efforts as follows:

> Louis's accomplishment before the crusade was distinguished: by the end of 1247 and increasingly thereafter his demands on his kingdom could be made through men whose fundamental loyalty was to him, who owed their positions directly to him, and who were dealing with a population that for the first time, as a result of the friar-*enquêteurs*, may have desired genuinely to help him in the great crusade he planned. When Louis had first sworn the crusader's vow in December 1244, it is unlikely anyone would have ventured to believe that these developments were possible.[21]

These reforming efforts affected the preparations for the Crusade in a number of ways. Not only was royal administration made more efficient and honest, so that injustice and the profits of injustice could be eliminated so far as possible, but Jean Richard points out that by this royal example a spirit of moral preparation, moral reform in effect, was also widely engendered in those taking the Cross.[22] Jean de Joinville, for example, tells the story of how he prepared by calling a meeting of his men on the Friday after Easter, 1248. At this gathering he spoke: "My friends, I'm soon going oversea, and I don't know whether I shall ever return. So will any of you who have a claim to make against me come forward. If I have done you any wrong I will make it good." Then he left the court in order not to influence their deliberations and afterward agreed to whatever they recommended, without objection.[23]

One essential need for the Crusade was, of course, raising a well-organized army. As the result of vigorous recruiting, it was possible to get many barons and many prelates to take the Crusader vow, even if a surprisingly large number were eventually unable to fulfill their obligation. Nonetheless, by 1248, Louis commanded an army of approximately fifteen thousand knights, mounted sergeants, and infantry. The king accounted for about half these men himself, and other leaders provided the other half.

The army that was raised would then need to be provisioned and transported. Arrangements had started as early as 1246 to contract for ships from Genoa and Marseilles. Port facilities had to be located and supplies had to be acquired, transported, and stockpiled. Agents were sent out to make careful arrangements for the provisions in France and in Cyprus. Jean de Joinville was impressed with the abundant food and wine the Crusaders found waiting for them on Cyprus.[24] He notes that the wine barrels were stacked so high as to look like barns, and the grain was heaped to form mounds that looked like independent hills. By any standard, and no matter how much fraud and pilferage there may have been, establishment of a thousand-mile supply line that adequately provisioned the troops was a remarkable achievement.

As his point of embarkation, Louis decided to use the port of Aigues-Mortes, a new town the king had acquired from the abbey of Psalmodi in 1240. Aigues-Mortes, south of Nimes and east of Montpellier, in the marshy lands surrounding the delta at the mouth of the Rhone River, had the advantage of being under royal control, and it had at the time a natural harbor. The king no doubt wished to avoid the problems that had beset earlier expeditions when dealing with established maritime powers, such as what had happened with the Fourth Crusade at Venice, but Aigues-Mortes had its disadvantages as well. The town was small, it was not an established commercial center, and it was not used to handling the provisions for such a large fleet. The local water was brackish, and all freshwater supplies had to be transported in for the army. Furthermore, the town walls and the harbor had to be built de novo, the inner harbor of the port was prone to heavy silting, and there were strong winds that buffeted the ships during outfitting and loading. Despite these problems, the town walls were largely constructed – made of wood with only the massive Tour de Constance[25] built of stone – and the harbor put in functioning order; supplies were gathered, and the ships arrived, while the task of raising money went forward.

To finance the crusade, the Council of Lyon in 1245 had levied a tax of one-twentieth of ecclesiastical revenues, an amount that was increased to one-tenth of revenues in France. Although little money was collected outside of French territory,[26] in France significant money was raised, and the tenth was extended for five years. Strayer estimates that the French tenth yielded about 190,000 livres per year, or 950,000 livres for the five-year period.[27] Overall the Crusade was officially estimated to have cost the king 1,537,570 livres,[28] which demonstrates that the French clergy ended up paying the largest part of the expenses. When looked at in comparison to the annual revenues of the crown at 250,000 livres tournois in this period, most of which was committed for domestic use, it is clear how important the financial support of the Church was. It is also evident that the king's newly reformed administration was successful in collecting its revenue more efficiently, and even finding new sources of revenue to pay for unforeseen expenses.[29]

Sainte Chapelle in the Context of Crusade Preparations

It should not be overlooked that during the entire period of preparation for the Crusade in France, Louis IX was involved with his most important royal artistic commission in Paris during the 1240s: the construction and decoration of Sainte Chapelle on the Ile de la Cité.[30] Commissioned to hold the holy relics of the Passion of Christ, which Louis had recently acquired from Baldwin II, the Latin Emperor of Constantinople, and other sources, Sainte Chapelle was a declaration of royal ideology, programmatically linking the Capetian dynasty with the Holy Land. Branner argued that the building project was begun in late 1241, after the second shipment of relics had arrived in Paris in September.[31] A papal bull from May 1244 granted the king permission to found a college of canons for the chapel. When it was dedicated on 26 April 1248, complete in all its details, Sainte Chapelle was clearly a major artistic statement of royal presence by the current king in Paris. Even more significantly, it also presented a program of symbolism and narrative illustration that linked the Capetian dynasty with the Holy Land and the anointed Old Testament kings, especially Solomon.[32]

Briefly stated, we can think of this program in terms of the following components. In the architecture, "one aspect of Louis's strategy was to rival Byzantium by delineating a new Holy Land within the confines of the palace complex in Paris, another was to create in architecture a Christian and Capetian equivalent to the building complex of King Solomon in Jerusalem, including the great *Templum Domini.*"[33] And "the relics of the Passion symbolized that earthly Jerusalem which it was Louis's deep desire to reconquer for Christ."[34] The list of relics is long and impressive.[35]

The lavish interior figural decoration of Sainte Chapelle included frescoes, sculptures, and stained glass, intended to provide a setting for the presentation of the holy relics. The frescoes consisted of a series of forty-four quatrefoils depicting Christian martyrs who gave their lives for the faith.[36] These images, which emphasized the human sacrifice and celestial rewards of martyrdom must have had special resonance for the king as he prepared for his Crusade.[37] The sculptures consisted of the Twelve Apostles standing as pillars of the church, at the bases of the buttresses along the side walls. Although by the thirteenth century, comparatively speaking, such apostles were a familiar metaphor in sculptural programs, these apostles contain special significance here. "Each apostle holds in his hand a disk containing the ceremonial cross of consecration that is normally inscribed onto church walls at the time of the dedication. By carrying this attribute, a striking and unusual iconographic detail, the apostles are not only an eternal presence in the celestial Jerusalem, they are also active participants in the ceremony consecrating the new Holy Land in Paris."[38]

The stained-glass program is clearly strongly related to a series of densely illustrated Bible manuscripts done in Paris between 1215 and the 1240s, including the *Bibles Moralisées* and the Morgan Old Testament Picture Book, Morgan MS 638. In the 1,100 scenes found in the stained glass, there is enormous emphasis on Old Testament imagery (650 scenes), with a focus on "aspects of biblical kingship, including the orderly succession of the rulers of the chosen people, the defense against idolatry, and the necessity of holy war to achieve the objectives of the faith." In this imagery "the biblical heroes are presented in contemporary dress, many in the guise of French crusaders. Such an artistic conception is most readily understood in the context of the Crusades; the Franks, viewing themselves as the rightful descendents of the Old Testament heroes, were comparably engaged in a battle for rights to the Holy Land."[39] In the chevet, a Christological cycle links the Old Testament stories to the New Testament events that lead up to the Incarnation and the Passion. The New Testament scenes provide a narrative setting for the four lancet windows that depict the history of the relics of Christ's Passion. "Within the relics narrative, the French king is presented, like his predecessors Helena and Heraclius, as a savior of the Passion relics. Yet because he is portrayed in the standard dress of a French monarch, Louis is indistinguishable from the biblical kings depicted throughout the stained-glass program.... Louis IX had assumed the mantle of biblical kingship and was nothing less than the legitimate heir to the rule of David and Solomon."[40] The history of the relics windows in one sense form the climax of this cycle of scenes in stained glass, a climax centered on King Louis IX.

"Frenchmen, from the first moment they received the relics, considered them something which gave their kingdom a special connection with the heavenly kingdom, but . . . the relics did not find their true place in the religion of French monarchy until Louis IX swore the crusader's vow. So deep was the association, indeed, in men's minds, that the legend grew up and was memorialized in art that Louis, the crusader, had personally brought back the relics of the Passion from the Holy Land."[41]

How is it possible that such a remarkable commission was underway at the same time that such vigorous attention was being given to the direct preparations for the Crusade? The construction of the Sainte Chapelle has been estimated at 40,000 livres tournois, a substantial sum, and the total cost of the entire project, including the payments made to Baldwin II for the holy relics of the Passion, has been put at 100,000 livres tournois. We know little about certain details of exactly when these payments were made and for what, but the impact on royal commissions is clear. Jordan quotes and summarizes Branner's findings:

> "During the Crusade of 1248–1254 most building operations in the capital were suspended or slowed down." He also demonstrated that, at practically every major construction in northern France with which the monarchy had associated itself and invested its resources, reductions in outlays can be associated with Louis's preparations for the crusade. And no new efforts were undertaken once he took the vow. It was crusading projects, like the building of Aigues-Mortes, which consumed these savings in a dramatic trade-off.[42]

In sum, far from diverting Louis from his labors for the Crusade, Sainte Chapelle provided the king with a magnificent vehicle for an artistic statement of his ideals in relation to the Crusade. The fact that it was given this attention at a time when other projects deemed less important for the Crusade effort were slowed, stopped, or even terminated,[43] puts Sainte Chapelle in a special category of importance. Sainte Chapelle demonstrated that, by pursuing its construction and decoration in the midst of preparations for the Crusade, Louis IX viewed certain art and architecture to be an integral part of his royal Crusade agenda. As we shall see, what he achieved in Paris and at Aigues-Mortes in the 1240s has strong parallels with what he also achieved mutatis mutandis in the Latin Kingdom from 1250 to 1254. The cost of his projects in the East would be even more expensive, however: There was more construction than the king could have imagined, and there were unforeseen expenses.

A "HISTORY OF *OUTREMER*" FROM THE ROYAL PARISIAN ATELIERS

Sainte Chapelle was the largest and most important monumental and somewhat public artistic statement pertaining directly to Louis's upcoming Crusade, but more privately there was also evidence of the king's interest at court, in terms of manuscript illumination. The earliest extant illustrated "History of *Outremer*" manuscript from western Europe is Paris, B. N. MS fr. 9081, a codex containing William of Tyre's text translated into Old French.[44] This manuscript contained originally twenty-two historiated initials, of which four have been cut out and are now lost. We can see from those that remain, however, what a remarkable cycle of miniatures this manuscript contains. We can also see that the style of the miniatures in this manuscript places it in Paris in the context of the workshop(s) that a few years earlier had executed the *Bibles Moralisées*, shortly before 1240. Finally, we can observe that this beautifully executed codex, with charming historiated initials decorated in the manner of the *Moralized Bibles*, is supplied with captions to identify the very detailed images for the aristocratic reader. What are the special features of this illustrated codex that pertain to Louis's upcoming Crusade, and what is the special significance of this manuscript?

The unusual nature of this illustrated cycle is apparent when considering the specific detail given to the scenes, with royal and aristocratic figures specified consistently. Seemingly ordinary scenes are depicted with great sensitivity for visual narration, and the choice of scenes to be illustrated is extraordinary and fascinating. Chivalric behavior is recognized, as at Book 10 where King Baldwin II cares for the captured wife of an Arab emir. The majority of scenes are unconventional when compared with the standard cycles in French manuscripts which appear later on. At Book 12, for example, we find the king granting the founder knights of the Templars living quarters, unique in all of the illustrated "History of *Outremer*" manuscripts from the East or the West. The artist's storytelling ability is exemplified also at Book 19, where Crusader messengers come to Cairo. There at the caliph's palace, the sultan kisses the foot of the caliph while the messengers looks on. We are charmed by the narrative, which although true to the story in the text, represents all the figures as French – the sultan is a French noble, the caliph is a French king – and do things in a French manner. Obviously the French artist conceived of the kissing of the caliph's foot as the most remarkable part of the ceremony and duly recorded it. Historically, according to William of Tyre's text, however, the most unusual feature of this audience was the caliph's willingness to set aside Muslim custom, bare his hand, and shake hands with Hugh of Caesarea as an equal, signifying his agreement to the terms of the treaty renewal.

The narrative cycle in the historiated initials is filled with picture after picture like this, and these pictures are given captions at the bottom of the page to inform the reader of their contents. Thus these captions ensure the reader's understanding of the detailed and accurate visual presentation in the images. No doubt these captions were first intended to be used for the artist as guides to his painting, but their language and the fact that they are written in such a bold, clear bookhand, not to mention the fact that they were retained when the manuscript was completed, is evidence for their unusual function.[45]

Both the extraordinary program of decorations and the unusual captions that are provided for the narrative cycle, when combined with the fact that stylistically this codex is illustrated in the manner of the Toledo and Oxford/Paris/London *Moralized Bibles*, indicate that this codex was a commission from someone at the royal court. We cannot say directly and specifically perhaps that the king himself commissioned this book, but it was clearly commissioned by someone who was thinking seriously about the upcoming Crusade and wished to know about the Crusaders in the Holy Land. That person could very well have been Louis's mother, Queen Blanche of Castile. Either she might have commissioned this wonderful book for herself or someone could have commissioned it for her, in either case with a view to her son's upcoming expedition. Certainly her patronage of the *Moralized Bibles* can link her to a book done so faithfully in the style of those huge Bibles, not to mention the excellent quality of this "History of *Outremer*" manuscript and its miniatures, and the special deluxe feature of its captions. Finally, the specific and detailed content of these pictures, with emphasis on the Crusader kings, nobles, and knights of French ancestry, clearly provides a focus on the special contribution of French Crusaders to this cause.

In conclusion, then, we have at least glimpsed what a detailed and interesting survey of events in the history of the Latin Kingdom pertinant to French royalty is provided by this manuscript in terms of its miniature cycle. Even though we cannot definitively connect this book directly to the king or his mother on documentary grounds, it clearly provides evidence of heightened awareness for the upcoming Crusade at his court. And we should not overlook the fact that this manuscript also has special significance. It is one of the first extant examples of a decorated secular book in the vernacular Old French from Paris, marking a new departure with the appearance of illustrated secular literature, patronized and supported apparently at the royal court in Paris. How fitting such a work was apparently commissioned during the time of preparation for the Crusade, in 1244–8, contemporary with the Sainte Chapelle.

Louis IX Sets Out on the Crusade: 1248

In discussing the emotional, material, and spiritual aspects of King Louis IX's preparations for the Crusade, William Jordan provides a welcome *aperçu* of the ceremonial acts that formed an essential part of the royal departure. The first of these *acta* was a ritual tour of the royal domain, starting with the northern part in the winter months of February, March, and early April. This *tournée* was, of course, the opportunity for the king to dispense justice and to present himself to his people as their king and as royal Crusader, sometimes in dramatic fashion. Jordan conjures up one such ceremony at Chambly, north of Pontoise, on 8 March 1248.

> The king's visit is supposed to have been the occasion of the very first celebration of *Bois-Hourdy*, a festival replete with torchlight parade and bonfire. If we let our imaginations go, we shall conjure up a picture of the king leading this procession – perhaps it has come together from various neighborhoods to the central square; and at the moment when the torches are put to the straw for the bonfire, the royal visitor is illuminated: soon he will take leave of this town and his kingdom to do battle with the enemies of Christ.[46]

Toward the end of April when this part of the *tournée* was accomplished, Louis was back in Paris to dedicate Sainte Chapelle. The dedication was important, but it was only the midpoint of his royal progress; Sainte Chapelle would have an even more significant function later on in the departure rituals. At the end of April and in early May, Louis completed his *tournée* with visits to the southern part of the domain: Etampes, Toury, Châteaudun, and Perseigne. On his return to Paris after the progress was concluded, Sainte Chapelle assumed its new role as a major ceremonial site for a French royal crusader. Jordan reconstructs the components: an exposition of the holy relics of the Passion, the granting of additional indulgences, and the presentation of a precious relic – a thorn from the Crown of Thorns of Christ – to delegates from the king of Castile.[47]

After the focus on Sainte Chapelle, the king turned his attention to the Cathedral of Notre Dame. There his Crusade pilgrimage formally began. The Minstrel of Reims describes a memorable scene:

> When the king had made ready for his journey he took his wallet and his pilgrim's staff at Our Lady's in Paris; and the bishop sang mass for him. And he set forth from Our Lady's – he and the queen and his brethren and their wives, unshod and barefoot; and all the congregation and the people of Paris convoyed them so far as Saint-Denis, with weeping and with tears. And there the king took his leave of them and sent them back to Paris, and he wept bitterly when he parted from them.[48]

Almost every crusader's departure from his loved ones was extremely difficult and very emotional, and Louis's was no exception:

> The queen his mother tarried with him and accompanied him yet three days, in despite of the king. Then he said unto her: "Fair, sweetest mother, by that faith that ye owe me, turn back incontinent. I leave you my three children for to guard – Lewis, Philip, and Isabel – and I leave you to govern the kingdom of France; and in sooth know I that they will be well guarded and that the kingdom will be well governed."
>
> Then answered him the queen, weeping: "Fair, sweetest son, how can it be that my heart shall suffer the severing of me and thee? Surely it will be harder than stone if it divide not into two parts; for thou hast been to me the best son that ever mother had."
>
> And on these words she fell down in a swound; and the king raised her up and kissed her, and he took his leave of her, weeping. And the queen swooned yet again and remained a long time in a swound; and when she was come again to herself she said: "Fair, tender son, never shall I see thee more; that my heart telleth me."[49]

Sad to say, her intuition was correct.

The king put aside this sorrowful parting and now made his way in short stages southward, via Sens, Vézelay, and Lyon, to the new royal port of Aigues Mortes. There he embarked in his ship, the *Montjoie*, for the Near East on 25 August 1248. He arrived in Limassol on Cyprus, 17 September 1248, and established camp to wait for the army to assemble. Shortly thereafter, Jean, sire of Joinville, arrived on Cyprus as well. Joinville would later become the king's friend, vassal, and trusted advisor during the Crusade, and much later he became the king's biographer. According to Jean de Joinville, Louis would have sailed on to the Holy Land immediately after his arrival at Limassol, but his brothers and the other barons there prevailed on him to wait for the army to gather. It would be a long wait, from mid-September 1248 until the end of May 1249.

The Crusade of Louis IX – Preparations on Cyprus: 1248–1249

Although the wait would prove onerous for Louis once he arrived in Cyprus, he was given a warm welcome by King Henry of Cyprus and his most important nobles.[50] As mentioned earlier, an impressive amount of supplies had been gathered. The French king and his army camped near Limassol for nearly eight months,[51] where they were well provisioned but also where sickness broke out, causing many deaths. Fortunately, stragglers and others joining the army late reinforced its ranks and enabled Louis to maintain his troops at full strength.

For his own part, Louis IX immediately became actively involved in Near Eastern affairs, both in an effort to prepare for the upcoming military expedition and to promote the Christian faith, effectively continuing the preparations he had begun in western Europe. The first encounter mentioned by Joinville concerned two envoys sent to Louis IX by the Mongol general in the Middle East, Elijigidei; they arrived in Kyrenia on 11 December. The king and his entourage met with these envoys in Nicosia on 20 December 1248, where he was staying in the royal palace as the guest of Henry I. The envoys carried a letter to the king, which brought greetings from Güyük Khan, king of the world, wishing the Christians success in their battle with the Muslims.[52]

The Rothelin Continuation reported the message brought by the envoys to be that their king was Christian, as were many of his subjects, that Elijigidei would support the Crusaders to avenge the depredations of the Khwarismians on the Mongols and that in the spring the Crusaders should attack Egypt just when the Mongols would attack the caliph of Baghdad.[53] Joinville also records a much briefer description of this message, without the erroneous claims that the Mongol leaders were Christians, but with the same Mongol willingness to aid the Crusaders against the Muslims. The purpose of this message,[54] written as soon as Elijigidei had heard that the Crusaders had landed on Cyprus, was perhaps twofold. First, the Mongols wanted to establish favorable relations with the Crusaders, whose military presence they respected. Second, the Mongols quite possibly wanted to enlist Louis's aid in getting the Latin clergy to give greater autonomy to clergy of other rites in the East, a policy first declared by Ghengis Khan that the pope had thus far refused to honor.[55]

Whatever the official written and informal verbal contents of the message may have been, Louis IX was favorably impressed and interested in sending a reply to the Mongol prince. To this end he enlisted an experienced papal emissary, Andrew of Longjumeau, a Dominican, to lead a diplomatic mission both to Elijigidei and to Güyük Khan. Andrew may be the same person who carried the Crown of Thorns to Louis from Constantinople in 1238; in any case he knew both Arabic and Syriac. He was accompanied by two other Dominicans, William of Longjumeau, his brother, and John of Carcassonne, along with two priests and two soldiers. They set out from Nicosia on 27 January 1249.[56]

It was an impressive group, and Louis gave them diplomatic gifts to carry to the Mongols. These gifts consisted of "a tent arranged for use as a Chapel – a very costly gift indeed, for it was made throughout of fine scarlet cloth." The Old French then continues:

> Et li roys, pour veoir se il les pourroit attraire à nostre créance, fist entaillier en ladite chapelle, par ymaiges, l'Anonciacion Nostre-Dame et touz les autres poins de la foy.[57]

This passage is rendered quite differently in the translations; first, the version by M. R. B. Shaw:

> Moreover in the hope of making our religion appear attractive to the Tartars, the king had ordered for this chapel a series of little figures carved in stone, representing the Annunciation of our Lady, and all other subjects relating to the Christian faith.[58]

Second, the version by R. Hague:

> To see if he could attract them to our faith, the King had pictures embroidered in the chapel of the Annunciation of Our Lady and all the other articles of faith.[59]

The Old French would seem to refer to sculpture, "entaillier," and this is certainly the interpretation favored by my colleague A. Weyl Carr,[60] but the notion of embroidery images cut out to be placed in or attached to the chapel also seems possible.[61] Certainly images in embroidery would have been much more practical for travel. The envoys were also given fragments of the True Cross for both Güyük and Elijigidei,[62] along with other more worldly presents.

The purposes of this mission were to explore diplomatic possibilities on one hand, but it was also one of evangelization, to explain the Christian religion to the Mongols and to teach them about basic Christian beliefs. The purpose of the specified gifts was to serve these religious goals. The mention of these diplomatic gifts raises the question of how and where they had been acquired by the king. In the short time between the arrival of the envoys on 20 December and their departure on 27 January, these works were ordered and produced. There is no doubt that the relics would have most likely been in the possession of the king, and it would not be difficult to find fine scarlet cloth on Cyprus. But the images, whether sculpture or embroidery, would seem to have been done rapidly, and one wonders which artists were available in Nicosia to execute such a commission on short notice.

This embassy was not the only diplomatic mission to Louis IX on Cyprus. Joinville also reports that the empress of Constantinople, Mary of Brienne, wife of Baldwin II, arrived seeking aid for the Latin Empire. Louis IX and Marguerite received her at Limassol. Because her baggage had been left on her transport ship, which had broken anchor and been blown all the way to Acre, Mary was in need of clothing. Joinville supplied her with materials to make a new dress, including woolen cloth, satin, and ermine – materials apparently readily available on Cyprus. When Mary asked the king for assistance, Louis made it clear that his first priority was to fight the Muslims, but individual Crusader response to Mary's plea for support was generous. More than a hundred knights and nobles pledged to come to Constantinople, if possible, after Louis's Crusade was complete. Mary's husband, Baldwin II, would later visit the king in both Damietta and in Acre seeking assistance in his own words.[63]

During this fall and winter, Louis received other embassies. One came from king Hetoum of Armenia, bringing with it a lavish diplomatic gift in the form of a pavilion. This elaborate royal tent was said to be worth five hundred livres, and according to Hetoum had been given to him by the Turkish sultan of Iconium. Thus it is recorded that this diplomatic gift was recycled for later use. Also during this period Bohemond V of Antioch asked for and received military assistance against Turcoman raiders. In this way Louis IX could be seen to be active in attempting to promote peace in the Near East, just as he had attempted the same goal among his peers in the West during the time of, and indeed as part of his preparations for the Crusade.[64]

Besides the king, the papal legate, Eudes de Châteauroux, was also active during that winter. Eudes, the cardinal bishop of Tusculum, was a distinguished ecclesiastical figure. Formerly a professor of theology at the University of Paris, he became chancellor of the University in 1238. After being appointed the papal legate for the Crusade in France in 1245, he was in 1248 made apostolic legate for the entire Crusader East.[65] Having had wide experience in church administration in France before arriving in Cyprus, he proceeded to organize a council to reform the Latin Church on the island, and in March 1249 he issued a series of decrees to this end. Although Eudes was no doubt concerned with relations between Latin and Greek clergy to some extent, the fact was that he discovered there were fundamental problems with the Latin clergy that he had to address. Although some of the issues were routine, the kinds of things he had found in the West, other problems were basic and serious. The clergy needed schooling, theological and otherwise; some were even illiterate: "it is right for churchmen to be schooled in a scholastic discipline, so that . . . like chandeliers resplendent in the churches, they can show the life of truth. . . . " The clergy needed moral reform: "nothing shines more in the Lord's house than honest living in churchmen." Clerics were admonished to cease cohabitation with concubines! His decrees also addressed discipline, poor fiscal administration, the need for rural parishes and churches, absenteeism, and the conduct of church services. Clearly the Latin Church in the Near East needed better organization and leadership at all levels. Eudes, no doubt disgusted by what he found, would try to provide that leadership here, and later, when he arrived in the Latin Kingdom.[66]

The claim has been made that it was during this sojourn in Cyprus that Louis became involved with the sponsorship of the Cathedral Church of Haghia Sophia in Nicosia. Camille Enlart, in a famous and important study of Gothic art and architecture on Cyprus, proposed that in 1248 some of the king's masons worked on parts of Haghia Sophia, what Enlart identified as a third phase in the complicated history of this important building.[67] In fact, there is virtually nothing of the then-current Rayonnant Gothic style in the Church of Haghia Sophia, and recent opinion has asserted that "there are no signs of influence from masons attached to the court of Louis IX." Indeed, "it is reasonable to infer that, although Louis IX may have showered Cypriot churches with gifts, he did no building."[68]

Other time was certainly spent by the king and his men discussing strategy for the upcoming expedition. The master of the Knights Templars, the lieutenant master of the Hospitallers, and some Latin Syrian knights visited the army to discuss operational objectives.[69] Together they decided to attack Egypt. The Crusaders remembered that Damietta had been taken during the Fifth Crusade, and they thought they could enlarge on that victory. Unfortunately the Muslims were well-acquainted with Crusader strategy, and the sultan Ayyub moved troops into position to defend the Nile south of Damietta.

The Crusaders also arranged for their ships and supplies. When spring arrived and it was time to engage the ships, the Venetians were unavailable. The Genoese, on whom Louis IX was mainly counting, were in open conflict with the Pisans along the Syrian coast, but eventually, with the help of a truce between the warring parties, arranged by the *bailli*, John of Arsuf, the fleet could be put together. In mid-May 1249, operations began and the fleet began to assemble at Limassol. Joinville commented that "it was indeed a lovely sight to look at, for it seemed as if all the sea, as far as the eye could reach, was covered with the canvas of the ships' sails."[70] Alas, before the fleet could depart a violent storm blew up and scattered the ships. Louis IX finally sailed on 30 May.[71]

The delay in Cyprus produced negative and positive results. Over the winter of 1248–9 a number of Crusaders had died of sickness, including John of Montfort,[72] and a prime opportunity to attack Egypt while Sultan Ayyub had most of his army at Homs in Syria was lost. On the other hand, the longer the king waited, the stronger his army eventually became. Not only were there late arrivals from the West, but also other soldiers from the Near East – both from Syria and Frankish Greece – and more Templars and Hospitallers joined the Crusade army, in effect replacing those who died. By mid-May the army was fully assembled and when it was ready to sail, it was estimated to be about fifteen thousand men. The decision having been made to attack Damietta, the fleet finally sailed piecemeal at the end of May after a serious storm scattered the ships, and they anchored at the mouth of the east branch of the Nile on 4 June 1249.[73]

The Crusade of Louis IX – Damietta and Mansourah: 1249–1250

Upon arrival, as Joinville described it, the Crusaders "found the full array of the sultan's forces drawn up along the shore. It was a sight to enchant the eye, for the sultan's arms were all of gold, and where the sun caught them they shone resplendent. The din this army made with its kettledrums and Saracen horns was terrifying to hear."[74] In fact, the Muslim force was only a detachment, albeit a strong detachment, of the main army, which was camped to the south of Damietta with the sultan himself. Sizing up the situation shrewdly, Louis IX boldly decided on an immediate attack, a decision that, as Strayer characterized it, produced "the one completely successful operation of the crusade."[75] Landing on the west side of the mouth of the river, the Crusaders were able to get a large number of their men ashore at once with the use of small boats, and their commanders were able to keep the men together to withstand infantry and cavalry attacks. When Louis saw that the standard of St. Denis – his royal standard, the Oriflamme – was planted on the beach, he waded ashore in full armor to join his men. By the end of the day of 5 June, they had successfully established a beachhead.

After disembarking the king is reported to have sent a letter to sultan Ayyub which included the following words:

> You will be aware that I am the head of the Christian community, as I acknowledge that you are the head of the Mohammedan community. . . . I have given you sufficient demonstration (of our strength), and the best advice I can offer. Even if you were to promise me anything on oath and to appear before the priests and monks and carry a candle before me as an act of obedience to the Cross, it would not deter me from attacking you and fighting you on the land that is dearest to you. If this country falls into my hands, it will be mine as a gift. If you keep it by victory over me, you may do as you will

> with me. I have told you about the armies obedient to me, filling the mountains and the plains, numerous as the stones of the earth and poised against you like the sword of Destiny. I put you on your guard against them.[76]

Sultan Ayyub from his sickbed replied in his own letter:

> Your letter has reached us in which you threaten us with the size of your armies and the number of your warriors. Now we are a war-like race; never is one of our champions cut down without being replaced; never has an enemy attacked us without being destroyed. Fool! If your eyes had seen the points of our swords and the enormity of our devastations, the forts and shores that we have taken (from you) and the lands that we have sacked in the past and the present, you would gnaw your fingers in repentance! The outcome of the events you are precipitating is inevitable: the day will dawn to our advantage and end in your destruction.... We have recourse to God's word, for he declares most truthfully: "How many times has a small band defeated a large army, with God's support! For God is with the patient," [Koran, Sura II, 250] and to the words of the wise, according to whom: "The man of might is brought down in the end"; so your might will finally be brought down, and will bring catastrophe upon you. Greetings.[77]

Although the initial diplomatic exchanges indulged in saber-rattling and promised a fight to the finish, the first military encounter belonged to the Crusaders. Then, when the Muslim troops fled the beach, they crossed over to the east bank of the river and, surprisingly, marched back directly to the sultan's camp, leaving the city of Damietta to be defended only by local tribesmen. The citizens and the local soldiers, seeing that the sultan's men were retreating, then also abandoned the city. When the Crusaders discovered the city was empty and open, they occupied it without delay on 6 June 1249. Joinville exclaimed,

> Now let us declare that God Almighty was very gracious to us when he preserved us from death and danger at the time of our disembarkation.... Our Lord also showed us great grace in delivering Damietta into our hands, for otherwise we could only have taken it by reducing the enemy to starvation. This we can regard as certain, for it was in that very way that King Jean (of Jerusalem) had taken this city a little more than a generation before.[78]

Ibn Wasil's description of this debacle from the Muslim point of view is naturally very different. "On the morning of Sunday, 23 safar, the Franks appeared before Damietta and found it deserted, with the gates wide open. They occupied it without striking a blow and seized all the munitions, arms, provisions, food and equipment that they found there. It was a disaster without precedent.... There was great grief and amazement, and despair fell upon the whole of Egypt, the more so because the Sultan was ill, too weak to move, and without the strength to control his army, which was trying to impose its will on him instead."[79]

Ibn Wasil's assessment was, of course, negative:

> The behaviour of the people, of Fakhr ad-Din and of the troops was shameful: if Fakhr ad-Din had prevented their flight and stood firm, Damietta would have been able to defend itself, for when the Franks attacked it the first time, in the reign of al-Malik al-Kamil [1219], it was even worse provisioned and armed, yet the enemy failed to take it for a whole year.[80]

Ibn Wasil is, however, putting too much blame on the Kinanites tribesmen and the citizens, and deflecting criticism from the army and especially the elderly vizier Fakhr ad-Din, who commanded the army detachment for the ill sultan. Ibn Wasil even credited Fakhr ad-Din with cutting the bridge crossing from the west bank of the Nile, where the Crusaders were camped, to the east bank where the city of Damietta was located. Joinville, however, has a different story. He observes soberly, "The Turks had acted very unwisely in leaving Damietta without cutting down the bridge of boats, for had they done so it would have greatly hindered us."[81] The Crusaders, having taken the city of Damietta so precipitously, now failed to follow up this success by launching an immediate attack on the dispirited Muslim army upstream.

On 23 June, seventeen days after the Crusaders entered the city, Jean Sarrasin writes the following in his letter to Nicholas Arrode in Paris. Stating that Louis IX made his formal entry into Damietta on 12 June, he says:

> the king entered Damietta at prime in a great procession and with great humility. He had the town's chief mosque, indeed all the mosques, destroyed and used to build churches dedicated in honour of Our Lord Jesus Christ. We felt sure we would not leave Damietta until the feast of All Saints because of the rise of the river of Paradise which runs there and is called the Nile. No one can go to Alexandria or Babylon or to the Cairo when it has flooded across the land of Egypt. The floods, it was said, were not due to recede until then.

Then at the end of the letter there is this straightforward statement:

> Thirty years ago the Christians took the city from the Saracens with great toil and labour, and lost it again the same year when they moved to go and lay siege to the Cairo, and the river rose and flooded all around them so that we could go neither forward nor back. For this reason we think the army should not move until the river has dropped and returned to its bed.[82]

Interestingly, Louis IX's own letter, written in Acre in August of 1250, makes no comment on why the Crusade waited to march on Cairo after taking Damietta. There seems to be no doubt, however, that the disaster visited on the Crusader army that had been trapped in the Nile during flood season of 1221 was very much on everyone's mind, a scenario that Louis and his army clearly wished to avoid in 1249.

If the argument from the king's letter *ex silencio*, and the indications from other sources suggest that there was no serious discussion of an immediate march on Cairo and that the king resolutely chose to wait until after the flood, the fact is that Louis was also determined to wait for the arrival of his brother, Alphonse of Poitiers, with more troops.[83] Of course, there were other things that had to be taken care of as well. The queen, Marguerite, the countess of Artois, the countess of Poitiers, and other notables were installed in houses in the city, while the king and his army encamped outside its walls.[84] Taking possession of the spoils and their distribution proved to be a somewhat contentious issue, as usual, but with the best interests of the Crusade in mind, the king decided to handle the food supplies his way, with centralized control, not the traditional Crusader way.[85] In effect, Damietta now became the new Crusader supply depot where materiel from

Aigues-Mortes, Cyprus, and their new conquest was stockpiled. The king also had to organize the defense of the army and the city to protect against continuous Muslim raids. Clearly Louis was thinking for the long term, proceeding deliberately, carefully, decisively. Ecclesiastically, Damietta was now established as the seat of a Latin archbishopric. The main mosque of the city was converted to become the cathedral. It was dedicated to Notre Dame by the legate, Eudes de Châteauroux, and the king eventually personally endowed it at the beginning of November.[86]

After some months had passed since the Crusaders took the city in June, Alphonse of Poitiers still had not arrived and there was genuine concern for him and his men. The legate proclaimed public prayers for his safe arrival, with processions on three successive Saturdays in October. After two of these processions, Alphonse and his men finally appeared, on 24 October, arriving providentially after a major storm along the coast. Now plans for the Crusader advance into Egypt could move ahead. A council was held to determine strategy. Although a majority of the leaders advocated an attack on Alexandria, to blockade Cairo and force the sultan to terms, Robert of Artois passionately argued that the army must attack Cairo directly. "It was the chief city in the kingdom of Egypt, and if you wished to kill the serpent, you must first crush its head."[87] Weighing these options, Louis IX decided to march on Cairo directly.

On 20 November the Crusader army set out on the right bank of the Nile flanked by its fleet in the river. The queen and the patriarch of Jerusalem remained in Damietta with a strong garrison. The Nile waters were down, the Crusaders were well-organized, and three days later, 23 November, the sultan Ayyub, who had been in such poor health, died. His widow, the famous and valiant Shajar ad-Durr, quickly moved to control the situation, shrewdly concealing his death and organizing power among his son, Turanshah, currently in Syria; his vizier, Fakhr ad-Din, still commander of the Muslim army; and herself, but when news of Ayyub's demise finally did leak out, the Crusaders were heartened, and saw victory over this sultana and her aged general in their grasp.[88] Unfortunately, other obstacles stood in the way of their success.

Although Louis had avoided the perils of the Nile Delta during the flood season, he still did not have an adequate understanding of the complex geography of the canals and waterways branching off along the winding and powerful river. The Crusader advance was painfully slow, the result of the necessity of crossing numerous streams and larger branches while bringing the fleet up the river in an orderly progression. Joinville commented on the process of damming one of these little streams while under attack from Muslim cavalry.[89] The Rothelin Continuation described the advance:

> They travelled upriver slowly and by very short stages each day, because they were moving into the teeth of a fierce wind, and the ships and other vessels could not be brought on without immense labor, but they could not leave them. The king and the others on land travelled safely, but from Damietta to Mansourah, not more than eighteen leagues, it took them over thirty-one days. They left Damietta on 20 November and reached their goal on the day of St Thomas the Apostle, the fifth day before Christmas.[90]

Because the distance from Damietta to Mansourah along the right bank is approximately thirty-eight miles, this means the army was making only a little over a mile a day on average. The winding course of the Nile in this region is today nearly the same as it was in the thirteenth century, but the minor canal system is probably completely changed, so it is difficult to estimate how many subsidiary waterways the army had to cross.[91] In any case they made their way to the first major branch of the Nile, the Bahr as-Saghir, that branched off to the east toward Tannis, flowing into Lake Manzala. Camping there, they were on a triangular point of land across from the main Muslim army bivouacked just east of the town of al-Mansourah. Here the news of the sultan's death was confirmed and the Crusaders remained confident.[92] (Map 5)

At that point the Crusaders made a serious attempt to build a causeway over the Bahr as-Saghir. For over a month they worked unsuccessfully under constant attack. The Rothelin Continuation cited three reasons why the causeway could not be completed: "when the river was made narrow like that, the current ran so fiercely through the gap that no material could be held in place, but was swept downstream," "the Saracens flung so many huge heavy stones against our engines that they shattered most of them," and "the Saracens shot innumerable darts, arrows, and crossbow bolts alight and blazing with Greek fire."[93]

Joinville gives a vivid description of the latter: "This is what Greek fire was like: it came straight at you, as big as a vinegar barrel, with a tail of fire behind it as long as a long spear. It made such a noise as it came that it seemed like the thunder of heaven; it looked like a dragon flying through the air. It gave so intense a light that in the camp you could see as clearly as by daylight in the great mass of flame which illuminated everything."[94]

So harrassed from the rear by Muslim cavalry and bombarded by projectiles, some containing Greek fire, the situation worsened. Help only arrived in the form of a "Saracen deserter,"[95] who was willing to show the Crusaders the location of a ford across the Bahr as-Saghir downstream, to the east. Seizing this opportunity, Louis carefully planned a surprise attack on the Saracen camp.

Very early on the morning of 8 February, Shrove Tuesday, 1250, Louis and his three brothers led a large force to the ford, leaving the duke of Burgundy with others to guard their camp. The Crusaders were able to cross successfully, but because of the difficult terrain at the ford, progress was slow at first. The vanguard had not completely formed ranks when Robert of Artois attacked the Muslim camp. The Egyptian commander, Fakhr ad-Din, was killed before he could put on his armor; no one was spared. "It was sad indeed to see so many dead bodies and so much blood spilt, except that they were enemies of the Christian faith."[96]

At this point in the attack, blame for what happened next is assigned differently by the sources. The Rothelin Continuation reports that Robert d'Artois, seeing the Muslims running in defeat toward Mansourah, would not delay, and he attacked with his men and the Templars after them.[97] Joinville says the Templars were angry that Robert d'Artois had attacked the camp before they were able to cross the ford and form the vanguard; now they thought they would be shamed if they let Robert get in front of them again, so they rushed after the Muslims into the town of Mansourah.[98] The *Annales de Terre Sainte* says both Robert d'Artois and the Templars fought the

Muslims in Mansourah.[99] Louis's letter only says that after the camp was overrun, "our men then scattered; some of them crossed the Saracen camp and reached a town called Massoria [Mansourah], cutting down any of the enemy they met on the way."[100] Whoever was to blame, it is clear that Louis IX had issued orders to stay in rank, to wait for the main army to assemble, and not to ride off on individual actions. Indeed, the Rothelin Continuation reports that ten knights admonished Robert d'Artois in the king's name to wait until the army could join the vanguard before he followed the fleeing Muslims, but he would not.[101]

The result of this lack of discipline would eventually prove to be disastrous, but it did not diminish the king's vigorous efforts to maintain good order in his army. The vanguard rode into Mansourah chasing the fleeing Muslims. When they tried to turn back, other Muslims in the town threw posts and beams, "trez et merrien," down on them with deadly results. Robert of Artois, Ralph of Coucy, Roger of Rosoi, John of Cherisy, Erard of Brienne, William Longsword, and nearly three hundred Templars all died. Even Joinville, who tried to ride to their aid, was nearly killed. When the king arrived at the former Saracen camp with rest of his army, he made a memorable impression on Joinville. "Never have I seen so fine a man in arms; he towered head and shoulders over his people, a gilded helmet on his head, and in his hand a sword of German steel."[102] As soon as the Muslims saw the Crusaders, they counterattacked with "a tremendous noise of horns, bugles and drums . . . , men shouted, horses neighed, it was horrible to see or hear."[103]

In the ensuing battle, the Crusaders suffered heavy losses, but Louis ably commanded his men with strict discipline and they held their ground against fierce attack. In the end they succeeded thanks to infantry reinforcements, men with crossbows, who succeeded in throwing up a makeshift wooden bridge across the Bahr as-Saghir. At the end of the long day, the Crusaders occupied the place where the Muslims had been camped the night before. The Muslims retired to the town of Mansourah to the west. Jean de Ronnay, Lieutenant Master of the Hospitallers, brought Louis the news of his brother's death. He tried to comfort the king by recounting the deeds of their victory. "The King answered that God should be worshipped for all His gifts to him, and then great tears fell from his eyes."[104] The Crusaders had won a Pyrrhic victory. The Muslims also claimed victory. Ibn Wasil reports: "The victory over the Franks caused great joy and exultation. This was the first battle in which the Turkish lions defeated the infidel dogs."[105]

The Crusaders camped in this place near Mansourah and built defenses, a wooden stockade around their encampment made of material captured from the Muslims. The king immediately ordered that the makeshift wooden bridge across the Bahr as-Saghir be solidified, and a pontoon bridge was also constructed, so supplies and soldiers could be brought into the new camp as needed. During the entire time of Lent, 1250, they held their ground against heavy assaults. Louis's disciplined leadership enabled the Crusaders to fight off attack after attack. But the sustained fighting was taking its toll in manpower, and still the king was unwilling to consider a strategic retreat.

It was only after a particularly strong assault at the end of Holy Week, Maundy Thursday to Easter, 24–27 March 1250, that Louis finally began to realize that due to a series of new factors,[106] he and his troops were in serious danger. The Muslims were now led by the new sultan, Turanshah, only son of Ayyub, who had arrived from Syria to take command at the end of February. The upheaval among the Muslims over the transfer of power from Ayyub to Turanshah that the Crusaders had hoped for had not occurred, not yet at least. Crusader ranks had been thinned by attrition in battle caused by the heavy fighting. Crusader supply lines had now been cut by the appearance of a Muslim naval blockade downstream on the Nile, between Mansourah and Damietta. Convoys of food from Damietta were not able to fight their way past this blockade, and worse, the Muslims captured most of these ships and their supplies. Finally, conditions in the Crusader camp had deteriorated because of famine, followed by dysentery and disease.[107] Morale in the army was at a low point. "Men said openly that all was lost."[108]

At this inauspicious moment, sometime at the end of March or the first days of April, Louis apparently attempted to open negotiations with the sultan for a truce, along lines that had been discussed during the Fifth Crusade: an exchange of Damietta for Jerusalem.[109] But the sultan knew how desperate the Crusader situation was, and the Crusaders would not consent for the king to be surrendered as a guarantee for the return of Damietta. The sultan accordingly refused this offer. The Crusaders prepared to attempt a retreat to Damietta.

Before dawn on 5 April, the Crusaders withdrew across the Bahr as-Saghir with some difficulty[110] and began their retreat toward Damietta with ships full of wounded and those who were able, marching or riding along on the bank of the Nile. Despite the urging of his men, Louis refused to abandon the army and go to Damietta on his own, so he rode with the rearguard. Unfortunately the Crusaders neglected to cut their bridges over the Bahr as-Saghir, so as soon as the Muslims discovered their departure, they rode after the king and his army. Repeatedly the Crusaders were forced to fight off the attacks of the Muslims as they made their painful way along the river. Joinville describes how the king had been sick with dysentery in camp and now he could scarcely ride his horse.[111] In these circumstances, and indeed throughout the entire campaign, as Runciman says, "the King's own gallantry was beyond all praise." He was so ill, however, that the commander of his bodyguard, Geoffrey of Sergines, eventually had to take him to a cottage in the nearest village, which was near the town of Sharimshah. The army moved on.

The Crusader retreat moved swiftly, much faster than their advance in the previous November and December. They covered over half the distance to Damietta in just a few days. Nonetheless, the army was finally surrounded between Sharimshah and Fariskur, and the Bahri Mamluks were especially ferocious in battle.[112] Ibn Wasil called them "Islam's Templars" for their courage and audacity in this action.[113] Meanwhile the remnants of the fleet were captured, except for the ships carrying the papal legate, the patriarch of Jerusalem, and some other clerics.[114] The king was captured, along with his two brothers and several other nobles. Joinville had made it into one of the ships, but he was captured as well. After throwing his jewel box and jewels, and his relics with them, into the water, he was taken but saved from harm by being called "the kings's cousin." Then Joinville tells this interesting story:

> The chief emir in command of the galleys sent for me and asked me if I were the King's cousin. I answered that I was not, and told him how and why the sailor had said that I was. He told me that I had been wise, for otherwise we should all have been killed. Then he asked me whether I was any relation to the Emperor Frederick of Germany, who was then still alive. I answered that I thought my Lady my mother was his cousin, and he said that he liked me the better for it.[115]

The Crusader army was demolished or captured; all was lost.[116] The Rothelin Continuation comments:

> Thus by land and water and in various ways were lost all the Christians had assembled there against the enemies of our faith. And the unbelievers took their tents and pavilions, their horses, weapons and armor, clothes, chalices, books, gold and silver and all their other possessions, including even the king's seal.[117]
>
> Once he was captured, the "king of France and the great Frankish princes . . . were all taken to Mansura, where chains were put on the feet of the King of France and his companions. They were imprisoned in the house where the secretary Fakhr ad-Din ibn Luqman was living."[118]

Joinville was also brought back upriver to this place sometime later.[119]

It is concerning the time Louis was in prison in Mansourah having lost everything that a later story arose that appeared in works of art at the start of the fourteenth century – that is, shortly after Louis's canonization in 1297. The event is depicted in the Hours of Jeanne d'Evreux (*c.*1325–8), fol. 146v, as part of the cycle of scenes for the Hours of St. Louis: A dove – the Dove of the Holy Spirit – brings the king his prayerbook in prison. It is the book identified as his breviary, which he had lost at the time of his capture and which is depicted here as bound in what appears to be a beautiful green material.[120] This miraculous event, sometimes also described with an angel bringing the book,[121] appears in both manuscript illumination and fresco painting. The opinion has been advanced that the scene in the Hours of Jeanne d'Evreux may have been based on an earlier fresco from the Convent of the Cordelières de Lourcine, founded by the widow of Louis IX.[122] This story further dramatizes the fact that the Crusader army, and the king himself, lost virtually everything except the clothes they were wearing when they were captured by the Egyptians in April 1250. The words that sultan Ayyub had written in his letter to Louis IX in June 1249 had now come to pass.[123]

At this point two momentous events took place within days of each other that would have the greatest importance for the future of the Crusaders in the Holy Land. First, Louis IX proceeded to negotiate a truce with the sultan; second, the sultan would die at the hands of his own army, putting the king's agreement and the surviving Crusaders in peril.

The sultan is reported to have made heavy demands on Louis IX in prison, and he was even threatened with torture. For several long weeks in April while imprisoned, Louis was serene and steadfast in his faith, clearheaded and shrewdly intelligent through it all despite his weakened condition. He made it clear that as he was not king of Jerusalem, and because Conrad, the son of Frederick II, was, he, Louis, could not discuss concessions in the Latin Kingdom. Furthermore, because Damietta was still in the hands of the Crusaders, which was garrisoned with the remaining part of their army, Muslim demands would have to weigh him as prisoner against Crusader possession of the city as part of any truce they made.

> After many words and much discussion a truce was arranged between the king and the sultan in the following terms:
>
> The sultan would set free all Christian captives who had been taken since the day the king arrived in Egypt, both in his own land and in the lands of those obedient to him, and all others who had been taken since the day the truce was made between al-Kamil, his grandfather, and Frederick, emperor of Rome,. . . .
>
> The Christians would retain in peace, freely and without any impediments, all the lands they held in the kingdom of Jerusalem on the day the king landed in Egypt, that is to say, cities and castles, towns, villages and fortresses with all their dependencies; also all the possessions the king and the Christians then owned in the city of Damietta would be held in perfect safety under the sultan's guard. . . .
>
> All Christians who remained in Damietta either because of illness, to sell their goods or to wait for ships, would stay safely in the city and could go away in safety and take all their property with them, by land or sea.

The sultan must ensure that all these conditions were fulfilled. . . .

> The king was bound to surrender and make over to the sultan the city of Damietta and eight times one hundred thousand Saracen bezants for his own release. . . .
>
> Also the king was obliged to set free all the Saracens in captivity who had been taken in the kingdom of Jerusalem after the truce was made and guaranteed between al-Kamil, the sultan's grandfather, and Frederick, emperor of Rome, was well as all those taken in Egypt from the time the king landed in the port of Damietta.[124]

Both the king and the sultan agreed to these terms for a ten-year truce.[125]

At this point, the sultan Turanshah apparently sent the captured mantle of the king of France, scarlet red and trimmed with ermine, to his commander in Damascus, the emir Jamal al-Din ibn Yaghmur, with a letter describing the victory.

> Praise is due to God, who has lifted our sorrow from us! Victory comes from God alone. . . .
>
> On Monday, the first day of this blessed year, God poured out his blessing on Islam's behalf. . . . On the Tuesday night the enemy abandoned their tents, their possessions and their baggage and fled to Damietta, pursued all night by our swords, beyond shame, crying out in anguish. When Wednesday morning dawned we had killed 30,000, apart from those who cast themselves into the waves. As for the prisoners, it is impossible to count them. The Franks took refuge in Al-Munya and begged for their lives, and this was granted them. We made them our prisoners, treated them honourably, and recovered Damietta with God's help and assistance.[126]

While these arrangements were going forward, Louis's wife, Marguerite, gave birth to their son, John Tristan, in Damietta.[127] Joinville tells the story, which he no doubt heard in detail later on.

> On the very day he was born she was told that the Pisans and the Genoese and those of other free cities had decided to leave the town. The next day she summoned them all to her bedroom, which they filled completely, and said to them,

> "For the love of God, sirs, do not abandon this town. You can see that if it were lost my Lord the King would be lost, too, and all the prisoners. If this does not move you, take pity on the weak little creature who lies here, and wait till I can rise from my bed."
>
> "Lady," they answered, "how can we do so? In this town we are dying of hunger." She told them that the famine was no reason for their leaving. "For I shall buy all the provisions in the town, and from now on I engage you all at the King's charges." They consulted among themselves and came back to her and agreed to stay.[128]

If the king had ever doubted the character, determination, or judgment of his wife or her devotion to him,[129] her impressive courage and heroic labors on his behalf during this incredibly difficult time in their lives must have won his admiration for her when he eventually learned what had happened.

Shortly thereafter, Turanshah was assassinated in the new camp he had recently set up just south of Damietta. The Egyptian army in effect revolted against the sultan who many of them reputedly held in contempt. The leader of this coup and the man who struck the first blow was the Bahri Mamluk who would eventually become the next great Muslim leader, Rukn ad-Din Baybars al-Bunduqdari. The assassination took place on May 2, even in the sight of the Crusader prisoners, just after the arrangements had been made between sultan Turanshah and King Louis.[130] Even in the face of this latest development, Louis maintained his calm. Nothing the Muslims could do would disturb his faith. As Joinville says,

> they said that the King was the most steadfast Christian you could find. They gave as an example of this that when he came out of his lodging he used to lie on the ground in the form of a cross and so made the sign of the cross with his whole body.[131]

Despite some dissent the emirs in the Muslim army decided to agree to the truce arranged by Turanshah in principle at least. The Rothelin Continuation reports that "all the emirs in the Saracen host, that is to say 122, swore on the law of Muhammad that they would keep steadfast faith with the king and Christendom and abide by the truce and all the conditions we have already described. The king and his nobles in their turn promised just the same to them as they had done to the sultan. Under this second truce a specific day was named for the surrender of Damietta to the emirs and for all captives on both sides to be set free."[132]

Joinville and the Rothelin Continuation describe in some detail the problems and difficulties that arose during those tense final days when Damietta was turned over to the Muslims, and the king was released with his men on 6 May 1250. Repeatedly the Muslims broke provisions of the truce. "By the terms of their oath the Saracens should have looked after the sick; they killed them all. The King's engines of war, also, which they should have kept for him, they broke to pieces; nor did they keep the salt meats, as, not being eaters of pork, they should have done. They made a pile of the engines, another of the salt meat, and another of the new corpses, and set fire to them. The blaze was so huge that it lasted all the Friday, Saturday and Sunday." This was the Friday, Saturday, and Sunday after Ascension Thursday, 1250. To say that even the king's life was briefly in danger at one point before he was finally released would not be an exaggeration.[133] Contrary to the truce, only four hundred Crusader prisoners were liberated at this time; the overwhelming number remained in Muslim prisons. By Sunday evening, the money, which Louis had sworn to pay the Mamluks, was in their hands, 400,000 bezants, what Joinville calls 200,000 livres tournois. This was half the money owed, but Louis had lived up to his side of the arrangement; now the king was determined that the remaining provisions of the truce that could be honored by the Muslims, would be honored. But for the present he was free and Louis could set sail for Acre.

"Our galley then got under way, but it was a good league before any of us spoke to the other."[134] Only when the last of the royal hostages was released, Alphonse, count of Poitiers, did everyone breathe freely. But it was not a pleasant voyage. Although they were now free, everyone on these ships no doubt went over the Crusader defeat in their mind, and thousands of prisoners had still not been liberated from Muslim prisons. The trip was stormy, and all on board were physically exhausted. Many, like Joinville, were sick for the entire six days they were at sea. No arrangements had been made for the king on shipboard. He was forced to sleep on bedding the sultan had provided him and wear the clothes he had been given in prison, clothes of "black satin, lined with ermine and grey squirrel, and with a profusion of buttons of solid gold."[135] This is how the king of France would have looked when the people of Acre got their first glimpse of him.

THE LATIN KINGDOM AND KING LOUIS IX IN RESIDENCE: 1250–1254

Introduction

When Louis IX arrived in Acre on 13 May 1250, the Latin Kingdom was theoretically ruled by a king, but Conrad, the Hohenstaufen heir to the throne, had never set foot in the Near East, and the acting regent, king Henry I of Cyprus, resided in Nicosia. In fact, the Latin Kingdom was an assemblage of lordships, including Beirut, Caesarea, Haifa, Jaffa, Sidon, Toron, and Tyre, with Acre under the jurisdiction of the regent, who was represented in his absence by a *bailli*, normally elected by the great lords. The Latin Kingdom was joined by the two independent Crusader states to the north, the County of Tripoli and the Principality of Antioch, divided by the Muslim territory of Latakia. At this moment, both were ruled by Bohemond V, count of Tripoli and prince of Antioch. Bohemond, married to Lucia de Segni, a distant relative of two popes, was on good terms with Rome, but had allowed the Greek Orthodox patriarch of Antioch to live in the city as a scheme to encourage uniate churches who would submit to papal authority. This experiment proceeded with Antioch essentially governed by its commune, whereas Bohemond preferred to live in Tripoli, yet another example of the seemingly ubiquitous absentee phenomenon at this time. Bohemond in Tripoli sought to distance himself from his neighbors and their problems in the Latin Kingdom to the south. The Latin Kingdom meanwhile was not particularly pleased with the deference shown to the Greek Orthodox in Antioch.[136]

The Kingdom of Jerusalem was, therefore, as Jean Richard has described it, "a political chess-board" on which Louis IX would have to operate.[137] At the time of his arrival in Acre, Louis had no political authority in any of the lordships of the

Latin East, but he was esteemed as being an outstanding and pious leader. The city of Acre on the other hand had a terrible reputation, loudly voiced by Jacques de Vitry, and later reiterated by the legate, Eudes de Châteauroux.[138] Louis would bring moral and political leadership to this city, which was seen as not only sinful but also, in the words of Jacques de Vitry, as "a monster or a beast with nine heads each one at odds with the other."[139] Louis also had certain important resources: He had a sizeable military force, and he had access to substantial financial assets. Furthermore, as he himself eventually clearly saw it, Louis realized that he had important responsibilities. As part of the treaty covering his release, the Muslims had agreed to liberate about twelve thousand Crusader prisoners still held in Egypt. Louis was determined to see that the sultana, the remarkable Shajar ad-Durr, and Aybeg, who was the new Mamluk commander of the Egyptian army and eventually the new sultan, complied with these terms they had ratified, but it was to take nearly two years of negotiations to accomplish.[140]

Louis IX in the Latin Kingdom of Jerusalem: May 1250–April 1254

When the ships on which King Louis IX and his men set sail approached St. Jean d'Acre,

> all in that city went to meet the king in a great procession. The clergy were solemnly vested and bore reliquaries and crosses, holy water, censers and other things appropriate to Holy Church. Knights, citizens, sergeants, ladies, girls and everyone else were all as splendidly dressed and adorned as they could manage. All the bells in the town were rung and had been ringing in the whole day long from the moment they were seen coming across the sea. They went right down to the harbour where he came ashore in order to meet him and do him honour. Then straight away they led him and those with him to the high church of the city. Many tears were shed in compassion and for joy that the king, his brothers and companions, had been saved from the great blow Christendom had suffered. Then they escorted the king to his residence and all the great men of Acre gave him very handsome gifts, rich and precious.[141]

When Louis IX disembarked safely in Acre on 13 May 1250, he could not fail to have been impressed at the warmth of his welcome, and his first major and difficult decision, after several weeks of recuperation from his ordeal in Egypt, was to decide how to proceed. It is clear that the king had been searching his soul over the situation from the time of his imprisonment in Egypt, trying to answer the question of how and why his Crusade had failed. The answer he was forced to face was that it had not succeeded partly because of his own personal failures as its leader. As he was gradually able to recognize this inescapable fact, he courageously sought to find the right thing to do under the circumstances. In June 1250, he was at a tremendously important turning point, one that was significant for himself personally and one that was to be momentous for the Latin Kingdom, for the Kingdom of France, and indeed for all of Christendom.

In the early part of June his personal decisions were being made. He devoted himself to intensive penance for what he had done that turned out badly, and for what he had failed to do. He was a changed person because of his experience on the Crusade. He had acquired a new spiritual depth and devotion won from his adversity.[142] He was more determined than ever to do the right thing, to bring aid to the Holy Land according to his Crusader vow. To the extent possible he wished to right what, because of him, had gone wrong.

Louis may not have intended to stay very long in the Holy Land at first, but he explored his second decision – what to do next – with great openess, candor, and generosity. Jean de Joinville reports that there was vigorous debate during the week of June 17 to June 24. The king revealed to his surviving brothers, Charles and Alphonse, and to Joinville himself, his trusted confidant, that the queen mother had sent an urgent message, imploring him to return to France for the good of his kingdom. Joinville also pointed out that resident Crusaders had told the king that if he were to go away now that he was there, the Holy Land would be lost, because no one would dare to stay where there were so few remaining. Various arguments were advanced: Some said that the king should go home, procure men and money, and return fully prepared to fight again; others said he should stay in the East for a year. Joinville himself argued that the king should draw on his own money – Louis had only spent Church funds so far, so Joinville claimed – and that way he could attract knights from overseas and from the Morea – Joinville specifically mentions Frankish Greece as a possible source of manpower! That way, he said, the king could hold the field for a year, and "he will be able to deliver those poor prisoners who have been taken captive in the service of God and of himself, and who will never be set free if he goes away."[143]

Louis weighed his options after these discussions, and then he reported his decisions, first to the Crusaders in Acre,

> My lords, . . . I sincerely thank all those who have advised me to return to France, as also those who have advised me to remain here. But I have come to the opinion that if I stay there will be no danger of losing my realm, since the Queen Mother has people enough to defend it. I have also considered that the barons resident in this country tell me that if I leave here the kingdom of Jerusalem will be lost, for no one will dare to remain after I have left. I have therefore decided that I will not on any account abandon the kingdom of Jerusalem, which I came here to re-conquer and defend. So I have finally determined to remain here for the present.[144]

As Strayer remarked, "the moral greatness of Louis never appeared more clearly than in this decision to remain overseas."[145]

Then the king wrote a long letter that he apparently delegated his two sons to take home with them, sealed with his new seal.[146] Louis was not happy about the situation, far from happy in fact. Matthew Paris described his piteous condition:

> The king himself remained sad and inglorious at Acre, and swore in the bitterness of his heart that he would never return to sweet France in such a state of disgrace; for who can, without sighs and tears of sorrow, describe his grief and lamentations when, his third brother Robert being dead, and himself defeated, he now trusted two others in an inglorious condition to the billows of the ocean.[147]

Nonetheless, he sent Alphonse and Charles, who in any case had refused to stay, back to France with his letter. In the text he described the events of the Crusade from the time of his capture of Damietta to the treaties and truces he had to enter into because of his capture and the ransom that had to be paid for his release and the release of the Crusader prisoners. Furthermore, he officially took responsibility for what happened, and proclaimed how he had decided to deal with the situation. He ended with a fervent plea for support. It is a remarkable document and worth quoting certain notable passages here:

> Louis by the grace of God King of the French, to his dear and faithful prelates, lords, knights, citizens, burgesses, and to all else who live in his Kingdom to whom these letters shall come, greeting.

After explaining the unfortunate events of the Crusade, and the fact that the terms of the treaty of surrender are not being kept, he straightforwardly states the following:

> After the truce and our own release, we were confident that the part of the Holy Land occupied by the Christians would be at peace until the truce expired, and had intended and planned to return to France. We were already preparing our passage when we realised from what we have been telling you that the emirs were openly violating the truce, and in spite of their oaths did not shrink from deluding us and Christendom. We accordingly summoned an assembly of the barons of France, of the Temple, of the Hospital of St. John, of the Teutonic Order of St. Mary, and the barons of the Kingdom of Jerusalem, and consulted with them as to what we should do.
>
> The majority thought that if we were obliged to return at this moment, we should be leaving the country exposed to complete loss; it was now unhappily reduced to a miserable state of weakness, and our departure would leave it open to the Saracens; we should also have to count as lost the Christian prisoners who were in the enemy's hands, and give up all hope of their release. On the other hand, if we stayed in Palestine there was hope that time might bring some improvements, the release of prisoners, the retaining of castles and fortresses in the Kingdom of Jerusalem, and other advantages for Christendom, especially since trouble has arisen between the Sultan of Aleppo and the rulers of Cairo. Already this sultan has collected his forces and seized Damascus and some castles belonging to Cairo. It is said that he is to invade Egypt in order to avenge the death of the Sultan whom the emirs killed, and make himself master, if he can, of the whole country.
>
> Although many dissuaded us from prolonging our stay overseas, these considerations, our pity for the miseries and sufferings of the Holy Land we had come to help, and our compassion for the hard lot of our prisoners in captivity, determined us to delay our return and stay some time longer in the Kingdom of Syria, rather than entirely to abandon the cause of Christ and leave our prisoners exposed to such dangers.

In these statements, Louis not only obviously explains the reasons[148] that compel him to stay, but he also shows that he is developing a program, a specific agenda of what he can do to help the Holy Land. So he concludes his letter with a strong plea for aid and support:

> We have, however, decided to send back to France our very dear brothers the Counts of Poitiers and Anjou, that they may comfort our very dear mother and the whole Kingdom. As all who bear the name of Christian would be full of zeal for the task we have undertaken, and you, men of the Church, in particular, who are descended from the blood of these whom Our Lord chose as a special people for the deliverance of the Holy Land which you should count your own by right of conquest, we summon you all to the service of Him who on the Cross served us, and shed His blood for your redemption, that your hearts may be in Christ Jesus.[149]

At this point Louis reaches a fervor and intensity in his message that seems comparable to what Urban II must have said at Clermont in 1095.

> For this vile people, not content with the blasphemies it vomited against the Creator in the presence of Christian men, beat the Cross with rods, spat on it and trod it under foot in hatred of the Christian faith. Come, then, knights of Christ, own soldiers of the Pope of the Living God, take up your arms and be strong to avenge these outrages and insults; imitate the example of your ancestors, who of all nations were distinguished by their devotion to the exaltation of the faith, and their loyal obedience to their worldly masters, and filled the world with the report of their high deeds. We have led the way for you in God's service. Do you follow us, and although you come later you will receive with us from the Lord the reward which the husbandman in the Gospel gave equally to those who came at the end of the day to work in his vineyard and to those who came at the beginning. Those who come, or send effective help to us or rather to the Holy Land, while we are still here, will earn, besides the indulgences promised to those who take the Cross, the respect and gratitude of God and of men. Hasten, then, and let those whom the power of the Most High shall inspire to come in person or send help, be ready to cross the sea in this coming April or May. As for those who cannot be ready for this first passage, let them at all events be ready for the St. John's day passage. The nature of the task calls for speed, and every delay will be fatal. Do you, prelates and other loyal servants of Christ, help us with the Most High by the fervour of your prayers. Order them to be said everywhere in your jurisdiction, that your prayers and those of other good men may obtain for us from the divine mercy the graces of which our own sins make us unworthy.
>
> Written at Acre, the year of Our Lord 1250, in the month of August.

Here we find that Louis was projecting a more substantial stay, at least well beyond the spring of 1251 and possibly longer. Mindful of the large number of soldiers who decided to return to France after the Crusade was over, he was by then calling for new reinforcements. He clearly saw the need for serious negotiations with the Mamluks over the issue of freeing the prisoners. Finally, he was plainly thinking of how he might help the Latin Kingdom militarily and reconquer Jerusalem and the territory lost in 1244.

Alphonse of Poitiers and Charles of Anjou sailed on 10 August for France with this letter and others of a more personal nature, no doubt sent by Louis to his mother and others.[150] Queen Marguerite and their new baby boy remained in Acre, along with a number of soldiers, at most something over a thousand men. Louis now was not only their leader, but he also had to meet all expenses for the Crusaders; no one had any money left. Once his French vassals had left for the West, Louis interacted continuously and directly with the local barons, ecclesiastical officials, and leaders of the military orders in pursuing policy. This enabled him to draw both on his and their experience of dealing with the Muslims. Fortunately, for the Latin Kingdom and for Louis, the assassination of Turanshah had generated a serious rift between the new Mamluk rulers in Cairo and the Muslims in Syria and Baghdad. Given that Louis was now recognized as the de facto ruler in the kingdom and the facts that Conrad had no intention of coming East and that Louis had the cooperation of the current *bailli* for King Henry of Cyprus and his regent, he now pressed on with negotiations for the release of the Crusader prisoners stipulated under the truce he had recently signed. Of course, he had his own part of the agreement to fulfill; payment of the other half of the ransom money. In the Latin Kingdom, Louis turned from the politics of war to the politics of diplomacy.

As Jean de Joinville points out, there were issues of honor and dishonor involved in Louis's decision to stay in the Latin Kingdom but there was a great deal of money involved as well. The total ransom that had been demanded for the king's liberation was set at 800,000 gold bezants, or 400,000 livres tournois. Half of that had been paid immediately to secure the king's release, and the other half was under negotiation while the king attempted to secure the liberation of Crusader soldiers still in Egyptian prisons. Eventually, another 208,750 livres tournois was allocated for this purpose. These are in fact huge amounts of money, which the king took full responsibility to deal with.[151] There would also be major expenditures for the soldiers that were serving under his charge – as one example, Joinville estimated that it would cost the king 3,000 livres tournois per year for himself, three other knights, and their retainers.[152] The Rothelin Continuation states forthrightly that the king "spent heavily in order... to send his envoys to the sultans and receive theirs,"[153] not to mention ambassadors sent to the Tartars, among others. How could these sums be raised? The king would once again have to face the reality of fundraising and financial planning as well as conducting a vigorous foreign policy. Clearly for the financial needs of his activities on behalf of the Latin Kingdom, he was counting on resources that could be raised in Europe and especially in France, in addition to church revenues. For his diplomatic activity, he opened serious discussions with both the Mamluk sultan and sultana in Cairo and the Ayyubid emir of Aleppo and Damascus. He also began his program intended to aid the Latin Kingdom internally.

In regard to the latter, one of his first initiatives must have been a campaign to strengthen the outer walls of the city of Acre, and especially to build the outer walls on the perimeter of Montmusard. If in fact this newer area of the city had been protected with a single wall by 1212 as the evidence seems to suggest,[154] the sources are unanimous in indicating that Louis IX sponsored a major expansion of the fortifications of Montmusard at this time. The Noailles Continuation says simply that the king strengthened the new part of the city.[155] No date is given, but this remark is associated in the text with the departure of the king's brothers for France on 10 August, so it is reasonable to suppose that construction began just as they were leaving – in other words, just about the time he wrote the long letter quoted earlier. Another explicit if much later source is Florio Boustrone, who states that Louis IX, "fortified [Acre] with walls and ditches... beginning from the Gate of St. Anthony [and continuing] towards the sea as far as St. Lazaro" in 1251.[156] This text is more explicit, and although again no particular date is given, the likelihood is that what construction Louis actually sponsored was finished in 1251, before the king left Acre to go to Caesarea during Lent. Other sources such as William of St. Pathus state that Louis IX strengthened a part of the city of Acre which is called Mont Musart and that he personally participated in the construction.[157] Apparently, however, not all of the walls along the outer perimeter of Montmusard were done when Louis decided to go home because the legate, Eudes de Châteauroux, was reported by Joinville to say that he intended to stay in Acre for a year after the king left. "I [Eudes] mean to spend all my money on fortifying the suburbs [le fors-bourc] of Acre, so that the Romans will see that I am not bringing back any money, and then they will not pester me to see what they can get from me."[158] It is likely the king also sponsored construction on the eastern walls of the old city, although the sources do not mention this in particular. The problems of exactly what construction was done, when it was done, and where these fortifications were located are still a matter of active discussion. I offer further comments on the controversy over the location of the walls later in the chapter "The Art of the Crusaders: 1244–1268."

It was fortunate that Louis had sorted out how he wanted to proceed by the end of July, because there were many problems to be dealt with both within and outside the Latin Kingdom, generating a high level of diplomatic activity. The Rothelin Continuation comments, "messengers came constantly from all parts to the king in Acre and every day brought him fresh information. The king was unfailingly pleasant, cheerful and resolute."[159] Louis now began a strategy of seeking out and organizing possible foreign allies while focusing on efforts to repatriate Crusaders incarcerated in Muslim prisons.

The first envoys to reach him came from the emperor, Frederick II, and the Ayyubid sultan of Aleppo, an-Nasir Yusuf, who had occupied Damascus in July 1250. Frederick purportedly was sending these envoys to sultan Turanshah to facilitate the release of the Crusaders, but finding that the sultan was now dead and Louis was already freed, the envoys returned to the West. An-Nasir Yusuf sought an independent accord with Louis against his bitter Mamluk rivals in Cairo; in return for an alliance, he even hinted that he might surrender Jerusalem to the king. In these favorable circumstances and in an effort to strengthen the Crusader army, Louis sent his royal armorer, John the Armenian, to Damascus to purchase horns and glue to make crossbows. Meanwhile Louis realized what a diplomatic advantage this Muslim split provided him in his negotiations with Cairo over the provisions of the truce and especially with regard to the remaining Crusader prisoners in Muslim jails. He withheld his decision on whether to enter an alliance with an-Nasir Yusuf until he determined how the Egyptians were going to honor the treaty they had made with him.

To pursue this issue, Louis sent John of Valenciennes to Egypt to exhort the Mamluk sultan to release the Christian prisoners. Up to this point the Mamluks had been rather careless in how they observed the terms of the truce. Now, in the face of the persistence of the king, they started paying more attention. John of Valenciennes was able to secure the liberation of some of the knights held in Muslim prisons. This included soldiers from the time of the Crusader defeat at La Forbie in 1244 as well as from the recent Crusade, along with the remains of Walter, lord of Reynal. The countess of Sidon, sister of lord Walter, had his bones interred in the Hospitaller compound in Acre. "She arranged that at the service every knight should give a candle and a silver penny at the offertory, and the King a candle and a golden besant, all at her own expense."[160] There must have been many such funeral services in these months, albeit perhaps not with such lavish arrangements, and many other important tombs established in the Hospitaller cemetery of St. Michael, in the cemetery of St. Nicholas, and in other cemeteries around Acre.

The Rothelin Continuation gives a list of the knights, soldiers, and others released, mentioning in particular the Master of the Hospital, William of Châteauneuf, who had been captured at La Forbie.[161] Louis IX responded in due course by sending his own envoys back to the Egyptians with rich gifts, and he released some three hundred Muslim slaves. The exchange of prisoners was clearly underway. The king even "paid out large sums" to buy Muslim slaves from their Christian owners so that he could send them back to Egypt and ensure the release of more Christian prisoners. Louis also increased the pressure on the Mamluks, however. He boldly proposed that he would make no further arrangements with the Egyptians unless they agreed to the following three remarkable conditions: first, that the heads of all Christians that had been hung around the walls of Cairo be given to him for Christian burial; second, that all Christian children who had been captured and converted to Islam be returned; and three, that the king be released from his obligation to pay the remainder of his ransom. The Mamluk reaction was tentative, probably because of the internal power struggle still in progress over the sultana, Shajar ad-Durr, behind the scenes. Eventually they decided to send an embassy with "about fourscore and ten enslaved Christian knights and 2200 men and women, as well as an elephant, a wild ass and rich and precious gifts."[162] But on the other matters there was no resolution as yet.

At this point it should be noted that the major sources clearly indicate vigorous diplomatic activity between Louis and the Muslims, both in Cairo and in Damascus. The fact is, however, that no one source contains a record of all the important aspects of the negotiations, nor are dates assigned clearly to the various embassies that are described in any detail. Thus we are forced to reconstruct as carefully as possible what was happening and when, between June 1250, the time that Louis arrived in Acre, and May 1252, when all the prisoners were finally released and a new truce was arranged between Louis and Aybeg, the Mamluk sultan. What seems clear in regard to the ongoing negotiations are the following factors. First, Louis IX was determined to free the prisoners. Second, the Mamluks in Cairo were somewhat disorganized in carrying out the terms of the original truce from the time of Louis's Crusade. This was caused partly by the power struggle going on there behind the scenes, and partly by the fact that several figures assumed major positions of power after May 1250, persons who had not been party to the original truce. Third, the dynamics of these diplomatic exchanges was a complex, interrelated, and ongoing process, in which what was going on between Cairo and Damascus was as important as what going on between the king and either one of the sultans.

In this world of Near Eastern diplomacy, therefore, besides being "cheerful, pleasant and resolute," Louis had to have a clear vision of the goals he wished to accomplish, had to be perspicacious and worldly-wise when receiving diplomatic envoys, and astute and clever when dealing with them. That he possessed all these qualities we see particularly in an encounter with an envoy who arrived from the "Old Man of the Mountain," as reported by Joinville. The Old Man of the Mountain was sheik al-Jabal, leader of a sect of Shiite Muslims, known as the Assassins, who controlled territory along the border of the Latin Kingdom and the County of Tripoli with a series of castles in the rugged country east of Margat and north of Crac des Chevaliers. Sheik al-Jabal shrewdly sought to use the king to rid himself of an onerous tribute he currently paid to the Hospitallers and the Templars. When the sheik's envoy boldly attempted to bluff the king into revoking the tribute, something over which Louis had no jurisdiction in any case, the king, clearly understanding the ploy, asked the envoy to return later in the day. Louis then cleverly invited the masters of the two orders to join him and received the envoy again. Finding his strategy exposed, the envoy was ordered by the two masters to return to them the next day. When the envoy arrived, the masters commented that it was audacious of the sheik to attempt such a "peremptory message to the King, and added that it was only out of respect to the King, . . . , that they did not have [the envoy] drowned in the filthy waters of the harbour at Acre, to their Lord's shame."[163] They admonished him to return within a fortnight bringing the king appropriate gifts so as to win his favor.

Within the fortnight an embassy of the sheik arrived in Acre with suitable symbolic gifts and special presents. "Among other jewels which he sent the King were an elephant finely made of crystal, and an animal, also of crystal, called a giraffe; crystal apples, too, of different sorts, and games of backgammon and chess. All these were scented with ambergris, the ambergris being fastened to the crystal by fine golden filigree. As soon as the envoys opened the boxes which held them, the scent was so sweet that the whole room seemed full of fragrance." In response, Louis sent the sheik "a great abundance of jewels, draperies of scarlet, golden cups and silver bridles. With them he sent Brother Yves le Breton, who knew [Arabic]."[164] Here in the months after Louis has taken up residence in Acre, we get a tiny glimpse of the diplomatic gifts that were being exchanged, as an indication of the artistic production that was possible in Acre and elsewhere for such activities. Joinville also points out how interested Yves le Breton was in the sheik's books, which is to some degree an extension of Joinville's – and Louis IX's – interest in books, as well as the material on the Christian faith that they might contain.[165]

While these diplomatic efforts were going on in the summer and fall of 1250, the king in Acre and the Mamluk sultan in Cairo were engaged in other activities. The king clearly had gotten his administrative machinery up and running, including his chancery, and we can imagine that he organized this with the cooperation of scribes working in Acre, who were employable both for their skills in writing and in illumination. It is during this period, when the king is establishing his residence, organizing his court and administrative functions, and starting to conduct diplomatic business while helping to fortify Acre and strengthen the Crusader army, that he would have actively sponsored local craftspeople and artists. As we have seen, in conducting diplomatic interchange, the king has had to commission diplomatic gifts. To arm the troops he has caused materials to be bought for military manufacture; no doubt he also had new armor produced for himself and for some of his men, and horses had to be acquired. In light of the fact that the supplies he had stockpiled in Damietta had mostly been destroyed or sent to Cairo, and none was recoverable, much of that materiel would have to be replaced. As noted earlier, he had begun a program of construction to strengthen the walls of Acre at this time. It must have been also during this period that he and others commissioned personal and ecclesiastical books in Acre, books such as Arsenal MS 5211, which I discuss in some detail later. Besides the things he acquired or commissioned in Acre, he had also no doubt ordered and started to receive further special items from Paris, royal and personal items, once it became clear that he would be staying in the Latin Kingdom for a time.

In Egypt, rather different developments were underway. Ibn al-Furat, writing long after 1250, describes what happened. Concerned about the fact that Damietta had fallen twice to the Crusaders and that it might even become a target for an-Nasir Yusuf, "they decided they should destroy its walls, raze it and blot out its traces. On Monday, twelve nights from the end of the noble month of Sha'ban in the year (6)48 (14 November 1250), the year with which we are dealing, masons, craftsmen and labourers were sent to Damietta. They destroyed it and built a city near it called al-Munshiya, which replaced it as a port and where they were secure from any Frankish attack because of its distance from the Mediterranean."[166] The destruction of Damietta was an important signal to both an-Nasir Yusuf, and his Ayyubid supporters, and to Louis IX that Aybeg was now firmly in control in Cairo at the head of the new Mamluk regime along with Shajar ad-Durr, after a period of transition in which there was dissension in the Muslim world over having a sultana, Shajar ad-Durr, who possessed so much power. Aybeg also wished to gain the diplomatic advantage in negotiations with the French king, so he promised to return the remaining Crusader prisoners and left open other possibilities for the future.

As the year was ending, far away in western Europe, Frederick II died on 13 December 1250, leaving his son, Conrad IV, as ruler in Germany. As we have seen, Frederick had had a major impact on the affairs of the Latin Kingdom, perhaps the most surprising of which was the arrangement of his ten-year truce with the Muslims, 1229–39. Unlike his father, Conrad IV had had no occasion to come East while Frederick was alive. Now that Frederick had died, Conrad would certainly not travel to the Holy Land; he had his hands full at home. This of course left Henry I of Cyprus still as the nominal Eastern regent, but because neither Conrad nor Henry would come to Acre to be recognized by the barons, the *bailli* administered the kingdom as before. Thus ironically, Louis IX, a king who had no official political position in the Holy Land, who had led the ill-fated Crusade into Egypt in 1249–50, continued to wear the mantle as de facto leader of the Latin Kingdom and the other Crusader States in Syria-Palestine.

1251: As the year 1251 opened, Louis IX was still in Acre, and now that it was clear he would be staying in the Holy Land for a more extended time, Queen Blanche, regent in France, successfully sought and obtained an additional tenth of revenue for two years to help finance his activities.[167] He also dealt with not only his financial arrangements, but also with certain monetary matters in the Latin Kingdom. The papal legate, Eudes de Châteauroux, was scandalized that the Latin Kingdom had been striking gold bezants that bore the name of Muhammed and the number of years from his birth. When he reported this to the pope, Innocent IV forbade the practice under pain of excommunication – his ban applied to both Acre and Tripoli. Even before the pope's decree arrived, the old *sarrazinas* gold coin used by the Franks for trade in the East was restruck in Acre with a new design. Having the same weight and alloy, with two-thirds gold content, these new Crusader bezants had a dramatically different design, no longer imitating the Muslim coins as before. There was a large equal-armed cross on the obverse and four smaller crosses at the beginnings of the inscriptions; two on the obverse, two on the reverse. The inscriptions, all still in Arabic, identified the coin as being "struck in Acre in the year... of the Incarnation of our Lord the Messiah. Father, Son, and Holy Ghost, one godhead." Then there was a message about the Christian religion: "We are glorified by the Cross of our Lord Jesus the Messiah, in whom is our salvation and our life and our resurrection, and in whom is our deliverance and pardon."[168] We can imagine that Eudes of Châteauroux may have composed this message himself! The earliest date found on these coins is 1251, and they are found struck until 1258, when they abruptly ceased.[169]

Louis himself continued his determined efforts to have the prisoners returned, but seeing that the Egyptians were certainly not keeping the truce, which they had made for the return of Damietta at the end of his Crusade, he now took a remarkable step. He sought to have his oath to keep this truce annulled. To this end he summoned the papal legate, the major ecclesiastical officials, and the high barons of the kingdom and submitted his request and the evidence that the Mamluks had "grievously and treacherously" broken their oaths with regard to this truce. After due discussion and consultation, the legate, with the consent of all present, "released the king from his oath to the emirs and declared that the king and Christendom were in no way bound to keep the truce with the Saracens... Thus the king and Christendom now had no truce with any Saracens."[170] Meanwhile he continued to negotiate with both sultans, the Ayyubid an-Nasir Yusuf and the Mamluk Aybeg, who were now at the point of open hostilities.

Just as an-Nasir Yusuf had conquered Damascus earlier, he intended to take Cairo as well and restore the Ayyubid dynasty in the tradition of his namesake, Saladin. From his new center of operations in Damascus during the late summer, 1250, he had sent a strong advance contingent of his troops to Gaza in preparation for an attack on Egypt. His plans came to nothing at first, when he became seriously ill and his soldiers were forced to retreat back to Damascus. By the start of December 1250, however, he had assembled an even larger army, which again marched to Gaza by the end of the month. In January he entered Egyptian territory. Finally, on 3 February 1251, the troops of an-Nasir Yusuf attacked the Egyptians near Kura', west of modern al-Zaqaziq, deep in the Nile Delta. The Syrian army won the initial battle, but an-Nasir Yusuf fled when Mamluks attacked him and some of his bodyguard deserted to the Egyptians in the midst of the action.[171] Even though his army lost relatively few men in this encounter and reassembled eventually back in Damascus, the result of this battle was that an-Nasir Yusuf lost the prestige of his previous string of victories, and his attempt to restore the Ayyubids in Cairo was effectively over. Even more significant was the fact that Louis IX could more clearly see how to apply pressure on the two warring sultans.

Once the construction at Acre was finished and the king was absolved of his vow, Louis took the opportunity to make a pilgrimage, the only pilgrimage to a major shrine he appears to have allowed himself to make during his time in the Holy Land. During the vigil of the Feast of the Annunciation, Louis left Acre for Sephoris, where he spent the night. The next day he passed Cana, visited Mount Tabor, and then approached Nazareth. As he reached the outskirts of the town, he dismounted and marched in on foot, wearing a hairshirt.[172] On 25 March, the Feast of the Annunciation, he attended Mass in the Church of the Annunciation, where the legate, Eudes de Châteauroux, celebrated the liturgy and delivered the sermon. Then Geoffrey de Beaulieu tells us that the king gave sumptuous gifts to the church.[173] What precisely these gifts may have been is not specifically known, just as this is not known from Louis's time on Cyprus. One wonders if he had had special manuscripts and/or metalwork produced in Acre to be given on this occasion. Unfortunately, because of the destruction of the church in 1263 by Baybars, essentially nothing is extant from the magnificent Crusader shrine of the Annunciation except the remarkable Nazareth capitals along with numerous fragments of figural sculpture commissioned in the 1170s and finished before Saladin captured the city in 1187.[174] Louis made the pilgrimage to Nazareth because it was under Crusader control but never attempted to visit Jerusalem or Bethlehem, not to mention other less exalted sites, which were still in Muslim hands.

It is interesting that following his account of the king's visit to the Nazareth holy site, Geoffrey of Beaulieu reports the following:

> While he was still overseas (in Palestine) the faithful king heard about a great Muslim sultan who diligently had enquiries made about all the kinds of books which would be needed by Islamic thinkers and had these works written out at his expense and stored in his library, so that the learned could have a copy of every book they required. The pious king... conceived the idea that on his return to France he should have copied at his expense all the books of holy writings which had been found to be useful and authentic in various monastic libraries, so that he, learned men and the religious in his household could study them to their profit and to the edification of their neighbours. On his return he carried out his plan and had built an appropriate and strong place in the treasury of his chapel (the Sainte-Chapelle) in Paris, where he industriously collected many original works, such as those written by Augustine, Ambrose, Jerome, Gregory and other orthodox teachers.... He preferred to have codices newly copied than to buy those which had already been written out, saying that in this way he could increase the number and usefulness of the holy books.[175]

This passage is important as Jonathan Riley-Smith points out.[176] First, it gives evidence that Louis IX conceived the idea of a great library at Sainte Chapelle while in the Holy Land. If indeed he first mentioned it after his pilgrimage to Nazareth, it suggests that books he had seen at the church of the Annunciation, or the lack thereof, may have given him the idea. Be that as it may, his interest in having books newly made corresponds directly to the stimulus he appears to have given to book production in Acre while he had been there. Finally, it is significant that Louis's interest in books and learning are first attributed to him while he was in the Near East on Crusade and can be linked to his time there in residence in the Latin Kingdom of Jerusalem. It may not be overstating the case to say that whereas before 1248 Blanche of Castile was the main patron of illustrated manuscripts at the royal court in Paris, after she dies in 1252 and after 1254 when Louis returns home, he became the great patron of books and libraries there in her stead.

Also following his visit to Nazareth, at the very end of March in the season of Lent, Louis left Acre and went to Caesarea to fortify the city. Meanwhile Joinville was now engaged for a second year. In Caesarea, Louis "had the town enclosed with ramparts, ditches and sixteen towers."[177] In fact, the work at Caesarea is one of the best examples of construction done for Louis IX that still survives – at least partially – in the Holy Land, in contrast to the work at Acre or later at Jaffa, both of which are now almost completely destroyed. To build a complete set of new walls and gatehouses, Louis and his men resided in Caesarea more or less continuously between March 1251 and May 1252.[178] Their only significant departure was apparently a brief visit to Haifa nearby, where according to certain sources the king repaired walls and towers where they were damaged there.[179] Pringle suggests that the tombstone of John of Le Puy, "sergant dou puissant Roy de France," found in the wall of a house in Haifa in 1976, may possibly also date from this period.[180]

Just as in Acre, many messengers and visitors came to Louis in Caesarea.[181] In particular it was while Louis was there that discussions leading toward a new truce continued with the Mamluks. In regard to his own family, Louis and Marguerite received a new addition with the birth of a son, whom they named Peter. Peter, who, according to Joinville, was born nearby in the security of Chastel Pelerin, was the second of their children to be born in the Levant and eventually became the count of Alençon. He arrived in 1251, but the exact date is not known.[182] We may imagine that Peter was baptized in the cathedral at Caesarea when he and his mother joined the king there after her confinement. The cathedral seems to have been completed well before the arrival of Louis IX, but he might have sponsored repairs and surely made gifts to this important church, which had had such venerable bishops even in Early Christian times.

Other than these two additional events, the foray to Haifa and the birth of the new son, the sources are remarkably silent on the activities of the king for the rest of 1251, while he and his men worked in Caesarea. A letter that Louis wrote to his son Alphonse in August[183] described how the Crusaders were well situated in Caesarea, little bothered by the Muslims who were fighting each other. He renewed his request for more support from the West so he could continue to aid the Holy Land. Life in Caesarea must have been agreeable, situated on a splendid stretch of beach and away from the constant press of people and contentious politics in the big city of Acre. We can imagine the king reading his personal Bible and prayer books as part of his daily regimen of prayer, along with financial, political, diplomatic, and military work with attendant artistic interests, and his family life. We would like to know what he used for a personal chapel, and when he attended mass in the Cathedral of Caesarea.

Epitomizing this lack of information from the Holy Land, the Noailles Continuation succinctly – and not completely accurately – states: "In 1251 the king of France fortified Caesarea;

Peter [read: Nicholas] Larcat was made archbishop of Tyre; Bohemond [V] died; his son Bohemond [VI] became prince and count after him."[184]

1252: The Noailles Continuation continues: "In 1252 King Louis fortified Jaffa, and his mother, the lady Blanche, died. King Louis knighted Bohemond, prince of Antioch, at Jaffa. Julian, lord of Sidon, married the daughter of Hethoum, king of Armenia."[185]

Bohemond V died in January 1252. He left two children. Plaisance, his daughter, a young girl of about seventeen, had married Henry I of Cyprus a few months before. Bohemond, his son who was only fifteen years old, was to be his successor. He greatly impressed Louis, and certainly Joinville describes Bohemond with words of warm praise during his visit to Jaffa some months later, accompanied by his mother, Lucienne. It was on the occasion of that visit that Louis knighted Bohemond "with high ceremony,"[186] probably in the Church of St. Peter, the most important church in the city.[187] Moreover, Bohemond also requested that he be given in effect his majority rights to rule in Antioch as soon as possible. He wished actively to intervene and restore the authority of his dynasty there, counteracting the negative influence of his unpopular mother, the acting regent, who had largely abandoned Antioch for Tripoli.[188] The king was strongly interested in promoting the strength of the Crusader States overall as well as the Latin Kingdom, and this was an excellent opportunity to reintegrate Tripoli and Antioch, while reconciling Bohemond VI with his mother.

Given the king's interest in his young friend, Bohemond, it is perhaps not surprising that Louis not only knighted him, but also granted him the personal favor of quartering his arms with those of France, because he had Capetian ancestry. This is a rare specific indication of heraldic activity, almost all of which goes unmentioned, despite its obvious importance and growing prominence.[189] It was soon after this visit that Bohemond VI also apparently mints a new gold coin in response to the legate's complaint over Crusader coinage that imitated Muslim models. It is a gold bezant with the rare *Agnus Dei* design on the obverse, on which the motto, *Christus Vincit, Christus Regnat, Christus Imperat*, was used. The motto appears only later in France on gold coinage issued in 1266. The Crusader coin is an issue on the two-thirds gold standard currently found in coins from Acre and Tyre in the Latin Kingdom. Forceful arguments have been advanced attributing this rare and unusual issue, however, to Antioch by both Grierson and Jordan.[190] Thus this remarkable coin marks an especially close bond between Louis IX of France and Bohemond VI of the Principality of Antioch.

Meanwhile Louis continued his diplomatic negotiations, by which he in fact largely established and maintained his position as ruler in the Latin Kingdom. As his discussions with the Muslims continued, the Templars attempted to influence the king to favor an alliance with an-Nasir Yusuf in Damascus, partly because of their own cordial relations with the sultan. Indeed in one celebrated case, the Templars exceeded their authority in negotiations with Damascus, and the king had to step in. The Templars had arranged a land deal with the sultan on their own, and the Master of the Temple asked the king for his approval. As Joinville reported it, "the King was astounded that he should have been so bold as to negotiate or have any discussion with the Sultan without consulting him [first]."[191] Louis then required a public retraction of their treaty from the Templars in the presence of the sultan's emir, followed by a symbolic submission of the master and the knights to the king's authority. Finally Louis IX banished Brother Hugh, the Templar who had carried out this diplomatic mission, from the Latin Kingdom. This was a forceful show of strength on the part of the king, meant to demonstrate his authority de facto in the absence of any political position de jure. It was all the more impressive because the Master of the Templars was a personal friend of Louis's, who was the godfather of his son, Peter, who had been born in Chastel Pelerin the previous year.

Indeed, it is interesting that during the ongoing diplomatic activity between Louis and an-Nasir Yusuf, the sultan of Damascus himself, tried to sway the king by an offer of safe conduct for a pilgrimage to the Holy City of Jerusalem. Louis obviously would have liked to make this pilgrimage, but he realized this was a matter of state, not a personal decision, so, as was his custom, he called a council. No one was in favor of him accepting this offer. The members of the council reminded Louis of the example of Richard I before him. "They quoted this example to the King [Louis], to show him that if he, who was the greatest of Christian Kings, fulfilled his pilgrimage without delivering the city from the enemies of God, all the other Kings and pilgrims who came after him would feel that they were justified in making their pilgrimage in the same way as the King of France had made it, and would be little concerned with the deliverance of Jerusalem."[192]

Accordingly Louis turned down this offer, while he continued his attempts to arrange a new truce with the Mamluks, always with his goal of freeing the prisoners in mind. Eventually, in March 1252, a new agreement was reached. By the terms of this fifteen-year truce, all prisoners would be repatriated on both sides, and the sultan agreed to release the king from any further payment of the ransom money. By these provisions the sultan wished to ensure that Louis would not desert him for the sultan of Damascus. The Rothelin Continuation also mentions one new and peculiar provision, that "all renegade Christians, converted willingly or by force, were given leave to go freely back to the king and to Christendom." Finally, for his part of this alliance, Louis IX agreed to participate in a joint campaign with Aybeg against an-Nasir Yusuf.

The king's reward for this activity would have been the restoration of the territory of the Kingdom of Jerusalem to its full extent by military action. But an-Nasir Yusuf acted decisively to block this threat. As soon as he learned of the new alliance, he marched his troops once again to Gaza, effectively splitting the allies. Louis moved southward from Caesarea to Jaffa, but the Mamluks could not move out of Egypt. A stalemate resulted among the three parties over the next year. There was continual diplomatic activity. "The king sent numerous envoys to the sultan, and so did the sultan to him, but it all came to nothing. They did nothing whatever about returning the Holy Land as they had agreed." Louis in fact remained in Jaffa between May 1252 and June 1253, where he "had the town enclosed with ramparts, towers and ditches."[193] This, according to Pringle, constituted the entire wall system around the lower town.[194]

Jaffa was a more important port for the Crusaders than Caesarea, and it was now the southernmost fortified city in the Latin Kingdom along the coast, so the king's attention was justified. Joinville, however, makes it clear that the king invested not only his time, but also a great deal of money in the fortification of Jaffa. "It is impossible to reckon the enormous sums of money the King spent in fortifying Jaffa; it was beyond any estimate. He built a wall with twenty-four towers round the town, from the sea on one side to the other, and the mud was cleared out of both the inner and outer ditches. There were three gates, one of which, with a section of the wall, was made by the Legate." Joinville estimates that the gate and the section of wall cost the legate eight hundred livres tournois; the legate himself said it cost a good thirty thousand livres tournois. Joinville is no doubt more accurate in this case, and extrapolating his numbers we can estimate the overall cost of the work here at Jaffa sponsored by the king at something approaching twenty thousand livres tournois.[195] No doubt Louis was able to improve the fortifications at Jaffa significantly, but work was still not completed as late as the 1260s.

Here again, after discussion of the diplomatic embassies and the king's sponsorship of new military architecture, the sources largely go silent with regard to the king's activities while he was in Jaffa through the summer and fall of 1252. We must imagine the personal routine of the king to be continued while he was in residence here, as it had been set up in Acre and Caesarea before this, with his balance of spiritual, governmental, and diplomatic, as well as personal and artistic interests and responsibilities ongoing on a daily basis. The important anecdotal history by Joinville certainly supports this view, along with other narrative sources for the canonization of Louis IX, such as the works of William of St. Pathus and Geoffrey of Beaulieu. For example, at Jaffa, William of St. Pathus describes the king's generous bequests to the Franciscans. Louis IX founded "the church and the house of the Friars Minor... and had made ten chalices of gilded silver [and vestments] and other church ornaments for the ten altars which are there... and had books made for saying the divine service and for the study of the brothers, and provided the said house with beds and other hospitalary provisions which it needed."[196] On the basis of this kind of evidence we can assume that the king maintained his heavy schedule and energetic activities, which included artistic commissions, and which may have included occasional forays outside the city as needed. The question in the case of Jaffa, as with Caesarea and Haifa, is whether effectively all of the important artistic commissions such as manuscripts were produced in Acre for the king, or whether any of them could have been done for him in his then current city of residence.

1253: The Noailles Continuation records:

> In 1253 Saracens from Damascus appeared outside Acre. They destroyed [the mills of] *Doc* and *Ricordane*, took Sidon, killed 800 or more men and carried off 400 or more prisoners, masons and others. The king fortified Sidon once again.
>
> Henry, king of Cyprus, died, and so did... Walter, bishop of Acre, and Nicholas Larcat, archbishop of Tyre. After him Giles from Damietta was elected as archbishop. Hethoum, king of Armenia, travelled to the Tartars.[197]

As the year began, Henry I of Cyprus died, on 18 January 1253. Because the Hohenstaufen, Conrad IV of Germany, had still not claimed his crown, Queen Plaisance of Cyprus was recognized as having the right to act as regent for Henry's son, the infant Hugh II. Perhaps because Louis IX was still resident in the Holy Land, however, she did not come to claim the regency at that time; in fact, she did not come to Acre to be recognized by the barons until 1258, that is, long after Louis had sailed home and the destructive war of St. Sabas was over.

During the winter months of 1252–3, the disappointing response from the Mongols carried by Louis's first envoy to the Mongols, Andrew of Longjumeau,[198] had been replaced by more interesting news. A report had reached the Latin Kingdom that one of the Mongol princes, Sartaq, had converted to Christianity. Louis IX hastened to send two Franciscans, a Fleming, William of Rubruck, and an Italian, Bartholomew of Cremona, to explore an alliance with the Mongols against the Muslims. The king's interest reflected his hope in finding some kind of grand alliance that would win and safeguard the Holy Land. He provided the financial wherewithal and presented William with a Bible; Queen Marguerite is reported to have given him an illuminated psalter.[199] The envoys set out with a priest and an interpreter probably in March 1253.[200] Going by way of Constantinople, they embarked from there on 7 May 1253 and reached the Crimea later in the month. William eventually reached the Mongol prince in July, but although Sartaq showed interest in William's books, no alliance ever came of this visit, and William of Rubruck was not allowed to preach and evangelize in Sartaq's lands. William, of course, went on to Karakorum and met the great Khan, Mongka, recording his experiences in a memorable and important journal, but again his visit did not lead to an alliance.[201]

From the point of view of artistic commissions in the Crusader Kingdom, it would be extremely interesting to know what kind of Bible William had been given, that is, was it in Latin or in Old French and was it illustrated? Similarly, we would like to know about the illustrated psalter, which was presumably in Latin; what was its program of decoration? Certainly it garnered a lot of attention because of its gold illuminations.[202] Both of these books appear to have been personal gifts given to William of Rubruck, not diplomatic gifts to be given to Sartaq. Where were they done? The king and queen were in Jaffa when they gave these gifts to William. Could they have been done there, or were they commissioned in Acre and delivered there before William and his associates set out for Constantinople? Here again we have evidence of Louis IX offering books as gifts, just as he did to the Franciscans in Jaffa. The likelihood is that if the books were done in the Levant, they had been done in Acre. Certainly we know specifically in William of Rubruck's case that when the king also gave him letters to be delivered to the Mongol prince, William says specifically that he had translations of them done into Arabic and Syriac, in Acre.[203] St. Jean d'Acre was presumably the most important Crusader center, not only for scribal work, but also for illumination and for book production with parchment makers and binders.

Louis's time in Jaffa effectively ended when new developments in the Muslim world forced him to move northward. In April of 1253, the caliph of Baghdad had succeeded in mediating the hostilities between the sultans of Damascus and Cairo. In these circumstances, the army of an-Nasir Yusuf could finally leave Gaza. They marched up the coast past Jaffa, where they skirmished with the king's men, and then on to Acre, where they captured and destroyed two corn mills, Doc and

Recordane, outside the city, as recorded by the Noailles Continuation. Then they moved on to Sidon, which was held by a small garrison. Joinville reports that the Muslim troops entered the city, "killed more than two thousand of our people and returned to Damascus with the plunder they had taken. When the King heard the news he was greatly angered."[204]

In response to this situation Louis decided to move his army to Sidon and strengthen the fortifications there, leaving aside the project he preferred, a castle on the road from Jaffa to Jerusalem. As he marched northward, he camped at Arsuf, a securely fortified location along the coast. Here Louis proposed that he and his army could march inland and capture the important city of Nablus. Interestingly, the barons and leaders of the military orders advised him to send his army, but not to go himself, arguing that "if anything happened to him the whole country would be lost. The King replied that he would not allow them to go unless he accompanied them himself. The matter was left there, as the local lords refused to agree to his going."[205] The anecdote demonstrates with what esteem Louis was held and shows once again the reserve with which the local barons viewed Crusader army attacks inland that risked defeat and would be difficult to sustain even if successful.

So the Crusader army moved on to Acre where it camped again, and Joinville tells another enlightening story. Here at Acre a large group of pilgrims were on their way to Jerusalem from Greater Armenia. When they heard that Louis IX was camped at Acre, they requested an audience with the "holy King," but Joinville joked that he did not want to kiss Louis's bones just yet. Louis is reported to have laughed out loud but dutifully agreed to receive them. Here we see another demonstration of the king's widespread reputation. We also find evidence for the continuous phenomenon of Christian pilgrimage to Jerusalem, even when Jerusalem was in Muslim hands and, as in this instance, it meant payment of "a heavy toll to their Saracen escort."[206]

As the army moved deliberately up the coast, they camped at Tyre. Here a council was held on the advisability of attacking the town of Baniyas to the east, near the headwaters of the Jordan River. Again the recommendation was made that a force could be sent, but the king should remain behind and not go himself. In this instance Louis agreed, perhaps because the local lord, Philip of Montfort, and the military orders were interested in this foray, while Louis wanted to move on to Sidon. The Crusaders skirmished with the Muslims at Baniyas without success, and then rejoined the king at Sidon. At Sidon, "we found that the King himself had had the Christians buried whom the Saracens... had killed. With his own hands he carried the rotting and stinking corpses to be laid in the earth in trenches, and never stopped his nose as the others did. [Then] he gathered labourers from all parts and set himself to refortifying the city with high walls and strong towers."[207]

Louis's personal participation in the work of his troops was quite celebrated, but none more than when he personally assisted in the burial of the dead defenders of Sidon with his own hands. This pious act was singled out in the formulation of the illustrations for the "Hours of St. Louis," which later appeared in the Hours of Jeanne d'Evreux in Paris by 1328.[208] Not surprisingly three of the eight scenes in these hours depict Louis on Crusade, two of which pertain to his expedition in 1248–54. The iconography of the miniature follows the details of Joinville's account, showing the king handling the dead without covering his nose, while all those around him try to avoid the stench.

Even though his more mundane work of directing the repair and strengthening of city defenses and of construction of new fortifications was not recognized as part of his exemplary works of mercy and charity or as evidence of his spiritual rectitude, found in the program of psalter illustration, nothing Louis did during these years aided the Latin Kingdom more. It may be surprising that he did not stop to work on the walls of Tyre at some point in his activities, but the fact that he did not seems to indicate that they had already been largely repaired after the serious earthquakes of 1170 and 1202.[209] Furthermore, at Sidon the need was urgent in light of the recent Muslim attack, the damage that had been done, and the number of Christians killed. Accordingly, the work at Sidon pertained to both the land castle, which was subsequently destroyed in modern times except for some surviving fragments, and to the sea castle, which had been started by German Crusaders in 1227.[210] Only the famous sea castle substantially survives, in which archaeological study has shown several phases, the second of which has been attributed to the time of Louis IX (Figs. 96–100, Chapter 5). When his work was done, Joinville commented that he had fortified Sidon, "with high walls and towers and with deep ditches on both sides, well cleaned out."[211]

When Louis had just arrived in Sidon, in June and July of 1253, certain important new developments occurred in his own family that would be important for his future in the Holy Land. On one hand Louis and Marguerite had a third child born in the Levant, Blanche, named for his mother, probably in June 1253. Marguerite had stayed behind at Jaffa to have the child, and sailed to Sidon after the birth as Joinville explains. This child further associated the king and queen with the Holy Land. Unlike the son, known as John Tristan, future count of Nevers, who had been born in the most difficult moments of his parents' time in Egypt, in Damietta in 1250, their two recent children, Peter, born in 1251, and the new infant Blanche, born in June 1253, entered life in happier circumstances in the Latin Kingdom. Louis was successfully carrying out his goals of aiding the Holy Land and freeing the prisoners. Naming their new daughter for his mother, was an especially touching gesture. Their first child, born in 1240, had also been a daughter named Blanche, but she had died in 1243. Louis was clearly dedicated to his family, but remarkably Joinville felt that he was not kind enough toward them. This opinion is expressed when Joinville tells of Marguerite's arrival with the new baby girl at Sidon, where he comments,

> I had been with him [Louis IX] then for five years without his ever, to my knowledge, mentioning the Queen or his children to me or to anyone else;"et ce n'estoit pas bone manière, si comme il me semble, d'estre estrange de sa femme et de ses enfans," that is, "and I do not think it kindly so to be a stranger to his wife and children."[212]

This new daughter enabled them again to demonstrate how much Louis especially loved and honored his mother. Unfortunately his mother could not have known because she had died in France in November of 1252. News of her death only reached Louis and Marguerite later in the summer of 1253 at Sidon.[213] The king was greatly saddened; for two days he could not speak because of his grief. He now had three children who would never know their grandmother. The king had numerous services held in her honor. Marguerite mourned openly as well, but when Joinville wondered at her show of grief over someone with whom she had had difficult relations in life, the queen said simply, "it was not for the Queen [Blanche] she wept, but for the sorrow of my Lord the King and for his daughter (who was afterwards the Queen of Navarre)" and who was now left alone in France.[214]

While Louis pondered how to proceed in the face of this news – profoundly sorrowful for him personally, and disturbingly disconcerting with regard to the political well-being of his kingdom – construction work at Sidon went on. Joinville, clearly suspecting that Louis would not be staying much longer in the Holy Land, prevailed on the king to allow him make his own personal spiritual journey:

> I asked the King to allow me to go on a pilgrimage to Our Lady of Tortosa, which was a great place for pilgrims, being the first altar in the world to be built in honour of the Mother of God. There Our Lady used to work great miracles.

Tortosa was, along with Nazareth, one of the two most revered sites in honor of the Virgin in the thirteenth century. The great church there had been finished earlier in the century, as discussed earlier. Joinville would have no doubt taken some special gifts to the Virgin's shrine in the church at Tortosa, but unfortunately he does not mention them. What he does mention is that Bohemond VI "received us with all the joy and honour he could show us, and would have loaded me and my knights with gifts had we been willing to accept them. We would not, however, take anything except some of his relics, a number of which I brought back to the King."[215] We would like to know what these relics may have been and to have descriptions of their vessels, but even in the absence of any details, we can clearly see how important exchanges like this were and we can imagine how frequently they occurred. Plainly the Crusader metalworkers in the major cities would have been active continually in preparing works of this sort.

It is no surprise that Bohemond VI should have been so solicitous about and so generous to Joinville, given his warm relations with Louis IX. What is again problematic is that although Joinville fills his narrative with anecdotes of his and the king's experiences, once again there appears to be little material dealing with the fall and early winter of 1253–4. What we can say is that the laborious process of constructing the fortifications at Sidon must have been continuing, in parallel with the reports of the king's residencies at Acre, Caesarea, and Jaffa. But apparently because of the nature and structure of Joinville's notes, he does not attempt to clarify the later stages of the king's activities at any of these places, choosing instead only to discuss certain selected events he identifies as significant.

Furthermore, it is no doubt during the time of his pilgrimage to Tortosa that Joinville carried out a special personal mission, one which he also fails to record in his account. Jean de Joinville's uncle, Geoffrey de Joinville, had visited the Holy Land during the Fourth Crusade. Unwilling to go to Constantinople, he was one of the Crusaders who broke away from the main army to fulfill his vow. During this time he had visited Crac des Chevaliers, had died there, and was buried in the castle chapel. His shield, which had his arms quartered with those of England, hung in the chapel along with those of other Crusaders. During his trip to Tortosa, Joinville must have visited Crac des Chevaliers himself during which time he retrieved his uncle's shield and eventually took it back to France, where it hung in the collegiate church of Joinville until 1544.[216]

1254: The Noailles Continuation states:

> In 1254 the rebuilding of the walls of Sidon was completed and the king went away to Acre. He knighted Balian of Ibelin, the lord's son, who later married Plaisance, the queen of Cyprus.
>
> After St. Mark's day the king set out from Acre with the queen and their people to go across the sea. He left one hundred knights with my lord Geoffrey of Sergines, seneschal of the kingdom, to defend the kingdom of Syria.

Then comes a whole list of deaths, a large and important number, along with certain other notable events:

> Martha, lady of Sidon, died on 5 June. Next day Peter of Beaune, marshal of the Hospital, died.
>
> On 21 May King Conrad died. Then on 8 June Robert, patriarch of Jerusalem, died. The patriarch Epice [Opizo dei Fieschi] landed in Acre; John of Ibelin, count of Jaffa, was regent of the kingdom.
>
> The legate Odo [Eudes of Châteauroux] bishop of Tusculum left Acre in mid-September to go across the sea.
>
> Then Bohemond, prince of Antioch, married Sibylla, daughter of Hethoum, king of Armenia.
>
> Then in December Pope Innocent died, and was succeeded by Alexander.[217]

Since learning of the death of his mother, Louis had heard disconcerting reports from France. "The King of England began to make trouble, in spite of an oath to go on Crusade; .... Civil war broke out over the inheritance to the county of Flanders, and all the great vassals of France were growing restive." Louis prepared to return home.[218] As part of his preparations, he concluded a truce with sultan an-Nasir Yusuf in Damascus. This agreement, signed in February 1254, was to last for a shorter time, two years, six months, and forty days, but at least Louis's dealings with the Mongols had made the Muslims on the borders of the Latin Kingdom interested in dètente.[219] Then Louis, according to his customary procedure, took council with the great men of the Latin Kingdom who gave him the following opinion, as recorded by Joinville:

> "Sir, you have fortified the city of Sayette [Sidon], and that of Caesarea, and the town of Jaffa, which is of great service to the Holy Land; and you have greatly strengthened the city of Acre by the walls and towers you have built. Sir, we have consulted among ourselves and we do not see that your further stay can in any way benefit the Kingdom of Jerusalem. Hence we urge and advise you to go to Acre this coming Lent and prepare your crossing so that you may leave for France after this Easter." On the advice of the Patriarch and the barons the King left Sayette [Sidon] and went to Sur [Tyre], where the Queen was; and from Sur [Tyre], at the beginning of Lent, we went to Acre. On 24 April, the vigil of St. Mark's day, Louis sailed for France. On St. Mark's day the King told me that he was born on that day, and I told him that he might well add that he was born again on that day, for his escape from that dangerous country was certainly a second birth.[220]

Louis was, however, not out of danger yet. Twice on the journey home, the king and his family were in mortal peril, and both times by quick thinking the queen intervened to save their ship. They finally arrived at Hyères in Provence, territory controlled by his brother, Charles of Anjou, in July 1254.

In this manner Louis ended his first Crusade. How can we evaluate his service in and to the Latin Kingdom? First, King Louis IX poured the financial resources of his kingdom unstintingly into the Latin Kingdom of Jerusalem to strengthen and revitalize it. Jordan characterizes these expenses as follows:

> For fortifications constructed in the Holy Land after he left Egypt, he spent ninety-five thousand pounds [ninty-five thousand livres tournois] according to one governmental estimate. It is unlikely that "fortifications" include military equipment like horns and glue which he purchased at about the same time for making crossbows. Nor did the "end" of the crusade in 1254 bring his expenses to a close. To fulfill traditional etiquette, he gave pensions and gifts to some of the men who served him, and he also spent an average of four thousand pounds tournois per year from 1254 until 1270 for a contingent of knights who remained in Acre after his departure for France.[221]

This investment is clearly recognized in regard to architectural projects and certain expenses, but by no means fully, in the terms of the financial accounts. Yet the written sources are constantly if sporadically referring to bequests, diplomatic gifts, liturgical items, and books – works of art – that the king and queen gave out during their residency in the Latin Kingdom. Together with the extant works that can be identified and that will be discussed later, we can begin to glimpse how Louis's presence strongly stimulated and even caused the means of artistic production to be reorganized, especially in Acre.

Second, he worked unstintingly to liberate Crusader – indeed, all Christian – prisoners from Muslim prisons. This goal was clearly a unifying vision, which Louis maintained unswervingly until he had achieved it in 1252, after two years of long and arduous negotiations. No matter what other obligations he took on, he saw his primary responsibility as the leader of the Crusade to look after his soldiers. He clearly felt that one of the most important things he could do to right the wrong represented by the failure of his expedition to Egypt was to gain the return of all prisoners.

Third, the king pursued a surprisingly aggressive and varied diplomatic campaign to build alliances that would ensure the well-being of the Latin Kingdom. He pursued this internally by attempting to build and strengthen the peace and harmony of the barons in the Crusader States. He pursued this in the region by vigorous negotiations with the various Muslim sultans, leading eventually to a fifteen-year truce in 1252 with the new Mamluk sultan in Egypt and a shorter two-year truce in 1254 with the Ayyubid sultan in Damascus, among others. He pursued this policy on the larger world scene with his attempts to engage the Mongols in an alliance against the Muslims. Although wholly unsuccessful, these Mongol missions produced the beginnings of a significant enlargement of European cultural awareness of Eastern lands, both near and far.

Fourth, and finally, Louis provided moral and political leadership for the Latin Kingdom at a time that it was sorely needed. Even though he was not officially recognized as king of Jerusalem by the High Court or by the pope, he was ruler in the Latin Kingdom in almost every meaningful way. He engaged the responsibilities of leadership vigorously and asserted his authority forthrightly so that the powerful and wealthy, such as the church, the military orders, and the great barons, as well as the weak and poor of the kingdom could recognize the importance of what he was doing.

In sum, it would be difficult to overestimate the importance of the king's efforts to "aid the Holy Land," as he thought of it. But the symbol and indeed the ongoing visible demonstration of his commitment to the Latin Kingdom was the "French regiment" he sponsored and left under the command of Geoffrey of Srgines at St. Jean d'Acre. In a recent study, Jonathan Riley-Smith has discussed this contingent of soldiers at some length, explaining their importance as part of the continuing involvement of the French crown with the Latin Kingdom in the years after 1254. As we shall see, their presence was apparently significant not only for the defense of the realm, but also for Crusader artistic developments as well.[222] I attempt to discuss the king's artistic impact in more detail in the second part of this chapter. Nonetheless, it is already clear that his significance was great in virtually all media. This is plainly evident not only in architecture, which he sponsored so generously, but also in the figural and liturgical arts about which there is constant mention in the sources, albeit with relatively little surviving that can be identified as his personal commissions.

THE CRUSADER STATES TO THE FALL OF ANTIOCH: 1254–1268

When Louis IX departed for France on 24 April 1254, the Latin Kingdom and its capital city, St. Jean d'Acre, was perhaps in the best military condition it would ever be in the thirteenth century. The defensive walls of Acre had been substantially strengthened; a new contingent of French knights, the French Regiment, had been installed to help protect the city and the kingdom; and major fortifications had been built or rebuilt at Caesarea, Haifa, Jaffa, and Sidon as well. Furthermore, the king had concluded truces with both the Ayyubid sultan of Damascus and the Mamluk sultan of Cairo, leaving the kingdom in a stable and peaceful situation.

But there were problems on the horizon. Both the kingdoms of Jerusalem and Cyprus were ruled by regents; the patriarch of Jerusalem, Robert of Nantes, had died in June, and his replacement was delayed by the death of the pope, Innocent IV, in December. The new patriarch, James Pantaleon from Liège, was appointed in April 1255, but only arrived in the Holy Land in June 1256.[223] A new bishop of Acre, Florence of Laon, also arrived a few weeks later.[224] This means that there was a certain leadership vacuum created by the departure of Louis IX and with the temporary appointees acting in positions of authority in the Latin Kingdom, both politically and ecclesiastically. The real holders of power were those who Richard calls "the men of the communes," above all, the Italians.[225] In the absence of royal power, the mercantile communes were not only major economic, but also major political forces. Then within two short years in 1256, the kingdom was plunged into a new civil war focused on the rights of the major Italian maritime powers, the War of St. Sabas. It appears that the realignment of power that resulted from that conflict, in which the Venetians defeated the Genoese with the help of the Pisans, later also assisted by the merchants from Marseilles, enabled the Venetians to establish commercial dominance in Acre and caused the Genoese to reorganize and move to Tyre. The smoldering animosities among the Italian merchants continued to complicate commerce all along the coast of Syria-Palestine during and well after 1258, and we should recall that this local conflict was only part of a much larger struggle for economic power by these maritime cities in the eastern Mediterranean.[226] We shall wish to evaluate the effects of this conflict not only for their economic and political impact on the Latin Kingdom, but also with regard to what extent they became visible in the artistic production of St. Jean d'Acre.

Louis IX had hardly left the Latin East when Conrad IV of Germany died, in May 1254. The crown of Jerusalem thereby passed to his two-year-old son, Conradin, as recognized by the pope. By September a new regent, Count John of Jaffa, was appointed by the High Court in Acre. This John d'Ibelin, count of Jaffa, lived until 1266 and is, of course, the author of the most important Crusader legal text written in the thirteenth century, the *Livre des Assises*.[227] He held office for two years, until other duties called, at which time in 1256 he was replaced by Count John of Arsur.[228] Not to let peace erode, the *bailli* and the great lords of the kingdom renegotiated a new truce with the Muslims, including both major sultans, signed in February 1255. By this arrangement, the Muslims agreed to recognize Crusader land west of the Jordan River down to Arsur, but Jaffa was explicitly excluded. To protect Jaffa, Geoffrey of Sergines therefore installed his men there in December.[229]

Because of its exempt status, Jaffa was the flashpoint for skirmishes between the Crusaders and the Muslims. Despite their small numbers, the garrison at Jaffa was cautious and disciplined; they successfully attacked the Muslims on occasion and withstood all Muslim attacks. During one of their counterattacks, John of Ibelin, count of Jaffa, lost his horse and was nearly killed; he was only rescued by the Hospitallers fighting with them. By his stalwart military action, including winning this victory and killing the emirs of Bethlehem and Jerusalem, Geoffrey induced the sultans of Damascus and Cairo to agree to a renewal of the truce, reset for ten years, ten months, and ten days from the winter of 1256, probably February or March.[230]

Meanwhile however, serious trouble had emerged in Acre. As the Rothelin Continuation describes it, "the Christians began to make shameful and wretched war on each other, both sides being equally aggressive. Discord broke out between the Venetians, the Pisans and the *poulains* of the land on the one hand, and the Genoese, the brothers of St. John's Hospital who supported them, and the Spaniards on the other. This was over a building standing by the sea between Genoese and Venetian territory, and the fighting went on for nearly a year. They slew and slaughtered and did each other all the harm they could, just as they did to Saracens."[231]

Louis IX had left Acre in April 1254, and by 1255 the Genoese and the Venetians were in serious conflict in the Latin Kingdom,[232] the result of a rivalry that had been brewing since the early 1250s. Until 1256 the rivalry had been controlled: during Louis IX's residency by means of a treaty signed in 1251; in the larger Mediterranean setting, by a Genoese-Pisan war that was successfully concluded by the Genoese in 1256. A series of incidents between the Genoese and Venetians in Acre eventually led to a confrontation.[233] Both "nations" claimed the property of the Monastery of St. Sabas atop the low hill of Montjoie[234] between their two quarters inside the city.[235] So intense was this dispute that litigation had been initiated in the papal court in that year, 1255, which was ongoing. But in 1256 open war broke out – the War of St. Sabas – when the Genoese forcibly seized the monastery property and then attacked the Venetian quarter itself with Pisan support, inflicting heavy damage. At this point, while Genoa was winning, it enjoyed widespread support in Acre also among the barons. At the same time, Philip of Montfort saw his opportunity to drive the Venetians out of Tyre, abrogating their trading rights in that city, rights that went all the way back to 1124. Clearly this conflict was a major local manifestation of the struggle for commercial dominance among the Italian maritime powers in the eastern Mediterranean. But it had dangerous and deleterious effects on the Latin Kingdom.[236]

The Venetians regrouped after the attack by the Genoese, and despite an eventual Genoese offer to negotiate when tempers cooled, the Venetians prepared for war. As preparations went forward, everyone reconsidered the situation and began the process of choosing up sides, with some strange alignments. The Genoese were supported of course by Philip of Montfort at Tyre, along with the Embriachi, lords of Gibelet, while at Acre their supporters were the Hospitallers, the Catalans, the Anconitans, and the Greek Orthodox community. The Venetians meanwhile had persuaded the Pisans – allies of the Genoese since 1251, but actually ancient enemies – to join them along with the merchants of Marseilles. They also won the important allegiance of the powerful Ibelin family – including John of Jaffa, the *bailli* – along with the Templars, the Teutonic Knights, the confraternities of the city, and Bohemond VI, lord of Tripoli and Antioch. It had hardly been twenty-five years since the civil war between the Ibelins and the Imperialists, and the new conflict caused old enmities to resurface with renewed hatred, for example, between the Hospitallers and the Templars. There were also some odd realignments, such as finding the Hospitallers and the Genoese on the same side.[237]

With everyone at daggers drawn, it was nonetheless the Italians who did most of the actual fighting. The Genoese, realizing later in 1257 that the Pisans had defected to the Venetian side, attacked and annexed the Pisan quarter in Acre. At that point a large Venetian fleet arrived at Acre, commanded by Lorenzo Tiepolo. Breaking through the chain that closed off the harbor, his ships were able to dock. The Venetians successfully landed their troops and attacked the Genoese, liberating the Pisan Quarter, and capturing the contested house of St. Sabas, while inflicting considerable damage on the city, but they ultimately failed to dislodge the Genoese from their own quarter. Subsequently most of the fighting was done at sea, with open warfare in the shipping lanes, bringing commerce almost to a halt. Eventually, on 23–24 June 1258, a great naval battle was fought off the coast of Acre. The Genoese fleet commanded by Admiral Rosso della Turca actually outnumbered the Venetians under Lorenzo Tiepolo, with fifty Genoese galleys and four large round ships versus thirty-nine Venetian galleys, four large round ships, and ten tarettes. Nonetheless, the Venetians won a great victory, destroying half the Genoese fleet and taking a reported 1,700 prisoners.[238] About the same time an attempt by Philip of Montfort to march on Acre was fought off by troops of the city confraternities. The Genoese subsequently withdrew from Acre to Tyre, where they made their headquarters. As a symbol of this victory, the fictive story arose that

the Venetians carried off two beautifully decorated piers from the Genoese quarter as trophies, which they set up on the east side of San Marco in Venice, the so-called *pilastri acritani*[239] (Figs. 132–134); in fact these piers come from the sixth-century church of St. Polyeuktos in Constantinople, from where the Venetians brought them to Venice after 1204. The hostilities elsewhere at sea continued unabated between the two powers, however, and the war flared up in Acre again in 1267. Only Louis IX was able to mediate a truce between the two in 1270.[240]

The result of this civil war was that the Latin Kingdom was terribly divided after 1256, and its economic lifeblood was seriously threatened. Just as a civil war had weakened the Latin Empire in the 1250s followed by the Byzantine Greek restoration in Constantinople in 1261, the Latin Kingdom might have suffered a Muslim conquest at the time of this civil war when the mainland Crusader States were dangerously vulnerable. During the internal hostilities raging in the Latin Kingdom, the Crusaders were spared Muslim intervention, however, because of a major political upheaval in Cairo, with the deaths of Shajar ad-Durr and Aybeg, and the advance of the Mongols from Iran threatening Syria. Unfortunately the temporary end of the land hostilities in the war of St. Sabas did not bring stability. One of the striking developments in the Latin Kingdom during the war was the disintegration of political solidarity in the face of hostilities among the Italians, with people taking sides according to the exigencies of the moment. The civil war began to involve everyone.

Because of the serious fragmentation evident during the War of St. Sabas, substantive attempts were initiated to heal the deep divisions in the Latin Kingdom. Some succeeded, but some failed. One example of the latter is that Queen Plaisance, regent designate for the kingdom since 1253, was brought to Acre by Bohemond of Antioch, her brother, at the insistence of John of Jaffa and the master of the Templars, in February 1258 with her son, Hugh II, in an effort to effect peace in the Latin Kingdom. At this time the lords formally swore allegiance to Hugh as the rightful heir to the throne after Conradin and recognized Plaisance as regent in fact. As Edbury interprets it, "Plaisance duly ordered the people of Acre to throw their support behind the Venetians. She then withdrew, leaving the former *bailli*, the hitherto pro-Genoese John of Arsur, as her lieutenant."[241] Needless to say, the allies of Genoa tried to object to these arrangements, but in vain; as a result even the attempt to establish a consensus leader in the midst of this chaos was drawn into the partisan battle. This political maneuver was, of course, "vindicated" when the Venetians won the great sea battle in June, but the whole process did nothing to restabilize the kingdom.

Later on that year, when the *bailli* died at the end of 1258, it was remarkable that "the only man in Outremer that

Plaisance could trust was Geoffrey of Sergines."[242] Geoffrey was seneschal of Jerusalem at the time, and commander of the French garrison in Acre, appointed by Louis IX. He "was a Frenchman, and his appointment can perhaps be seen as a move away from the pattern of allowing authority to be exercised by members of the Ibelin family or their clients and allies who between them had in effect governed Acre since the 1230s."[243] Geoffrey's military and political significance should not be overlooked because, as J. Riley-Smith has pointed out, he and his French Regiment of one hundred knights with retainers amounted to approximately five hundred men.[244] This is a substantial force when compared with the estimate of three hundred knights each for the Hospitallers and the Templars, and a smaller number for the Teutonic Knights, in the East at this time.[245] Furthermore, he and his successor were solidly funded by the French crown on a year-by-year basis, and even by a Crusade tithe imposed by the pope in 1262.[246] For the present, however, Geoffrey was appointed *bailli* on 1 May 1259. His appointment was much more effective in attempting to win the peace.

The new *bailli* and the newly arrived papal legate, Thomas Agni of Lentino, the former Dominican prior of Naples sent to Acre in April, proceeded to work to settle the dispute between the Genoese and the Venetians. But even this attempt inadvertently created problems. Unfortunately the pope had appointed his legate as bishop of Bethlehem. As legate, Thomas outranked the latin patriarch of Jerusalem, James Pantaleon, the future Pope Urban IV, but as bishop of Bethlehem, the legate was subordinate to the patriarch in the hierarchy. James left Acre in 1260 to go to Rome to attempt to rectify this situation, among others, as the peace efforts were gaining momentum.[247] Eventually, in January 1261, the legate and the *bailli* succeeded in arranging a meeting of the High Court in Acre where the delegates along with representatives of the military orders and the barons were officially reconciled.[248] Resolution of the issues among the maritime powers was long and difficult in any case, but it appears that the departure of the patriarch did not help in moving peace arrangements ahead. Once the agreement was reached, moreover, the principals honored it almost as much in the breach as in the stated terms; hostilities on the high seas continued relatively unabated. It was only much later, in 1270, that a lasting truce was concluded for five years between the Venetians and the Genoese, instigated by Louis IX, as mentioned earlier. At that time the Genoese reoccupied part of their quarter in Acre, but by then the damage had been done, so to speak, as far as fragmentation of society, loss of territory to the Mamluks, physical destruction to the city, and commercial disruption in the Latin Kingdom and with regard to the Asiatic trade route ending in Acre was concerned.[249]

Fortunately, some internal conditions in regard to political relations within the kingdom did improve in the late 1250s. One concrete example of this can be seen with the military orders, which had had serious disputes among themselves for many years before the War of St. Sabas. There had long been property disputes, many that had required arbitration.[250] The orders as independent entities had also made separate political alignments internal to the kingdom along certain lines from time to time, although as Forey has pointed out, it is not correct to say that the Hospitallers always took a royalist stance, and the Templars always sided with the other lords. Nor is it correct to assume that these two orders always opposed the other in any given situation.[251] But the Hospitallers and the Templars did have a long and unhappy history of serious disagreements, and on occasion had even attempted to enter into separate negotiations with the Muslims, such as the Templars did during the time of Louis IX's residency, as noted earlier. Nonetheless, by 1256 Riley-Smith notes that the orders were making real efforts toward resolving their property disputes, and in 1258 a wide-ranging agreement was concluded among the masters of the three major military orders that pertained to the Latin East, including Cyprus, Syria, Armenia, and Syria-Palestine.[252]

The agreement of 1258 was "so important that it was to be recited each year in their Chapters and by every new Master before twelve brothers of the two other orders. All castellans and commanders in Cyprus, Syria and Palestine were to swear obediance to it; and if it was not observed, a penalty of 1000 silver marks could be exacted from the offending Order by the other two."[253] The agreement set up a system of negotiation and arbitration by which disputes, clearly defined with certain exclusions, could be resolved internally among the orders. Further clauses added important provisions. The orders were required to assist each other – at their own expense, with certain special arrangements – in their battles against the enemy, defined as the heathen. Members of each order were protected from violence by members of the other orders. The orders were prohibited from rivalry or disputes over the acquistion of "immovables" or supplies. With the exception of livestock, members of one order could, if needed, claim supplies from another order, assuming that they could pay for them. Major clauses also provided for the safeguard of feudal rights, with principles, guidelines, and procedures clearly stated. Not only was this agreement drawn up and implemented, but it was also put into practice immediately. Eventually even the pope recognized it, but apparently only much later.

It is a pity that the agreement of 1258 promulgated by the three major military orders with regard to land holdings and material assets could not have been emulated politically and economically by the major factions involved in the War of St. Sabas. Unfortunately, the deep divisions that had fractured the *pax ludovicae* in the wake of his departure were not fully healed, and eventually the Latin Kingdom would pay the price. For the moment, however, the Crusader States in Syria-Palestine were the benefactors of developments far beyond their control. Before we consider those developments, however, let us review what can be identified as some of the main immediate effects of the War of St. Sabas on Acre and the Latin Kingdom.

First, it is clear that a sizeable part of the interior city of Acre was left devastated. Heyd proposed a sobering description of ruin, the result he claimed of more than fifty"machines de guerre" which produced massive destruction and killed at least twenty thousand persons.[254] The sad truth was, furthermore, that the internecine hostilities that had produced this destruction, flared up from time to time, creating more damage. The stables of the Hospitallers in Acre were burned down during another fight between the Venetians and the Genoese, when in August 1267 a Genoese fleet attacked the city.[255] This means that the city of Acre faced the need for reconstruction internally, as well as for maintaining the integrity of their defensive wall system. Obviously, the affected parties would deal mostly with their individual architectural needs, no doubt to the detriment of attention they might have given elsewhere in the city.

Second, the War of St. Sabas was pivotal in changing the power structure among the maritime "nations" in the Latin Kingdom. The Venetians, along with the Pisans, were dominant in Acre, which was the most important Crusader port. Genoa, which had been on top, now began its gradual recession as the most prominent of the Italian city-states, economically, militarily, and politically, in the Crusader States. Genoa was still enormously powerful in the Mediterranean and did not retire from Acre without a long fight, as the continuing hostilities in the 1260s makes clear, but the balance of power was beginning to shift in Crusader Palestine. Furthermore, this power struggle had a major impact on the Latin Kingdom, with new influence exerted by the maritime powers in many spheres as a result, the artistic sphere being the one we explore later.

Third, this change in the power structure was accompanied by a relocation of positions in the major Crusader ports. In Acre, Venice and Pisa largely took over the spoils of the Genoese quarter in the wake of their departure. Genoa established their headquarters in Tyre and left Acre largely to their rivals. This does not mean that Genoa completely abandoned Acre, and as noted earlier, they returned to occupy at least part of their quarter later, in the 1270s. But it does mean that from the latter part of the 1250s, the Venetians and the Pisans were the dominant traders who controlled the most important quarters near the harbor, and they were the most important Italian artistic patrons in Acre.

Fourth, we have seen above that during the residency of Louis IX, a new coin design was initiated in Acre for use in "international" trade, the so-called cross bezant. The extant coins are known to run in a series carrying the dates from 1251 to 1258. As Metcalf points out, "if these dates are to be believed, the devastation of Acre by the War of Saint-Sabas brought the minting of gold to an end."[256] Even though Metcalf qualifies his proposal with certain reasonable considerations,[257] it is entirely possible that this conflict caused an important change in Crusader coinage, even if the change occurred sometime after 1258, probably shortly after 1258.[258] Again, however, we should recognize the fact that the focus of this change was in Acre, but not necessarily elsewhere. For example, in Tripoli, which also developed a gold bezant with Christian symbolism, the so-called Agnus Dei bezant, we do not know that it ceased to be minted at the same time. Although extremely rare today for reasons that are not altogether clear, this coin was also a response to the ban on Crusader coinage that imitated Muslim bezants.[259] The count of Tripoli appears to have continued this issue, however, no matter what impact the War of St. Sabas appears to have had on coinage of the Latin Kingdom minted at Acre.

Finally, in the wider world of the Levant, the War of St. Sabas did, by extension, eventually have a major impact on the Crusader East. In their struggle against the Venetians in the eastern Mediterranean, the Genoese had chosen to support the Greek emperor of Nicaea, Michael Palaeologus. They did this both to damage Venetian interests, and with an eye to strengthening their own trading concessions by moving their Asiatic trade routes north through the Black Sea. To this end, in March 1261, the Genoese signed a major treaty with Michael in Nymphaion, which they ratified in Genoa in July. In this pact he guaranteed them preferential trading status throughout his territory. As a symbol of this alliance, the Byzantines sent the beautiful pallio of St. Lawrence to Genoa, a major work of imperial silk manufacture, inscribed in Latin, bearing the image of the Palaeologan emperor, and presenting the story of the patron saint of Genoa, St. Lawrence, along with two others.[260] It is one of the largest (1.27 × 3.76 meters), most lavish, and important diplomatic gifts to survive from this period, one that embodies the cultural interchange of East and West that we find fundamental to the production of much Crusader art from the Latin Kingdom. Although it has nothing directly to do with the Crusader States in Syria-Palestine, the pallio does exemplify the artistic integration of two cultures – the Byzantine and the Genoese – that we also see in certain remarkable objects of metalwork in the contemporary Near East, such as the brass basins in the Louvre including the "baptistère de St. Louis" (Fig. 323, Chapter 7) and others with Lusignan coats of arms, the latter discussed perceptively by Annemarie Weyl Carr.[261] This luxury textile and this remarkable metalwork forcefully suggest that the interpenetration of artistic and cultural traditions which we have identified as characteristic of Crusader work in the twelfth and thirteenth centuries can now be seen more widely in the Near East, coming from more diverse origins.

When on 25 July 1261 Michael reentered Constantinople with the assistance of the Genoese, the Byzantine Empire was restored. Although the reconquest did not result in the immediate fulfillment of all the promises that had been made to the Genoese, it meant they strengthened their position in the Greek capital, in the empire overall, and in the Black Sea trade. Clearly, they remained the most formidable adversaries of the Venetians in the eastern Mediterranean.[262] Indeed, Genoa continued a period of great prosperity in the second half of the thirteenth century, in which "in terms of wealth and ships, Genoa was as powerful in the 1290s as at any time in its history."[263]

The restoration of Byzantium, of course, brought the tottering Latin Empire to an end, but parts of Latin Greece survived. The Latin Empire had had a negative effect on the Crusader States in mainland Syria-Palestine when it was first established in 1204 by diverting sorely needed men and material from the Latin Kingdom, not to mention steering attention away from the goals of reconquering Jerusalem and aiding the Holy Land. Now that it had died, some of its resources that could have aided the Latin Kingdom, namely, the Italian maritime powers, continued fighting among themselves and thus diverted their attention away from the interests of the mainland Crusader States. Runciman concluded, "the Empire of Romania, the child of the Fourth Crusade . . . had done nothing but harm to the Christian East,"[264] but I think the greatest harm had arguably been done to the Crusader States in Syria-Palestine.

The Latin Kingdom Confronts the Mongols and the Mamluk Sultan, Baybars: 1260–1268

Fortunately for the Latin Kingdom, these years during which Plaisance was active in the regency of the Latin Kingdom were also a time of major upheaval in the Muslim world.[265] In the later 1250s the Mongols had appeared on the frontiers of the Crusader States, having conquered Baghdad, Aleppo, Harenc, and Damascus between 1258 and 1260. To avoid an attack on Antioch, Bohemond and the king of Armenia, Hetoum, his father-in-law, treated with the Mongol general, Hulagu. Because of his diplomatic action Bohemond was given the territory of Latakia, which had been in Muslim hands since the time of Saladin. Furthermore, amazingly, when Kitbogha and the victorious Mongols entered Damascus, Bohemond and Hetoum apparently rode in his entourourage: On this day at the beginning of March 1260, "the citizens of the ancient capital of the Caliphate saw for the first time for six centuries three Christian potentates ride in triumph through their streets,"[266] Kitbogha, a Nestorian, and his two Syrian vassals, Hetoum, an Armenian, and Bohemond, a Latin.[267]

The Templar of Tyre is the sole extant textual source for this event,[268] which has led some scholars to question its veracity. The text reads:

> The king of Armenia and the prince of Antioch joined the Tartar host and were at the taking of Damascus. When Damascus fell, the prince – out of contempt for the Saracens, to shame them – had a most lovely church purified and censed. This church was from the time of the Greek Christians, from the time when Heraclius had had Damascus fortified; the Saracens had worshipped Muhammad in it, but it was orginally the church of the Greeks. He had the Frankish mass sung within it, and had its bells rung.[269]

Several major historians of the Mamluks and the Mongols have expressed doubts about this account, but their reasons vary. It is Peter Jackson whose analysis recently raised the issue in the context of his intensive study of "The Crisis in the Holy Land in 1260."[270] His interpretation of this text, set in the context of the larger argument in which he challenges the idea that the Christians in the Near East missed a great opportunity to forge an alliance with the invading Mongols in the years around 1260, is based heavily on a critique of René Grousset's views and *La Flor des Estoires de la Terre d'Orient*, the latter written by the expatriate Armenian Hayton (Het'um) in France in 1307. Observing with good reason that Hayton includes certain events in his report which are "sheer fantasy" introduced to glorify his people, Jackson proposes that "to a lesser extent, this same *caveat* in favour of contemporary testimony must apply also to the remaining Armenian, and to Frankish sources." In his view it is probably such a later tradition which underlies the statement in the *Gestes des Chiprois* that Kitbogha was accompanied into Damascus not only by King Het'um but also by Bohemond VI of Antioch.[271] Among other such opinions, Peter Thorau says that when Kitbogha made his entrance into Damascus, he was accompanied by al-Sa'id Hasan, the prince of Banyas. He continues, "it is, however, uncertain whether King Hethum and Bohemond VI were also in his company."[272] Amitai-Preiss says cautiously that "while this report certainly cannot be taken literally, it may contain a grain of truth."[273]

By contrast to these Eastern historians, many major modern Crusader scholars accept the account by the Templar of Tyre on this point. Besides Runciman in 1954,[274] there is Joshua Prawer (1975)[275] and Jean Richard (1979, 1999).[276] Hans Mayer (1988)[277] reports these events at the taking of Damascus in 1260, but referring to Jackson, points out that their textual source "has recently been doubted."

Although it is clear that questions have been raised about these events and the unique passage in the Templar of Tyre, there are differences of opinion in both camps.[278] Furthermore, the occupation of Damascus was discussed again by Dominique Sourdel in the Jean Richard Festschrift.[279] The importance of her discussion is that the events cited by the Templar of Tyre are linked to related developments in Damascus during the brief Mongol occupation, while Bohemond was also present, as found in Arabic sources. The fact is, however, that there is additional evidence to consider. I argue later in the discussion of the art produced in this period that imagery on an iconostasis beam now in the collection of the Monastery of St. Catherine on Mount Sinai (Fig. 165, App. no. 105/1744) supports the veracity of the account of the Templar of Tyre on both controversial points. I propose that the imagery on this beam depicts the three Christian rulers who marched into Damascus together and that Bohemond VI appropriated a mosque for Christian use in which he had the Latin liturgy celebrated.[280]

Returning to the events of 1260 following the occupation of Damascus, Kitbogha sent detachments of his army to occupy Nablus, Hebron, and Gaza. He also took Ascalon in the south and Baniyas in the north, but for whatever reason he did not march on Jerusalem. The sultan of Damascus, now beaten, broken, and effectively a refugee, allowed himself to be taken prisoner by the Mongols.[281]

Ayyubid rule in Syria was thereby substantially eliminated with surprising ease by a comparatively small Mongol army.[282] The conquest of the Ayyubids left the surrounded Crusaders to expect a major Mongol attack, one that never came.[283] Instead, the Mongols paused when news of the death of Mongka, the Great Khan, grandson of Ghengis Khan, who died on 11 August 1259, arrived in the Near East. During the power struggle over Mongka's successor, Hulagu withdrew substantial forces to protect his interests farther east, leaving Kitbogha in Damascus with a much reduced army. Meanwhile in Egypt, at just about the same time that Mongol forces were moved eastward, the Mamluks had consolidated power under a new sultan, Qutuz. The attitude of the new Mamluk sultan toward the Mongols was demonstrated early in 1260 when Hulagu's ambassador to Cairo demanding Qutuz's submission was murdered and the order to prepare to march against the Mongols was given.

No further confrontation took place until the summer, when, at the end of July, Qutuz led his troops to Gaza, where they overwhelmed the small Mongol garrison.[284] Duly warned of the Egyptian advance, Kitbogha then prepared to march into the Jordan Valley but was seriously delayed by an uprising in Damascus. At that point Qutuz requested permission from the barons in Acre to lead his troops through the Latin Kingdom and to provision his army en route.[285] The high court met to discuss the matter. A variety of opinions were voiced: The Franks were obviously wary of the Muslim forces, but they were also wary of the Mongols – and unhappy with Bohemond VI, their ally – for what was viewed as his unseemly friendship with the Eastern Christians, with the Armenians, and especially with the Greek Orthodox in Antioch. In the end it was decided to allow Qutuz to make his march, and he even camped in the orchards outside Acre for several days. Several of the important emirs were even invited into the city and Baybars is said to have entered the city in disguise, as a spy, at this time.[286] Indeed, the Franks were somewhat alarmed by the size of the Egyptian army, one that was clearly powerful enough to attack Acre successfully had the order been given. In hindsight, this army was a scary predecessor of the great army of al-Ashraf Khalil in May 1291. But Qutuz was concentrating on the Mongols, who now moved into eastern Galilee.

Hearing of Kitbogha's advance, Qutuz marched southeastward reaching Ain Jalud, "the fountain of Goliath," on 2 September. Ain Jalud is located a few miles west of Belvoir, southeast of Mount Tabor – both of which were then in Muslim hands – and northwest of Baisan. Strange to say, Ain Jalud is not so far from the battlefield of Hattin, where another decisive battle was fought in Galilee in 1187. On 3 September 1260, Mongol forces made contact with the vanguard of the Mamluks commanded by Baybars, while the main Muslim army under Qutuz remained secluded. When the Mongols attacked, Baybars retreated, drawing them into a trap. Surrounded by the large Mamluk army, the Mongols were defeated after desperate fighting; few survived.[287] Kitbogha himself was captured and killed.

The battle of Ain Jalud on 3 September 1260 was one of the pivotal battles in Near Eastern medieval history. From this point on, the Mongols were gradually but steadily diminished as a threat to Syria-Palestine, and the victorious Mamluks began their relentless pressure on the Crusader States. They were to be the dominant power in the Levant for the next two hundred years. The Mamluk ascendency effectively began following the victory at Ain Jalud with the emergence of a powerful new ruler.

When the victorious Mamluk army was marching back into Egypt in October, Baybars treacherously murdered Qutuz while on a recreational hunting expedition.[288] Baybars was immediately recognized by the army as the new sultan on 23 October 1260, and he returned to Cairo to the acclaim of the people.[289] At that point the Mongols attempted to reenter Syria with an army sent by Hulagu to Aleppo. Then they marched to Homs, where a local Mamluk force made up of soldiers from Aleppo, Homs, and Hama scored a decisive victory over the Mongols on 10 December 1260.[290]

It would not be long before the Crusaders would discover an-Nasir Rukn ad-Din Baybars al-Bunduqdari eclipsed the Mongols as a threat. He would become the most efficient and ruthless Muslim foe they had ever encountered.[291] The ominous presence of Sultan Baybars on the scene begins to appear when he leads his army into Syria and attacks Damascus on 17 January 1261. There he defeats the upstart Mamluk emir Sinjar.[292] After establishing his power in Egypt and beginning now in Syria, he was nearing the time he would initiate direct military operations against the Latin Kingdom.

The difficulties for Christians in the Holy Land as the result of Baybars's presence, policies, and activities began even before he ordered any direct hostilities against them, however. When Baybars came to power as the new Mamluk sultan in Cairo,

> the truce eased and the whole land was at war, so that Christians who had gone on pilgrimage to Jerusalem lost many of their people and much property, for when the emir in charge of the city heard of the sultan's [Qutuz's] murder, he had the city gates closed and strongly guarded so that no one could go in or out without his permission. Christians who had entered the city on pilgrimage were quite unable to leave it for a long period, but were detained there, because they would not allow anyone to leave.
>
> The Christians persevered and in the end, after much suffering, were allowed to go. As best they could and amid great dangers they returned all together to the Christians' territory by the sea. They were often attacked on the way and lost many of their people and possessions, and it was said for certain that all these attacks on them were made on orders of the emir of Jerusalem, to whom they had paid considerable sums, and by whose leave and safe-conduct they had gone to the Holy Sepulcher.[293]

Elimination of access to the holy places was of course a serious problem for not only Christian pilgrims, but also for Crusader and Muslim commerce, and it represented an ominous indication of how far Baybars and his emirs were prepared to go to punish the Crusaders.

Baybars himself was not yet interested in dealing with the Franks apart from his efforts to establish his power as sultan. Having consolidated his political and military position in Egypt and part of Syria, he also wished to have religious approbation from the caliph of Baghdad for his rule. To that end he recognized a new successor to the caliphate, a man named Abu'l Qasim Ahmad, who took the honorific title, al-Mustansir Billah, at the time of his installation as caliph of all Islam in Cairo, in June 1261.[294] Abu'l Qasim Ahmad was then sent with the important objective of wresting Baghdad, the traditional seat of the Abbasid caliphate, away from Mongol control. When he died in battle in the attempt, on 18 December 1261, one of his sons, Abu'l Abbas Ahmad, was eventually recognized as the new caliph. Taking the title al-Hakim, the new caliph was installed, again in Cairo, in November 1262, but Baghdad had still not been taken from Mongol control.[295] Cairo therefore became the seat of the caliphate and the new focus of Islam, by default. Viewed another way, Cairo was now the capital of Islam and the caliph was a court functionary of the Mamluk sultan. Hulagu and the Mongols were still a major threat to Baybars – and to the Crusaders – from the east.

In the face of major defeats at Ain Jalud (September 1260) and at Homs (December 1260), and now an open, if unsuccessful, Muslim assault on Baghdad (December 1261), the Mongols, commanded by Hulagu, meanwhile reorganized and prepared to mount a new attack on Syria. By April 1262, they were marching westward to Mosul and the Jazirah. Baybars immediately initiated a defensive scorched earth policy, ordering the grasslands to be burnt from Aleppo eastward for a distance of ten days' march toward Mesopotamia. He also mobilized and trained his troops; established a remarkable system of communications between Syria and Egypt, the *barid*;[296] and brought the independent Mamluk emirs of Kerak and of Aleppo under his control, thereby more or less completing his suzerainty over Ayyubid Syrian princes. He also proceeded to conduct a vigorous diplomatic campaign.[297]

Baybars's diplomatic activity had several goals, among which the most important were first to gain allies against the Mongols, second to protect himself against Crusader aggression, both small raids and major expeditions, and third to punish the Crusaders in the County of Tripoli and the Principality of Antioch, as well as the Armenian king, who had treated with his enemies.[298] To deal with the Mongol threat, Baybars sought the support of Bereke Khan, leader of the Golden Horde of Kipchak Mongols, and Hulagu's main opponent in the western territories controlled by the Mongols. Bereke Khan had led the only faction in the Mongol civil war following the death of Mongka to oppose Hulagu successfully, but even more importantly, he was a Muslim, the only major Mongol commander to embrace Islam at this time. Bereke Khan not only constituted a real threat to Hulagu and the Il-Khanids in Persia and northern Iraq, but also he controlled the Kipchak steppe territory, which was the primary recruiting ground of Mamluk soldiers for Baybars. In seeking other powerful allies, Baybars was characteristically ambitious, arranging amicable relations with the new Byzantine emperor, Michael VIII Palaeologus, and with the Hohenstaufen leader, Manfred, governor of Sicily, partly to learn of plans for new Crusades from the West.[299] In 1264 he even received an embassy from Manfred's enemy, Charles of Anjou, in Cairo.[300]

In regard to the Crusaders and the Armenians, Baybars had especially resented the alliance of Bohemond VI and King Hetoum with the Mongols against the Mamluks at the time of the battle of Ain Jalud. Hetoum, of course, had visited the great khan, Mongka, personally at Karakorum years before, in 1253, the first Christian ruler to do so. Like Louis IX, Hetoum had sought to enlist the khan's aid in ridding the Holy Land of Islam. Hetoum returned to Cilicia in 1256 with promises of assistance that he used to attempt to win over the support of the Crusader leaders. Only Bohemond VI was interested; Bohemond VI was, of course, married to a daughter of Hetoum, Sibylla. As long as the Mongols were victorious, the Armenians were the beneficiaries of this alliance, and Armenian soldiers fought with the Mongols in various campaigns, but after the Mongols were defeated at Ain Jalud in September 1260, the Armenians and their Crusader ally, Bohemond VI, eventually became a particular target of Baybars's wrath.[301]

In the autumn of 1261 Baybars ordered his troops to attack Aleppo and began to conduct raids in the territory of Antioch. Meanwhile Hetoum, seeing the threat of war looming ahead, attempted to negotiate with Baybars without success. The Crusaders were little more successful, because now one of their major weaknesses became glaringly apparent. Whereas during the residency of Louis IX, foreign policy was conducted by the king, after 1254 the authority of the crown was seriously fragmented and royal standing was undermined by a lack of presence. The result was that in 1261 the great lords and the military orders were conducting negotiations not only on behalf of the states of Tripoli and Antioch and the Latin Kingdom, but also on their own behalf. So when Baybars and his army arrived in Syria, representatives of the Frankish lords came to him, including delegates from the counts of Jaffa and Beirut, and from the military orders.[302] Seizing the opportunity to divide and conquer, Baybars gave all of the representatives a hard time. Although he eventually agreed to renew the truce arranged by the last Ayyubid sultan of Damascus, an-Nasir Yusuf, with the Latin Kingdom, he maintained that the Franks were not honoring its terms. Ibn al-Furat describes the complicated array of embassies, always mentioning that the Crusaders brought gifts or that they sent large presents to the sultan, but unfortunately never mentioning specifically what those gifts might have been.[303]

In the following year, 1262, Baybars conducted further operations against the northern Crusader territory, including the port of St. Simeon, which was sacked.[304] When the city of Antioch itself came under attack, Hetoum was forced to appeal to his Mongol allies. Hulagu sent a force in timely fashion, and, together with Armenian soldiers, they fought off the Mamluk assault.[305] Antioch was saved on this occasion, but it would only be a matter of time before the Mamluks attacked again. For the Crusaders the truce was viewed as, indeed it was hoped to be, a genuine protection against major Muslim invasion. For Baybars, however, so far it was simply an instrument to provide him with the opportunity to organize his troops for an effective attack in order to punish the Crusaders for their past transgressions. Muhi al-Din records that foremost among the reasons Baybars found it necessary to attack the territory of the Franks, was their repeated breaking of the terms of the truce.[306]

In 1263 Baybars returned to Syria, and once again the Crusader representatives arrived in his camp. The truce was renewed, and John of Jaffa obtained promises of an exchange of prisoners. Incredibly, however, the Templars and the Hospitallers would not give up their Muslim prisoners.[307] On the basis of this provocation, the Mamluks broke off discussions and marched into Crusader territory, where they camped outside of Tyre. In late March, as punishment for their breaking the truce, Baybars "gave orders that the church of Nazareth should be demolished, this being the most important place of worship for them; it is said that the religion of the Christians had its origin there. He sent there the emir 'Izz al-din Amir-Jandar who razed it to the ground. None of the Franks dared to come out of the gates of 'Akka and they did not utter a single word. Then he dispatched the emir Badr al-din Aidumuri with a body of troops, and they went towards 'Akka and carried out raids as far as its gates."[308] The church was completely destroyed, as the fragments of mostly broken sculpture excavated in the twentieth century attest, but the shrine of the Annunciation, the grotto of the Incarnation itself, was apparently left standing.[309] How different Baybar's brutal policy is by contrast to that of Saladin, who would not harm the Church of the Holy Sepulcher when he captured Jerusalem in 1187!

Following this operation, Baybars attacked Acre, an assault recorded in both the Noailles Continuation and the *Annales de Terre Sainte* and described at length by Muhi al-Din. On 14 and 15 April Baybars damaged the surrounds of the city: "they burned all the towers and walls which were situated in the neighbourhood of 'Akka and cut down the trees and burned the fruits, so that people saw nothing but smoke or raised dust, glittering swords, and sharp shining spearpoints. The army went to the gates of 'Akka, fighting and taking prisoners, so that within an hour a number of Frankish counts and horsemen were killed, a number were captured with their horses, and their leaders were wounded and danger encompassed them."[310] The *Annales* described the Mamluk army as numbering thirty thousand horsemen.[311] The Crusaders suffered some serious casualties, including Geoffrey de Sergines, who was wounded outside the walls.[312] Baybars decided not to press this siege – the Muslim hinterland was still too dependent on Acre economically for any drastic action – but he had served notice that he was a very serious threat.[313] Could the Crusaders meet his challenge?

That Baybars was a ferocious enemy the Crusaders were only beginning to learn, but he was also concerned to be a pious Muslim. Ten days after his attack on Acre he left Tyre and went to Jerusalem. Muhi al-Din writes: "he reached Jerusalem on Friday and visited the [Muslim] Holy Places. He and the Shaikh of the sanctuary climbed up to the dome which was on the Rock, by the outer side. He himself inspected those parts which needed repairs, and saw all himself. He went and saw these sacred places, after which he performed the Friday prayer and gave alms. He looked into the affairs of the waqfs and the registration of their revenue and expenditure. He gave written orders for the protection of the waqfs, saying also that whatever be demanded from Syria for repairs should be sent quickly."[314] The Crusader embellishment of Jerusalem had ended, and now the Mamluk phase of its artistic and architectural development began. The patronage of the Mamluk sultan initiated here in Jerusalem by Baybars, is then emulated by his successors, especially al-Nasir Muhammad, in embellishing Jerusalem with works of art, pious Muslim foundations and important Mamluk architecture.[315]

Meanwhile Baybars carefully watched Hulagu and his Mongol army to the east. He maintained the best relations with Bereke, chief of the Golden Horde in the Volga Valley, and with the Seljuk Turks of Rum, to protect his northeastern Syrian territory. In fact we have an extraordinary description of the lavish attention he gave to the envoys from Bereke in July 1263, after Baybars returned from his Syrian campaign that year. Not only did he welcome the envoys of Bereke with special Muslim honors, such as inserting the Mongol khan's name in the *khutba*, "a unique sign of diplomatic recognition,"[316] but he also sent lavish gifts to his Mongol ally as recorded by Muhi al-Din. It is worth quoting the array of presents as typical of a high-level diplomatic mission. The following special offerings were prepared:

> A Holy Qor'an, said to have been transcribed by 'Uthman ibn 'Affan (may God be pleased with him) enclosed in a case of red satin embroidered with gold, over which was a leather cover lined with striped silk, and a stand for it encrusted with carved ivory and ebony with a silver latch and a silver lock; a great quantity of finished Venetian cloth, prayer carpets and other carpets of diverse colours, coloured Levantine robes, several leather cushions, leather sheets for making tents, a large number of tables intended to hold chandeliers, Qaljuri swords with silver hilts, gilded iron clubs and others, Frankish helmets with silver collars, painted shields, lamps with Venetian shades, polished bowls for candles with shades, silver lamps with Venetian shades, a sufficient number of small saws made like spears for silver lamps, a double candlestick the base of which was wholly inlaid with metal, bridles inlaid with metal, the tops being threaded through with silver-ornamented rope, silver jackets inlaid with gold, well-ornamented cruppers, felt-covers, saddles from Khwarizm complete with cushions, Russian-leather bags threaded through with strings and silver ribbons, cross bows from Damascus with strings of silk, arbalests with their strings, arbalests made of the skins of dappled monkeys, silver-encrusted chandeliers, reeds of Qana wood with points of Arabian iron, exquisitely fashioned arrows in leather-bound boxes, stone cauldrons, large gilded lamps, banners with silver gilt chains, slaves, young kitchen girls, numerous marvelous parrots, excellent race horses, a sufficient numbers of Arab cloaks, rare Nubian dromedaries, swift beasts of burden, well-trained monkeys, a sufficient number of saddles for the dromedaries, bridles with chains, coverings for the mules, Chinese silk coverlets for the monkeys, giraffes with red-dyed and painted coverings. A large number of each kind was sent; besides these many new, rare, extraordinary and pretty things, the like of which were not to be found in the treasury of a great king, accompanied by slaves and men who would take care of these animals. All these were entrusted to the ambassadors of the sultan and he gave special attention to this, for all these gifts were in the interest of Islam.[317]

The array of objects is dazzling, meant to reflect a powerful ruler who commanded extensive resources, and we rarely have a list so complete. It is not surprising that a beautiful book and its accoutrements, in this case a Koran, for the Muslim khan would occupy the place of honor. The religious and military objects are important and expectable components of the ensemble. The objects included are fascinating, notable among which are the Frankish helmets, probably recycled diplomatic gifts or possibly even handsome captured specimans;[318] the numerous Venetian things, apparently acquired through trade; and even Chinese coverlets, acquired from commerce along the silk road. It is perhaps surprising that no Byzantine objects are clearly identifiable. We can imagine the fine metalwork for locks, chandeliers, candlesticks, swords, bowls, and lamps. Finally, the exotic birds and animals – parrots, camels, horses, mules, monkeys, giraffes – form a remarkable menagerie to serve courtly interests in sport, spectacle, and practicality. Some of the objects are, however, extremely odd, and one wonders whether the chronicler was embellishing the list somehow. In any case, these gifts, taken together with the seventy-page letter that Baybars sent to the khan, indicate the importance the Mamluk sultan attached to this embassy. Although we could expect that Louis IX would have made and received diplomatic gifts on this level, it seems perhaps less likely that the resident Crusader leaders ever saw such a lavish ensemble from Baybars.

Secure in his alliance with Bereke, Baybars could now proceed to strengthen his position in Syria, while continuing to monitor Hulagu and his Mongol army to the east. The Crusaders were apparently powerless to avert his impending attacks. The skirmishes they fought with Mamluk troops on the borders continued through 1264, but produced no important results. In January the Templars and Hospitallers captured the Castle of Ligon at Megiddo, southeast of Carmel. In June they conducted a raid down to Ascalon, during which they killed thirty Mamluks and returned with no losses themselves. Later on, in November, they also made an attack on Baisan.[319] These forays seemed to be somewhat randomly organized without any overall strategy behind them. As raids they accomplished nothing important militarily, but they did not fail to gain the notice of Baybars. He retaliated with a heavy attack on the Crusader Kingdom in the region of Caesarea.[320]

Meanwhile, on October 2, Pope Urban IV died after only three years in office, August 1261 to October 1264. As the former patriarch of Jerusalem, James Pantaleon, the new Pope Urban IV, had a strong interest in aiding the Latin Kingdom, and he knew what needed to be done. He worked with all deliberate speed to fill open positions in the Crusader hierarchy and in 1262 appointed an able man, William of Agen, to become the new patriarch. William's very appointment giving him administrative control of the see of Acre was yet another symbolic step backward, however, indicating that the goal of retaking Jerusalem was receding further and further from reality. William was also granted legatine powers in the Latin East in 1263, making him the pope's sole representative with power over both the patriarchates of Jerusalem and Antioch. William of Agen proved to be an important church leader when political leadership for the Latin Kingdom was so fragmented. With the papal backing of Urban IV, more money was raised to support the cost of the defense of the kingdom, mainly through a tithe started in 1263 and continued for five years.

The next pope, Clement IV, was elected promptly in October 1264, and he continued his predecessor's staunch support of the Latin Church in the Crusader East.[321] Unfortunately, despite his best efforts and those of patriarch William, events of the next few years, which would have a disastrous effect on the Latin Kingdom as well as the County of Tripoli and the Principality of Antioch, were triggered by a death in far-off Mongol territory.

On 8 February 1265, Hulagu, grandson of Ghengiz Khan, died. He was buried on an island in Lake Urmia, east of Tabriz. Although his devoted Nestorian chief wife, Doquz Khatun, no doubt offered Christian prayers for her husband, his burial rites were in the Mongol tribal tradition, including the last recorded human sacrifices in a funeral for a figure descended from Ghenghiz Khan: Young courtesans were interred with him and his riches in barbaric splendor.[322] With the great Hulagu now removed from power and the Mongols faced with finding a successor, Baybars could proceed with his plan to attack and ultimately eradicate the Crusaders.

The sultan had marched into Syria in January of 1265 with the ostensible purpose of protecting his northern and northeastern borders along the Euphrates from Mongol incursions. Baybars is known, however, to have made superior intelligence gathering and excellent communications a high priority during his sultanate.[323] His information must have been good about developments in Mongol territory – perhaps he had even had informants at Hulagu's last *kuriltay* near Tabriz in July 1264 – and his plans must have been long prepared. News of Hulagu's death had hardly arrived in Syria when he ordered the Mamluk army to attack not the Mongols who were no longer a threat, but the Franks. In contrast to the sporadic raids the Crusaders had marshaled against him in the past, Baybars now launched systematic campaigns each year, with devastating effect.

In 1265 Baybars's first objective was Caesarea.[324] He attacked and captured the town immediately, despite the new walls that Louis IX had built, on 27 February. Retreating to the citadel of the city, the Crusaders held out for another week. Ibn al-Furat reports:

> This citadel, known as al-Khadra (the Green), was one of the most strongly fortified and finest of its kind. For Louis had had granite pillars carried there which he had arranged with skill. No finer construction was to be seen in al-Sahil, nor any stronger or loftier, for round it was the sea whose water flowed in its moats. It could not be mined because of the granite columns used crosswise in its construction, and even were it undermined it would not fall. However, the Muslims continued to attack it, bombarding it with their mangonels. At one moment the Sultan would be shooting arrows from the top of a church[325] in front of the citadel, at another, he would mount and plunge into the sea waves to fight. Siege engines and moving towers were constructed....
>
> The Sultan remained steadfastly at the front of the fighting. He... stayed in the church with a company of crossbowmen, shooting away and preventing the Franks from climbing to the top of the citadel. At times he would go on one of the siege engines fitted with wheels, being drawn along beneath it up to the walls where he could see the saps for himself. One day, he was found with a shield in his hand and by the time he returned, there were a number of arrows stuck in it.

Eventually the garrison surrendered, on 5 March. The sultan began the work of demolition, "taking a pick-axe in his hand, he started on this work himself. Seeing him, the Muslims imitated him, setting to work themselves, while he took part in this himself with his own hands, getting a coat of dust."[326]

While this attack was in progress, Baybars sent out detachments of his men to conduct raids on Baisan and on Acre. The Crusaders did not seem to understand his strategy; Frankish sources, such as the Noailles Continuation and the *Annales de Terre Sainte*, hardly say anything about Caesarea, claiming it was taken by treason, and focus more on the attack on Acre, which was only a probing, diversionary action. Meanwhile, when the operation at Caesarea was complete, Baybars sent part of his army up to Haifa, which he captured quickly and also demolished. He personally moved up to 'Atlit with another force. The Templar castle was heavily defended, and Baybars had another objective in mind, farther south, but the sultan was able to burn the village outside the city walls at 'Atlit before his army reformed and marched southward to Arsuf.[327]

At the end of March, the Sultan appeared unexpectedly at Arsuf, which was his next real objective.[328] Here there was a sizeable force of Hospitaller knights, but Baybars was prepared for a long siege. The Hospitallers fought bravely for several weeks, but the lower town fell on 26 April. Three days later, on 29 April, the citadel surrendered. The *Annales de Terre Sainte* claims that 410 Hospitallers ["freres"] were captured along with others, and all were taken to Egypt and put in prison. Before they left, Baybars forced the prisoners to assist in demolishing the walls of the city. The sultan concluded his program at Arsuf by deeding land to the emirs who had fought with him in this campaign. Ibn al-Furat quotes the wording of the certificate and records the names of the fifty-eight emirs and three other high officials who were given conquered territory. He concludes by saying, "The back of the Franks' power was now broken, their affairs were in disarray, their endeavors frustrated, and wailing attended the herald of their destruction."[329]

The loss of these two fortresses, Caesarea and Arsuf, "horrified the Franks, and inspired the Templar troubadour, Ricaut Bonomel, to write a bitter poem complaining that Christ seemed now to be pleased by the humiliation of the Christians."[330]

Fortresses of Crusaders were indeed falling to the Mamluks, and the borders of the Latin Kingdom were shrinking; the *Gestes des Chiprois* and the Noailles Continuation report that Muslim held territory could be seen from the city of St. Jean d'Acre in 1265.[331] But Acre was still strong despite the internal disputes. Hugh of Antioch was the newly designated regent following the death of Isabel of Cyprus in 1264; he had only recently been chosen, and he arrived at the end of April with reinforcements from Cyprus when he heard news of the Mamluk invasion.[332] Baybars noted the situation when he left Arsuf on 11 May, retiring to Cairo at the completion of his campaign.

Meanwhile Louis IX faithfully continued to support the French Regiment in Acre financially, and other independently financed Crusaders also appeared. Among the latter, the celebrated knight, Eudes, count of Nevers, arrived on 20 October 1265 with his substantial supporting entourage.[333] Jonathan Riley-Smith identifies the following in his household group: four knights, nine sergeants, five crossbowmen, four turcopoles, three chaplains, eight squires, and thirty-two servants.[334] Additional prominent knights sailed with Count Eudes, for example, Erard de Valery and Erard de Nanteuil, with many other soldiers.

In the Crusader States to the north, Bohemond attempted his own military action against the Mamluks later in the year. In mid-November he assembled his men along with knights of the Templars and the Hospitallers and attempted to carry out a raid against the emir of Homs. Apparently trying to ford the Orontes, he was attacked by the Muslims before he could cross the river and driven back deep into his own territory.[335] Bohemond VI was one of the former vassals of Hulagu, who along with King Hetoum of Armenia had attended the last *kuriltay* of the Mongol khan in 1264. Baybars was anxious to deal with him because of what he viewed as Bohemond's treacherous ties to the Mongols, but he was even more intent on dealing with Hetoum, who was allied even more strongly with the Mongols.

The year 1265 had been a good one for Baybars, one in which he had seen his greatest threat removed, in the person of the Mongol khan, Hulagu. Accusing the Franks of breaking their truce, he had also begun serious military action against them. With a series of remarkable victories, the Mamluks had taken Caesarea, Haifa, and Arsuf, thereby isolating the Crusader enclaves of Jaffa and 'Atlit from Acre along the southern coast of the Latin Kingdom. The following year, 1266, would provide him with additional successes against the Latin Kingdom, Tripoli, and also Cilician Armenia. Now pursuing a policy of yearly campaigns against the Crusader States, the sultan prepared his soldiers to march into Syria again.

During the winter of 1265–6, Baybars observed the Mongols occupied by a struggle for power between Bereke and Hulagu's designated successor, his son Abaga. With the Mongols neutralized on his northern and northeastern Syrian borders, his attention turned to the campaign against the Crusaders and their allies, the Armenians. After the rainy season the sultan divided his troops into two sections for his next assault. In June 1266 Baybars, personally leading one army, arrived in the Latin Kingdom. Continuing his practice of keeping pressure on the Crusader capital, he again appeared outside of Acre. After assessing his options, verifying Crusader strength at Acre, recently reinforced, and forcing the Crusaders to maintain a strong garrison there, his army then threatened Montfort, the headquarters of the Teutonic Knights in the hills a few miles east and a little northeast of Acre. His real target was, however, the enormous Templar fortress of Safed, due east of Montfort, which had been rebuilt starting in 1240.[336] After twenty years of work, Benedict of Alignan, the pilgrim bishop who had inspired its reconstruction, returned to Palestine in 1260 to see it standing heavily fortified with formidable outer works including ditches and seven major towers.[337] It also featured a centralized church, which like that at Chastel Pelerin ('Atlit) was possibly built as a response to the loss of the Templar headquarters in Jerusalem and the Templum Domini.[338] This church was said to be a domed octagon with niches. In the tower of the citadel there was also the statue of St. George, reported by Ibn al-Furat. This was the castle that Baybars now attacked forcefully, repeatedly, on July 7, July 13, and July 19. After these assaults he offered amnesty to the native local troops, but not to the Templars. Some of the native troops began to desert. Eventually the Templars attempted to arrange a surrender with the guarantee of a safe passage out to the coast. When Safed was turned over to the Mamluks, however, Baybars claimed the Templars had broken the terms of the treaty, and therefore they were condemned to die. All but two were decapitated. It was a chilling reminder of what a fierce enemy the Crusaders faced in the person of this Mamluk sultan.[339]

The conquest of the large and important castle at Safed enabled Baybars effectively to take control of Galilee. His troops did not demolish Safed the way they dealt with other captured castles, but instead he provisioned and equipped it and installed a large garrison there. "At this time, the Sultan went up to the citadel to pray in the tower.... There he saw a large idol of which the Franks had been used to say that the citadel was under its protection – they had called it Abu Jurj (George). He ordered that it should be torn out and smashed, and the place was purified of it, its site being turned into a mihrab."[340] Thereafter, late in July, he took Toron quite easily along with Hunin, two smaller castles just north of Safed, leaving the Litani river valley open to the Mamluks. Eventually he also attacked and destroyed the Christian village of Qara, a Syrian city to the east between Homs and Damascus, north of the Monastery of Saidnaya. Word was that Muslims were being captured at Qara and sold as slaves by the Crusaders.[341] Apparently because of his destruction, few fragments of local Christian fresco painting from this period survive in Qara.[342]

Meanwhile, the Armenian king, Hetoum, fearing an assault, had gone to Tabriz to enlist Mongol aid, but he was too late. While he was gone, the Mamluks attacked. The second Mamluk army, commanded by Kalavun and including the troops of al-Mansur of Hama, left Homs and at first marched eastward, toward Tripoli, taking several towns including Arqa, before turning north. Bypassing the Templars at Baghras and the main Armenian force led by the sons of Hetoum, Leo and Thoros, in the south at the Syrian Gates, the Mamluks entered Cilicia farther north by crossing the mountains through the Amanus gates just north of Sarvantikar. Marching into the Cilician plain, a major battle was fought on 24 August. The outnumbered Armenians led by the constable of the kingdom, Sempad, were overwhelmed; Thoros was killed, and Leo was taken prisoner. Thereafter the kingdom was pillaged and destroyed. Kalavun sacked the main cities in the south, including Tarsus; al-Mansur marched northward to the capital city: "Sis and its chief church were given to the flames, the tombs of the kings and princes violated, and their bones torn from this last resting place, burned, and scattered as ashes to the winds."[343] For more than three weeks the Muslims wreaked havoc on Cilicia unopposed. When Hetoum finally did arrive late in September, accompanied by a detachment of Mongol troops, his heir was captive, his capital was in ruins, and the whole country was devastated. Eventually Hetoum was able to liberate Leo from the Mamluks, but only with major concessions and some complicated diplomacy.[344] With this victorious campaign, Baybars eliminated the Cilician kingdom as a political and military factor for the duration of the Crusader period.

After these major operations, the Mamluks actually tried to mount an assault on Antioch in the fall, but without success. Antioch, along with Tripoli and Acre, were ultimately the major objectives for Baybars. It would only be a matter of time before Baybars would regroup and prepare his forces to attack Antioch again. In the face of these losses, the Crusaders attempted a retaliatory attack against the Mamluks in October. The regent, Hugh of Antioch, assembled a force of Hospitallers, Templars, and Teutonic Knights, which, along with the French regiment, invaded Galilee marching by way of Tiberias, but apparently with a counterattack on Safed as their goal. The Mamluk garrison at Safed defeated the vanguard of these troops on 28 October and the main army was forced to retreat with heavy losses. This action demonstrated that the Crusaders seemed increasingly powerless to mount a serious attack on Baybars and his Mamluk army reinforced by local Arab troops. Meanwhile in August, Eudes, count of Nevers, died; his tomb became an important shrine. At the end of the year the Crusaders also suffered the loss of one of their most important local barons. John of Ibelin, lord of Jaffa, died in December 1266. He is best-known for having written the *Livre des Assises* in the 1260s, a major treatise on the laws and customs of the Latin Kingdom of Jerusalem, but he had also served as regent and was related by marriage to John of Joinville, who admired him for "his wisdom, courage and foresight."[345] The Crusaders could ill afford to lose leaders of this stature as Baybars was increasing the pressure on the Crusader States.[346]

Baybars had once again scored major victories during the 1266 campaign, which included taking control of Galilee; conquering the central part of the County of Tripoli and thereby separating Crac des Chevaliers, Chastel Blanc, and Tortosa from the city of Tripoli; and removing the kingdom of Cilicia as a political and military factor in the region. His only major problem was beyond his control. His Mongol ally, Bereke, died late in 1266, leaving Hulagu's successor, Abaga, again as a threat to the northeast. Baybar's reaction was to prepare his army to return immediately to the attack in order not to lose the momentum he had gained. Unfortunately for the Crusaders, 1267 provided Baybars with time to prepare for his next major attacks on the Crusader States, and the campaign of 1268 would make it one of his most successful expeditions against them.

Before the Mamluks could continue operations against the Crusaders, they had to secure their northern border in Syria. In March of 1267, Abaga and his Mongol army appeared at al-Bira, the modern Birejik, on the Euphrates River. Baybars marched his army into Syria to make a show of force and the Mongols withdrew. In April he then moved to Safed and established his camp. There the Mamluks continued the rebuilding and fortification of the castle to make it a major garrison for operations against the Crusaders. Farther south Baybars also ordered the walls of Arsuf rebuilt, and Qaqun, southeast of Caesarea, was fortified, both to serve as Mamluk bases.[347] By May Baybars was ready to conduct a raid on Acre. Using Templar and Hospitaller banners he had captured at Arsuf and Safed in previous campaigns, he marched on the capital city. Disguised by the Crusader banners, his army was nearly able to reach the walls undetected, but when the ruse was discovered the Crusaders successfully fought them off. Frustrated by this repulse, in mid-May the Mamluks ravaged the environs of Acre.[348] Baybars "scorched-earth" policy of devastation was one of his most effective weapons in terms of both strategic and psychological warfare.

It must have been about this time that Baybars also marched to Tripoli. For this Maqrizi reports that Baybars "marched on Tripoli and installed his camp in front of the city.... He began the battle against the inhabitants, and captured a fort which was located at this place. He massacred the Franks inside it. The soldiers hurled themselves at the people in the mountains and captured enormous booty. They put numerous defenders to the sword, and brought the booty and the prisoners before the sultan. The sultan ordered the prisoners to be killed, the trees to be cut down, the churches to be destroyed, and the booty to be divided up among his soldiers." This passage has been largely overlooked, but H. Salamé-Sarkis believes this refers to the fact that Baybars conquered the major castle of Mont Pelerin, or Qal'at Sanjil, located in the hills about three miles inland from the walled city of Tripoli on the coast, during 1267, that is, twenty-two years before the city of Tripoli would eventually fall to his successor.[349]

Meanwhile Baybars was actively conducting diplomatic relations with various Crusader groups separately, which demonstrated a dangerous fragmentation among the Crusaders that enabled him to pursue a damaging policy of "divide and conquer." In the spring and summer he made separate treaties with Philip of Montfort at Tyre, the lord of Beirut, and the Hospitallers. The Hospitallers had been negotiating with the sultan since 1266, but the recent destruction of their mill at Recordane outside Acre had apparently spurred them to finalize an agreement. The terms of the Hospitaller truce survive in detail, which gives us a remarkable glimpse of the entanglements that Baybars was skillfully constructing. The main area with which this truce was concerned was located to the north of Acre; it stretched from the Syrian towns of Homs, Shayzar, and Hama on the Orontes River to the west where the Hospitaller castle of Crac des Chevaliers commanded access to the coast. The surprising feature of this truce was that the Hospitallers and the Mamluk sultan agreed to hold this territory as condominium land, which meant that revenues from this land would be shared equally, implying also that they would share sovereignty. The truce has thirty-four detailed clauses and states that "it shall not be abrogated by the death of either party, nor by the death of a king or master until the end of the said period, viz. ten years, ten months, ten days and ten hours beginning on this day."[350] The Hospitallers entered here into a truce as a separate Crusader entity on an equal basis with the sultan, thus giving the sultan leverage to regulate this diplomatic arrangement as he saw fit, along with other such arrangements with other Crusaders.

It is a further commentary on the disorganized state of the Latin Kingdom that after the Mamluk raid on Acre, the residual hostility between the Genoese and the Venetians flared out into open conflict once again. On 17 August a Genoese fleet attempted to capture the harbor at Acre, and for approximately two weeks there was fighting in the city with substantial damage. The stables of the Hospitallers were even burned down. In the midst of the conflict the Genoese commander took half of his ships to Tyre for repairs and reinforcements. Unfortunately for the Genoese, during the interim a strong Venetian fleet arrived at Acre, destroying a number of the remaining Genoese ships and forcing the rest of their fleet to flee back to their base at Tyre.[351]

Baybars observed these developments in the Latin Kingdom as he made plans for 1268. Before he left Syria to return to Cairo he was content to inspect his newly reconstructed castles and their garrisons at Safed in Galilee, and along the coast south of Acre, at Qaqun and Arsuf, moving through these former Crusader territories at will. The year 1267 had seen no improvement in the Crusader military or political situation, and the Italian maritime cities were still resorting to open conflict on occasion, proving that although the War of St. Sabas was over in Acre, the issues underlying that war were still not solved in the larger Mediterranean world. From the Crusader point of view, at least Baybars had been repulsed making his third raid on Acre in as many years and had otherwise not attempted any major incursions on their territory. There were other, more hopeful developments as well. Amazingly Louis IX had once again taken the Cross on 24 March 1267, as the pope proclaimed a new Crusade, and preparations got underway in France. On 5 December, King Hugh II of Cyprus had died at age fourteen. As a result, the regent, Hugh of Antioch, took the throne.[352] On Christmas Day he was crowned Hugh III in Nicosia in the Church of St. Sophia. As the new king, Hugh III could assert his claim to be the active regent for the absentee Hohenstaufen, Conradin. How successful would he be? And what plans did Baybars have in store for future campaigns? The answers to these questions would be not long in coming.

The year 1268 opened for the Crusaders on an ominous note. In March Baybars marched into the Latin Kingdom from the south and launched a powerful attack on Jaffa. Jaffa was the only fortified Crusader position left south of 'Atlit and Acre itself, the home of the recently deceased John of Jaffa whom the Muslims had treated with respect. In Baybar's eyes, the truce that he had concluded with John of Jaffa did not extend to his son Guy. On 7 March the Mamluks unleashed their assault. The Crusaders were unprepared to fight and capitulated after a day's fighting with heavy casualties. The surviving garrison was, however, allowed safe passage to Acre. The citadel, recently rebuilt by Louis IX, was demolished.[353]

As part of the spoils of the battle at Jaffa, Baybars reportedly captured a relic of the head of St. George, which he apparently preserved, but he burned the body of St. Christine. Subsequently Baybars destroyed the castle, and certain spoils were said to have been sent to Cairo for the great new mosque that Baybars was building there.[354] This marks the first time we note the spoils of battle being transported to the Egyptian capital to be used for architectural construction.[355] The Crusader materials brought from Jaffa are not today identifiable on what remains of Baybars's mosque, but later buildings contain what are other earlier extant works from as yet unidentified Crusader sources. See, for example, the reliefs, probably dating from the twelfth century, placed on the entrance to the mosque, madrasah, and tomb of sultan Hasan[356] (Fig. 121, Chapter 5). Later we will also see that whole portions of Crusader buildings would be installed as trophies in Cairo as well.

From Jaffa, Baybars bypassed Acre and swiftly marched into Galilee. Due north of his fortifications at Safed and Toron, he targeted the castle of Beaufort. Beaufort, manned by the Templars, is located high on the ridge above the right bank of the Litani River, overlooking the valley. Because of its formidable natural site, Beaufort was difficult to attack directly, but Baybars launched his assault with siege engines, and after only ten days, on 15 April, the garrison surrendered. The women and children were allowed safe passage to Tyre, but the men were taken prisoner to serve as slaves. Like Safed and Toron, Beaufort was rebuilt and given a strong garrison of Mamluk soldiers.[357]

With these lightning strikes, Baybars had the Crusaders reeling and fearful of what might be next, they prepared for the worst. The fall of Beaufort left Tyre and Sidon open and vulnerable to attack. King Hugh III came quickly from Cyprus to organize the defense of Acre on 22 April. Baybars, however, always effectively using the element of surprise, moved quickly to a position outside Tripoli on 1 May. The Templars, having lost Beaufort, sent envoys to deflect the Mamluk army from their fortifications at Tortosa and Chastel Blanc [Safita]. Baybars ravaged the countryside around Tripoli for several days. Ibn al-Furat comments: "[Tripoli] used to resemble Damascus with its orchards, but its trees were cut down by Sultan Baibars in this year."[358] Seeing Bohemond VI was prepared for battle, the Mamluks suddenly marched away without anyone knowing in which direction they were headed. On 14 May Baybars appeared beneath the walls of Antioch.

With Bohemond VI in Tripoli, the defense of Antioch was led by Simon Mansel, his constable. Mansel led an expedition outside the walls on the first day and was captured by the Mamluks. He agreed to attempt to arrange a surrender of the city, so Baybars released him, holding his son as hostage. Mansel honorably made the case for surrender, but none of the Antiochenes would listen. Ibn al-Furat says, "they showed strength of mind was well as fear of their master, the Prince (Bohemond VI)." When no surrender was forthcoming, Baybars announced that his army was going to attack. Ibn al-Furat succinctly describes what happened:

> The troops surrounded the whole city and the citadel. The people of Antioch fought fiercely, but the Muslims scaled the walls by the mountain (Mt. Silpius) near the citadel and came down into the city. The people fled to the citadel, and the Muslim troops started to plunder, kill and take prisoners. Every man in the city was put to the sword – they numbered more than a hundred thousand.

Several thousand soldiers along with women and children were left in the citadel. A day after the city had fallen, they asked Baybars to spare their lives and let them be taken as prisoners. On Sunday, 20 May, Antioch surrendered to Baybars amid much carnage and a huge amount of booty.[359]

The fall of Antioch was a terrible blow to the Crusaders. Antioch had been taken in June 1098, some 170 years before, and had symbolized for the First Crusaders that the will of God was with them en route to Jerusalem. The principality of Antioch served as a Crusader bulwark against the Seljuk Turks, and it was a perpetual demonstration of Crusader defiance against the Byzantines who claimed it as their own. To this point Antioch had been one of the greatest cities in the eastern Mediterranean, but after its capture by the Muslims, it lost its importance militarily, politically, ecclesiastically, and commercially. Ibn al-Furat records a letter, remarkable for its irony, that he says Baybars sent to Bohemond VI explaining the situation as he saw it and as he wanted Bohemond to see it and clarifying much about Baybars's point of view:

> To the great Count Bohemond, whose title has been altered by his loss of Antioch from that of Prince to that of Count – may God inspire him to follow the right course, turn his purposes to good and cause him to remember His admonition. The Count knows what happened when we marched on Tripoli and attacked him in the middle of his own land. He knows what he saw after we left – the devastation..., the destruction..., how the men were killed, the children enslaved and the freeborn women taken as slaves, how the trees were cut and nothing left except what may serve – if God wills – as wood for mangonels.... You know how we left you – leaving only to return and postponing your fate.... You know how we rode off and left you and no news went ahead of us to your city of Antioch; we came there while you did not believe that we were far from you and (you thought) that even if we had gone we would presently return again.
>
> Now we tell you of what is accomplished and let you know of your all-embracing disaster. We marched away from you, leaving Tripoli on Wednesday, the 24th of Sha'ban (9 May), and encamped at Antioch on the first day of the month of Ramadan (15 May). As soon as we camped there, your army came out to challenge us to battle. There were defeated.... From amongst them the Constable (Simon Mansel) was captured. He asked to be allowed to consult your companions;.... They spoke with us, but we saw that they followed your counsel.... When we saw that they had lost their chance of escape and that God had decreed their death, we sent them back and said: "This hour we shall press the siege against you. This is the first warning and the last." So they returned, in imitation of your own behaviour, believing that you would come to them with your horse and your foot. Then.... Death came on them from all quarters. We took the city by the sword on the fourth hour of Satuday, the 4th of the month of Ramadan (19 May).... If you had seen your churches with their crosses broken and rent, the pages from the false Testaments scattered, the graves of the patriarchs rifled, your Muslim enemy trampling down the sanctuary;... had you seen these things, you would have said: "Would that I were dust. Would that no message had come to give me news of these things."
>
> This letter, then, gives you good news of the safety and prolongation of life that God has granted to you because you were not staying at Antioch at this time and you did not happen to be there. For (otherwise) you have been killed or captured, wounded or broken.... Perhaps God has granted you a delay only that you may make up for your past lack of obedience and service. Since no one escaped to tell you of what has happened, we have told you ourselves, and as there is no one who can give you the good tidings of your own safety and of the loss of the lives of the others, we have given you this account... of what has happened. After receiving this letter you should not disbelieve any information that we give you, and after what we have told you in our address, you need ask no informant to give you any other news.

According to ibn al-Furat, when this letter reached Bohemond, "he fell into a violent rage, as he had not heard the news about the city from any other source."[360] In contrast to this expansive account, the Crusader sources basically only report the event of this terrible catastrophe without comment. The *Annales de Terre Sainte* states tersely: "à xi jors de may, prist Bendocdar la cité d'Antioche." No Crusader chronicle contests this Muslim account of the fall of Antioch, and the helplessness that Bohemond was obviously meant to feel at the hands of Baybars must have been a bitter pill for him to swallow, but one he could do nothing about.

The impact of the loss of Antioch sent shock waves through the Crusader States and all over Europe. Not only was Antioch lost, but almost all the castles in the principality. Even the Templars, seeing they could no longer hold their position at Gaston (Baghras), withdrew southward to safety. The port of St. Simeon was now in Mamluk hands. The only pieces of the principality that survived were the isolated port city of Latakia on the coast, the large patriarchal castle of Qusair (Cursat) just south of Antioch, and Roche Roussel, a Templar castle far to the north. Fortunately for the Crusaders, Baybars paused after his great conquest at Antioch and allowed the Crusader regent, Hugh, to send envoys seeking a truce; Bohemond asked to be included. Both Hugh and Bohemond were no doubt grateful when Baybars granted them a cessation of hostilities for one year.[361]

Hugh of Antioch as regent was now in a difficult position. With the deaths of his mother, Isabella, and the youthful Hugh II in 1267, he had claimed the right to exercise Hugh II's regency for Conradin in Jerusalem against Hugh of Brienne, and eventually had won it, although Hugh of Brienne did not relinquish his claim.[362] Hugh of Antioch seems to have won it by showing his leadership in defending the Latin Kingdom when the need arose in 1265 and 1266, while serving then as regent for Hugh II while his mother was alive. He showed his mettle again in coming to Acre to take command as king of Cyprus in May 1268, organizing the defense of the city against Baybars on one hand and trying to defuse the fighting between the Venetians and the Genoese on the other. But his claim as regent for Conradin was also contested by Maria of Antioch.[363] Now his position as king of Cyprus and the military aid he could and did provide won the High Court to his side, even though technically, Maria's claim was stronger by virtue of relationship.

For Hugh to succeed he needed supporters and allies among the barons. His one reliable officer, Geoffrey of Sergines, had fallen seriously ill and eventually died in the spring of 1269. John of Arsur, the last of the important Ibelin barons, after John of Beirut (†1264) and John of Jaffa (†1266), died in 1268; the only Ibelin left with a major holding was Isabella of Beirut. Eventually Hugh sought to solidify his ties with the Ibelins by marrying Isabella of Brienne, daughter of Guy, the constable of Cyprus.[364] Hugh's further opportunity arose with the death of Conradin in far-off Sicily.[365]

On 29 October 1268, Conrad V, known as Conradin, the last legitimate descendent of Frederick II and Queen Isabel of Jerusalem, was beheaded in Naples at the order of Charles of Anjou. As a result forty-three years of Hohenstaufen – mostly absentee – claims to the crown of Jerusalem were now over. When the news of Conradin's violent death reached the Latin Kingdom, the Templar of Tyre reports that there was great rejoicing in Acre.[366] No doubt while the smoke of the fireworks was still in the air, Hugh claimed the throne as former regent and heir presumptive, but Maria of Antioch would not relinquish her claim. She persisted, with Templar support, despite being turned down by the High Court. After the coronation of Hugh III at Tyre on 24 September 1269 by the bishop of Lydda, acting for the patriarch, Maria registered a formal protest. She then sailed off to Rome to lay her claim before the pope as well. Eventually her case was allowed to be heard at the Council of Lyon in 1274, and ultimately in 1277, with papal assistance, she sold her claim to Charles of Anjou.[367]

With Hugh III as the resident king of Jerusalem and Cyprus, the Crusaders at least had the hope of an effective new leader to guide them in their struggle against Baybars and the Mamluks. Even with the new Crusade proclaimed in 1267, however, the question would be, could Hugh III reestablish internal unity to the Latin Kingdom? As Edbury states it, could "he be king of the entire realm, and not simply 'king of Acre' as Muslim writers called him . . . ?" Could he find a way to control the barons and the High Court, the military orders, and the Italian communes? In the respite offered by the truce with Baybars following the fall of Antioch in May 1268, the answers to these questions could only be guessed at. The future of the Latin Kingdom of Jerusalem was very much in doubt, but at least there was a king of Jerusalem and a new Crusade on the horizon.

CONCLUSIONS

In the period 1244 to 1268 there can be no doubt that the Latin Kingdom of Jerusalem underwent massive changes. Although terrible defeats were inflicted on the Crusaders in 1244, 1250, and in 1268, the presence of Louis IX in the Holy Land, in residence from 1250–4, had produced extremely positive results for the Latin Kingdom. After his departure, however, the shrinkage of the Latin East began in earnest in the 1260s with the loss of Constantinople and much of Frankish Greece and the rise of the sultan Baybars with his relentless campaigns in Syria-Palestine. In the Holy Land we can clearly see the pivotal shift from an offensive to a defensive posture on the part of the Crusaders after Louis IX returned to France. With the War of St. Sabas, fought openly among the Italian maritime communes, the kingdom was seriously weakened, its constituents dangerously fragmented. The frontiers of the Latin Kingdom began to shrink precipitously starting in 1265 in the face of repeated and persistent Mamluk campaigns aimed at major Crusader positions in the Latin Kingdom, the County of Tripoli, and the Principality of Antioch.

In view of the complicated and difficult political, economic, and military situation in the Crusader States between 1244 and 1268, where did things stand in this period with regard to the art and architecture? How had the important military defeats of 1244, 1250, and 1268 affected Crusader artistic developments? What impact did Louis IX have on the art and architecture of the Latin Kingdom during his four-year stay? What implications did the War of St. Sabas have for the patronage of artistic and architectural work in the Latin Kingdom in the late 1250s and 1260s? What threat did Baybars pose for the art and architecture of the Crusader States in mainland Syria-Palestine? Finally, what other aspects relevant to artistic development can be discerned from an examination of the historical record of the Crusader States in this period?

In regard to the major defeats that the Crusaders suffered in this period, they all had a serious negative effect on the development of Crusader art. Briefly stated, the Battle of La Forbie following the Khwarismian conquest of Jerusalem meant that the Holy City was now firmly in the possession of the Muslims. When the sultan Baybars later seized control in Cairo, this translated into the beginnings of active Mamluk patronage in Jerusalem, meant gradually to supercede what work the Crusaders had done there and to give it the stamp of a Muslim holy city, the third most holy site in Islam.

When Antioch was taken, we have seen from the accounts in Muslim sources what tremendous destruction was wreaked on the city and what vast booty was seized by the Mamluk army. The devastated condition of Christian monuments of Antioch as seen today apparently can be substantially traced back to the Mamluk conquest of 1268 and subsequent deterioration under Ottoman rule.

The one great positive contribution to the well-being of the Crusader States, and especially the Latin Kingdom, had of course been the residency of King Louis IX between 1250 and 1254. A number of important developments can be associated with his presence and patronage. Some are quite direct and specific. Louis IX was instrumental in sponsoring and constructing a major series of fortifications in the Latin Kingdom, at Acre, Caesarea, Haifa, Jaffa, and Sidon. He was, in other words, a truly major contributor to the defense of the realm, who spent more money on the military architecture of the Latin Kingdom than any other Crusader. Money for the Latin Kingdom was coming not only from church tithes for the Crusade, but also from his royal treasury. Men were coming to the Holy Land paid for by him, and along with those who came on the expedition of 1248–50, Louis IX also committed himself to sponsor a major contingent of soldiers, the French Regiment, to help protect the kingdom, and especially the capital city of Acre.

It is especially because of Louis IX that we also learn of another aspect bearing on the arts, which is of great importance. When Louis IX was in the Near East he engaged in vigorous diplomatic activity, interacting with a staggering array of diverse figures of great importance on the world stage. These people included, obviously and conspicuously, the Muslim sultans in Syria and Egypt, the Mongol khan, and the Latin Emperor in the East, among others, and, in the West, the pope, Frederick II, and other crowned heads of Europe. What we learn from the sources about these diplomatic activities is that ambassadorial missions normally included major gifts, and for an important mission to an important ruler, a major work of art might function as the centerpiece of these gifts. We have noted the gifts Louis IX sent to the Mongol khan, the gifts that Baybars sent to Bereke, the gift of the pallio that formed part of the Genoese treaty with the Byzantines in 1261. These examples show us the importance of these gifts, and indicate that we must be alert for their presence and function, as well as for the means of their production, throughout this period.

As part of Louis IX's presence in the Latin Kingdom, we are constantly impressed with the activity surrounding him at his court, wherever he was resident. It is significant, however, that he established his chancery and started his political, financial, religious, and diplomatic activities in Acre, which was the Crusader city best endowed with resources to provide him with the scribes and illuminators that he was accustomed to use to execute his commissions. Although Louis could not have drawn on the same artistic resources in Acre in the early 1250s as he had in Paris in the 1240s, he certainly must have stimulated vigorous artistic activity and, over the four years of his residency, drawn talent not only from local sources in Acre, and the Latin Kingdom, but also possibly from St. Catherine's Monastery on Mount Sinai, from Constantinople, and from Cyprus, as well as Paris. If we estimate the king's needs based on his normal religious activity, and indicators such as the holdings of a major French count, such as Eudes de Nevers, Louis IX must have commissioned many manuscripts, with a number of them illustrated in Acre, for which he not only would have sponsored his own chancery and royal workshop, but also work of other, independent religious and possibly secular workshops as well.

Louis IX's religious dedication to the cause of the Crusade is a major and obvious feature of his activity in the Holy Land. His devout concern for the holy places, for observance of his own personal penance, for prayer and liturgy and the necessary accoutrements for praying and celebrating the Mass are a matter of record in all of the accounts of his personal life, in particular the account by John of Joinville on which we have relied most heavily. The fervor of Louis's religious ardor can be felt in the moral decisions he made, the policies he followed, the way he prayed for and participated in the Crusade, and his efforts to aid the Holy Land. He supported the change in coinage generated by the papal legate's complaints to the pope, resulting in a new Christian bezant. He sought to send forth the good news of Christ in his diplomatic gifts, hoping to win new converts for Christ among the Muslims. We may wonder what impressive works with religious content, if any, he sent to the Muslim sultans.

Finally, with Louis IX, we can see how he changed the posture and the nature of Acre as the Crusader capital politically, and we can expect to see some of the same changes artistically. Just as a new specifically French element was added to the Crusader presence by means of Louis IX, his Crusaders, and their activities in the Latin Kingdom, we can expect to see a new strong French link in the art, be it architecture, painting, sculpture, or metalwork. It remains to be seen just what configuration this new French element will take, but its strength and identity should not be in doubt. In fact, because of Louis IX, we can expect that what we identify as Crusader about the art of the Crusaders in the Latin Kingdom will change in the 1250s.

Following the four productive and stimulating years that the Latin Kingdom enjoyed with the presence of Louis IX to lead and strengthen the realm, it was unfortunate politically and economically for the Crusader States that affairs degenerated after his departure into a microcosm of the struggle being waged in the Mediterranean world by the Italian communes for commercial supremacy. In particular the War of St. Sabas and its aftermath left the Crusader States damaged physically, fragmented politically, and diminished economically. But the fact is that the prominence of these Italian maritime powers and the important role they played in the major Crusader ports, especially Acre, seemed to have an important stimulative effect on the artistic development of the Latin Kingdom that could not otherwise have been predicted in the face of the violence and destruction from their struggles. In this regard it is significant that the War of St. Sabas was won by the Venetians and the Pisans over the Genoese just at the time that panel painting in Italy was reaching a new and important level of production during the dugento. We shall see it is no surprise that the major artistic works of panel painting associated with Acre in the 1250s and 1260s reflect Tuscan, in this case mainly Pisan, and Venetian influence, but not Genoese traditions. We shall also not be surprised to find that during the serious fragmentation caused by the War of St. Sabas and its aftermath, Acre grows in importance as the heart of the kingdom and major Crusader center, with other significant cities growing less important, cities such as Tyre, Tripoli, and of course Antioch, which is eliminated as a Crusader capital.

The competition among the Italian communes never really ended, but the level of hostilities was significantly reduced in the Holy Land after the War of St. Sabas was fought in 1256–8, except for occasional flareups, such as that of 1267. What forced the Crusaders to pay more attention was, of course, the most serious threat to the Crusader States since the time of Saladin, in the person of the sultan Baybars and his Mamluk military forces. Baybars not only was a formidable adversary and a dominating – one can say even ruthless – military presence, but he also was supremely ambitious and motivated to exalt Islam and eliminate the Franks from Syria-Palestine. With this policy, his effect on the art of the Crusaders was not surprisingly mostly negative. He captured and demolished a whole series of major Crusader fortifications, some of which, including Caesarea, Jaffa, Arsur, Safed, had been erected by major figures such as Louis IX or Richard I or had been sponsored by major Crusaders such as Benedict of Alignan and his Templar associates. In a very few cases, the Crusaders would be able to recover these sites and rebuild them. In most cases, the Mamluks rebuilt them. This leads to an important consideration and indeed a major problem: How do we distinguish Crusader work, that is, Crusader design, masonry, and architectural techniques and materials, from Mamluk work in Syria-Palestine? A major effort to address this problem has been made in Jerusalem with the study of Mamluk Jerusalem by Michael Burgoyne and the architectural survey he conducted with other architects sponsored by the British School of Archaeology.[368] A similar effort is needed to understand how we can distinguish Mamluk work at major Crusader castles as well. A start has been made at Crac des Chevaliers, for example, but what about the many other fortifications rebuilt by the Mamluks and then later by the Ottomans? What, for example, are we looking at when we look at the current remains of the fortifications at Caesarea, said to have been constructed by Louis IX but also said to have been demolished by Baybars with the intention of making them unusable for the Crusaders?

Baybars for the most part focused his attention on military targets, but his interpretation of a military target extended to churches at strategic sites, and his destruction at Nazareth and Antioch was devastating. Only the excavations at Nazareth have yielded indications of the outstanding Crusader sculpture that was prepared for the Church of the Annunciation in the twelfth century, but mostly damaged when the church was destroyed in 1263. Excavations are needed at Antioch to attempt to find some of the major Christian buildings after the demolishments of 1268, and also later damage from earthquakes. As indicated earlier, however, it was also Baybars who identifiably started the active reuse of Crusader spolia in Mamluk Cairo, with his appropriation of materials from Jaffa for use in the new mosque he was building in the Egyptian capital starting in 1266.

In sum, it was obviously King Louis IX who had the most beneficial effect on the Latin Kingdom during this period. It was obviously Sultan Baybars who had the most negative effect. But in all cases, art was an important factor and played a major role. What is perhaps most surprising to note is that even the historical record suggests what extant artwork will demonstrate in the following section, namely, that the period of the 1250s and the 1260s was a much more active period for the art of the Crusaders than any other time after 1187. What irony that as the Crusader States go on the defensive and begin to shrink precipitously, artistic activity seems to expand and develop. What a paradox that major Crusader works of art are commissioned in a period that ends with a situation in which the days of the Crusaders in the Holy Land are numbered because of Baybars as the Mamluk sultan in Cairo.

THE ART OF THE CRUSADERS IN THE LATIN KINGDOM: *C.*1244–*C.*1268

Precíouse chose et digne est de plorer le trespassement de ce saint prince, qui si saintement et loialment garda son royaume, et qui tant de bèles aumosnes y fist, et qui tant de biaus establissemens y mist. Et ainsi comme l'escrivains qui a fait son livre, qui l'enlumine d'or et d'azur, enlumina lidiz roys son royaume de belles abaïes que il y fist, et de la grant quantitei de maisons Dieu et de maisons des Preescheours, des Cordeliers et des autres religions.

Jean, sire de Joinville

It is a pious duty, and a fitting one, to weep for the death of this saintly prince, who ruled his kingdom and kept guard over it so righteously and loyally, who was so generous in giving alms there, and who established there so many noble foundations. And as the scribe who, when producing a manuscript, illuminates it with gold and azure, so did our king illuminate his realm with the many fine abbeys he built there, the great number of hospitals, and the houses for [Dominicans], Franciscans, and other religious orders.

Jean, sire de Joinville

INTRODUCTION

The historical narrative of the developments in the Holy Land combined with the story of Louis IX's Crusade and residency in the Latin Kingdom raises a series of important issues related to the art and architecture produced for and by the Crusaders in this period.

1. Between 1250 and the late 1260s, considerable architectural work was carried out, as I have noted earlier in the chapter. Some of it involved new castle architecture on the largest scale at two of the biggest sites, Crac des Chevaliers and Safed, as well as smaller projects such as the one at Sidon. A great deal of the work was devoted to rebuilding city fortifications, at Acre, Caesarea, Haifa, Jaffa, and Sidon. The question arises again, however, of just how to identify the work done in this period in light of the heavy destruction wreaked by Baybars and other Mamluks after him. What, if anything, can be seen that is from this period in particular, other than what we have extant fragmentarily in Acre and at Caesarea? What are the important written sources that pertain to architectural work in this period?
2. When considering the patrons who were active in this period, there is no doubt that King Louis IX is the primary focus of attention. How active was he in commissioning and shaping architectural and artistic work during this period? What were his special concerns? What impact did his patronage have? Who else among the resident Crusaders or among the members of Louis's Crusade and other newcomers were active patrons as well?
3. Acre resumed its role as capital of the kingdom, both as the site of the high court and the residence of the *bailli*, in addition to the fact that Louis IX lived there for the first part of his residency in the Crusader States, from May 1250 to April 1251. Acre was disturbed, however, by significant turmoil among the Italian maritime powers after Louis's departure. To what extent does the realignment of power among those controlling the commerce of the Latin Kingdom, especially the Genoese, the Pisans, and the Venetians, affect the patronage of the arts? To what extent does the strengthened position of the Crusader feudal aristocracy appear as a factor in artistic patronage? What evidence is there that the presence of the French regiment, as a legacy of King Louis IX, stimulated artistic production in Acre? What artistic commissions, if any, can be associated with the most prominent of these soldiers, men such as Geoffrey of Sergines, *seneschal* of Jerusalem, and even with *bailli* or with independent wealthy knights such as Eudes, count of Nevers, who died in Acre in 1266?
4. The Latin hierarchy witnessed a change in their relationship with the rulers of the Latin Kingdom during the period of the absentee Hohenstaufens, namely, that the *baillis* who represented regents "did not attempt to exercise patronage in church affairs, and that therefore the church became independent of secular control."[369] Nonetheless, there was strife among the leading prelates at Acre all through the 1250s, and it was not until 1262 that the new pope, Urban IV, the former patriarch of Jerusalem, James Pantaleon, had the practical sense to appoint as the new patriarch of Jerusalem, William of Agen, and specifically gave him administrative responsibility for the episcopal see of Acre where he lived.[370] Acre was, of course, the richest diocese in the kingdom with the greatest number of resident clergy. In other words, Acre was, from an ecclesiastical point of view, undergoing a significant transition during this period. At first the clergy focused on the hope of recovering Jerusalem with the Crusade led by Louis IX, but then they turned to the dashed hopes and the problems of "co-existing prelates" living in Acre, readjusting to the new reality. How did the Church respond to these developments artistically? What changes in church patronage can we see?
5. What other patrons may there have been? How can we evaluate the artistic interests of the great military orders: the Hospitallers, the Templars, and the Teutonic Knights? What impact did the new mendicant orders have as patrons of the arts, especially the Dominicans, who were closely associated with Louis IX, and the Franciscans, who were active in the Holy Land since the time that Francis himself had traveled to the Near East in 1219? What evidence is there for the role which the numerous confraternities, especially in Acre, may have played? What women may have been active patrons, royal and noble women especially, as well as others? Among nonresidents, what Christian pilgrims are there to the Holy Land during this period, who may have commissioned works of art?
6. Once again we can see how the affairs of the Latin Kingdom are closely related to the affairs of the kingdom of Cyprus during this period, especially during the 1250s. Throughout many of these years and on into the 1260s, the kings of Cyprus or their progeny and relatives claimed the regency for the Latin King of Jerusalem. The most dramatic developments in the Frankish East take place, however, in the Latin Empire of Constantinople. There are, of course, direct contacts between Constantinople and Acre by virtue of the presence of Louis IX in the Latin Kingdom, the mendicant orders in both places, and the obvious commercial interests of merchants who had a significant presence in both locations during the 1250s – merchants such as the Genoese, the Pisans, and the Venetians. Then the Latin Empire suffers a sudden end in 1261, when the Greeks reconquer Constantinople. What impact did these developments have on the Latin Kingdom in the 1250s and 1260s? Do we see any arrivals from the Latin Empire playing a visible role in the artistic developments of the Latin Kingdom during this period?
7. The diplomatic activity between the Latin Kingdom and the Muslims that was vigorous before 1244 continued and was even intensified as a result of the negotiations that were necessitated by the vicissitudes of Louis's Crusade and its aftermath. The presence of the king also generated new dimensions of diplomatic interchange, especially with regard to the Mongols who appear as a new threat to Syria in the 1250s, as well as the king's interest in the Far East in general. These developments must also be considered as part of the backdrop that conditioned Crusader cultural and artistic activity during the 1250s, and then even after the defeat of the Mongols by the Mamluks at Ain Jalud in 1260.

8. Finally, Baybars seriously attacked and destroyed important fortifications of the Crusader States in the 1260s, leaving only 'Atlit (Chastel Pelerin), Acre, Tyre, Sidon, Beirut, Gibelet, Tripoli, Tortosa, Margat, Latakia, and Crac des Chevaliers, held by the Franks. When the incursions of Baybars into Syria began, how much interchange was continued with pilgrimage sites there, such as at Saidnaya, and towns with known artistic monuments, such as Qara? How, in the face of the threat of Baybars, did the lines of communication and travel remain open to Sinai, allowing pilgrims presumably to go there, allowing artists to travel between Acre and Sinai, and allowing works of art to be done there and also taken there? Which of the icons we find there were commissioned and produced in Acre and which at St. Catherine's? Why are all of these icons at St. Catherine's now? Besides the ones done there, some with important site-specific iconography, which were taken there as pilgrim's donations in the 1250s and 1260s; which were taken there at some later moment, for example, when Acre was about to fall or just after Acre had fallen in 1291?

We will find that compared to the period before 1244, the difficult years 1244 to 1250 were unsurprisingly void of significant extant artistic activity. However, with the advent of King Louis IX, the situation changes dramatically. Both during his residency in the Latin Kingdom and in the aftermath between 1254 and the end of the 1260s, the level of artistic activity increased remarkably in certain media, especially in manuscript illumination and icon painting.[371] There is evidence of significantly more works produced, an impressive range of work being done from high quality to mediocre works, and there are new types of artistic work done to meet the needs of new functions. Understanding how and why these developments occurred at this time, just when they occurred, and who was responsible for them in terms of patronage are some of our primary concerns in dealing with the art of the Crusaders between 1244 and 1268. Before considering the artistic developments stimulated by the advent and presence of the French king, however, the issue of artistic activity in the years immediately before 1250 must be examined. What work, if any, can be identified from the time the Crusaders lost Jerusalem in 1244 until Louis IX arrived in Acre in May of 1250?

Crusader Artistic Activity in the Latin Kingdom between 1244 and 1250

For the period following the conquest of Jerusalem by the Khwarismian Turks, 1244 to 1250, we are unfortunately left with little written material to help us assess the state of the holy sites. The problem is posed, for example, by the lurid passage in the Rothelin Continuation:

> The Khwarazmians entered Jerusalem, which stood quite empty [23 August 1244]. In the church of the Holy Sepulchre they found Christians who had refused to leave with the others. These they disembowelled before the Sepulchre of Our Lord, and they beheaded the priests who were vested and singing mass at the altars. Then they threw down the marble framework that enclosed the Sepulchre of Our Lord and took the carved columns that stood in front of it and sent them to Muhammad at Mecca as a sign of victory. And for a disgrace and dishonour to Christians, they demolished the tombs of the kings and took the kings' bones and scattered them about. In different ways they soiled and made filthy the holy places, not only in the church of the Sepulchre, but in all the holy places of the city and in all the Holy Land itself, where they committed far more acts of shame, filth and destruction against Jesus Christ and the holy places and Christendom than all the unbelievers who had been in the land had ever done in peace or war.[372]

This account is independently corroborated by Ibn al-Furat:

> The Khwarizmians then attacked Jerusalem and put the Christians there to the sword, may God curse them. Not a man was spared and women and children were taken as captives. They entered the chief Christian church known as Qumama (Holy Sepulchre) and destroyed the tomb which the Christians believe to be that of the Messiah, and they ransacked its Christian and Frankish graves, and the royal graves that it contains, burning the bones of the dead. Thus they brought healing relief to the hearts of a believing people, may God Almighty give them the best of rewards on behalf of Islam and of its people.
>
> After doing what they did in Jerusalem, when they had purified it and purified the Haram (Temple area) and the shrines there from the filthy Franks and the foul Christians, they left for Gaza where they stopped.[373]

By contrast with this, the Noailles Continuation says little:

> These Khwarazmians rode on until they reached Gaza, where they found the army of the sultan of Egypt. On their way they caused terrible damage in the land of Tripoli and elsewhere. So suddenly did they appear at Jerusalem that very few could escape; more than 30,000 were killed, men, women and children, in this surprise attack, for these people took no prisoners, all they wanted to do was kill.[374]

It is difficult to account for the specific depradations mentioned in the Rothelin Continuation, which are problematic for several reasons. First, pilgrims to Jerusalem in the second half of the century who left major accounts of their visits, for example, Burchard of Mount Sion, O.P. (1283), and Riccoldus de Monte Crucis, O.P. (1294), say nothing of this damage to the Holy Sepulcher in their writings. Furthermore, there are no references in other less detailed or systematic pilgrimage texts. Second, although it is possible that the Holy Sepulcher was stripped of its marble decoration, including carved columns, and that these items were taken as trophies, the idea that they were sent to Mecca is hard to verify, but it seems unlikely. No other Muslim accounts discuss such action, but the range of precedents was varied. Saladin had of course quite discreetly avoided any damage to the Holy Sepulcher in 1187, but al-Hakim in 1009 had deliberately destroyed the church. No trophies were involved in either earlier case, but this idea will be met with again between 1244 and 1291. Third, the destruction of the tombs seems to have been a major theme of all detailed reports, both Christian and Muslim, and certainly news of this damage was widely circulated in the West.[375]

The problem of Muslim, and especially Khwarismian and Mamluk, depradations and destruction is a major issue. How much damage did they actually do? In cases of monuments surviving after 1291, when was the repair work done if it was carried out after the Khwarismians or the Mamluks destroyed places in 1244 or in the 1260s? What, for example, can we make of the post-Crusader period drawings of the tombs of the Crusader kings that form our basis for understanding what the original tomb designs looked like in the twelfth century?[376] Presumably these tombs were repaired along the lines of their original designs sometime shortly after the Khwarismian depradations, but we do not know exactly who did the work or when it was done. Could it have been done between 1244 and 1250, or was it after that time?

Or to take another case, already alluded to above, with regard to architecture: what are we looking at today in terms of the walls of Caesarea, which are said to be the constructions of Louis IX,[377] but which Baybars is said to have destroyed personally, when he took Caesarea in March 1265?[378] Even though Ceasarea was later brought into a truce between Baybars and the Franks, 1272–83, no attempt was apparently made to rebuild what Baybars had destroyed, and the city did not come under Crusader control again after 1265. Or again at Sidon, how much of the sea castle was done before 1253, how much should be seen as work done at the time of Louis IX, and how much was later, after 1260, when the Templars held this site against the Mamluks up to 1291? The most recent study of the sea castle at Sidon proposes four phases to the masonry, but this analysis differs from the earlier three studies, and it is difficult to link these phases with specific dates without archaeological corroboration.[379] These are perplexing questions that need serious consideration in relation to the historical context. When would it have been possible for the Crusaders to have repaired the tombs, and when were repairs of the walls at Caesarea or repairs at a number of other Crusader fortifications, along with new construction, actually carried out?

One type of source besides the chronicles that we would hope to be informed by is the accounts of pilgrims to the Holy Land. Whereas we noted in the years prior to 1244 that despite lively pilgrim travel to the holy places, there were few pilgrims' accounts to shed light on the condition of the holy sites, in the difficult period of 1244 to 1250, there is even less evidence of this type. The reasons for this are not far to seek. Pilgrimage travel in these years was unusually dangerous because of the unsettled political and military situation with the Christian holy sites held by the Muslims and competition among the Muslims keen for control over the former Crusader territory now captured.

In sum, it appears that between 1244 and 1250, the Latin Kingdom suffered significant damage to some of its major pilgrimage sites, that is, places that had been primary foci for artistic commissions. In the case of the Holy Sepulcher, for example, it appears that the tombs of the Crusader kings were damaged seriously and that the aedicule of the Holy Sepulcher itself was stripped of some or all of its decoration. In recognizing these developments we must therefore acknowledge that some of the most important developments with regard to Crusader art pertain to damage and destruction. The question we cannot answer as yet is when, how, and by whom repairs were carried out. Presumably, some renovations and repairs were done relatively soon when the marauding Khwarismians had gone and détente settled over the city of Jerusalem under their new Muslim masters. It was, after all, in the interests of the Muslims to allow the important pilgrimage sites to be maintained in some kind of decent condition so that the commerce and fees brought by Christian pilgrims could be continued, even if the stream of visitors must have been greatly reduced. Furthermore, certain farsighted Muslim leaders felt a religious obligation to pay reverence to the sites associated with Jesus as a holy prophet in their faith tradition as well. On the whole, however, it appears that some artistic work, in architecture and sculpture especially, was very much a matter of maintenance and repair as far as we know now. This would change dramatically in the medium of painting, however, with the advent of Louis IX.

Artistic Activity in the Latin Kingdom at the Time of Louis IX (1250 to 1254, and Beyond)

In reporting the record of King Louis IX at his death, Jean, lord of Joinville, writing in 1309, used the words cited as the preface to this section. The question for us to consider here is to what extent this glowing tribute can by extension be also attributed to Louis IX with regard to his activity in the Latin Kingdom of Jerusalem between May 1250 and April 1254. We may note the focus on architecture, especially hospitals and religious architecture for the new mendicant religious orders, in this passage – despite the omission of Sainte Chapelle, arguably Louis's most famous architectural commission in Paris. We also remark on the simile of the king as a skilled manuscript *enlumineur*, even though Joinville says nothing about his interest in illustrated books or his commissions of certain outstanding codices, for which he is credited by modern art historians. Given the prominence of Paris as the European center for manuscript illumination when Joinville was writing, this simile is apt, of course, but it is also applicable for Louis IX personally, who was interested in books – including illustrated books – both in the Holy Land, and during his time in Paris before and after his Crusading experience between 1248 and 1254.

There are other questions we will consider as well. What other art was produced in the Crusader States during the time that Louis IX was resident there? What impact did the presence and patronage of Louis IX have on the artistic development of the Latin Kingdom? How did the art he sponsored change the art of the Crusaders in the Holy Land between 1250–4 and thereafter?

Military and Ecclesiastical Architecture: I commented on architectural developments in the Latin Kingdom in the historical discussion earlier in this chapter. At this point I highlight certain major issues, some that focus mainly on the Crusader capital of Acre and pertain to recent archaeological work done there, some of which pertain to other sites.

THE CITY OF ACRE: With regard to Acre (Map 8A, Fig. 61, Chapter 4), one main problem has been the determination of the location of the outer walls on the northern and eastern side of what is today the old city. Depending on the location of this wall, estimates of the size of the city can vary substantially. On the basis of a careful study done by David Jacoby in 1979, the location of the eastern wall was placed about 50 meters beyond the present Turkish east wall, aligned with underwater harbor remains. The result of this configuration is to estimate an old city enclosure totaling 33 hectares.[380] Other studies based on recent excavations, in particular, that of Benjamin Kedar in 1997, have located the eastern wall much farther to the east by more than 500 meters, with the result that the old city walls enclosed well over 50 hectares[381] (Map 8A). The continuing archaeological investigations and other evidence clearly support the Kedar configuration.

Another main problem has concerned the location of where along the coast the northernmost corner of the wall fortifications for Montmusard, the new city, could be located. Recent excavations have found a likely starting point for the walls about 800 meters north of the current Turkish walls, that is, about 300 meters farther north than previously thought.[382] The result of this change is to enlarge the area of the new city enclosure to about 34 hectares according to Pringle.[383] The overall result is that Acre at its fullest development covered more than 85 hectares, that is, approximately 210 acres, making it the second largest Crusader city in surface area during the thirteenth century by the time its outer walls were completed in 1212.[384] At the same time, it was no doubt the largest Crusader city in population and possessed the most complex system of fortification.

On the basis of Kedar's study, especially his interpretation of the historical and art historical evidence, for example, the panoramic view of the city done in the 1686 and usually assigned to E. Gravier d'Ortières,[385] and archaeological evidence presented by recent excavations, for example, his identification of the location of the cemetery of St. Nicholas outside the modern city walls, at point "Y" on his plan 4 (Map 8A) the location of the eastern walls can be proposed.[386] Kedar's estimate is that based on his new interpretations, the configuration of the city walls that most closely approximates the evidence is the one made years ago by W. Müller-Wiener in 1966.[387] Accordingly, the more detailed map of Acre presented here, Map 8A, incorporates these indications and is based on the plan given by Müller-Wiener, supplemented with other data.[388]

The other architectural matter of some interest in regard to Kedar's ongoing study of the city of Acre pertains to an interesting find he has made in the evidence for the religious and cultural life of the city, as well as for the location of one of its major Muslim and Christian buildings. In a fascinating article, "Convergence of Oriental Christian, Muslim and Frankish Worshippers," Kedar notes that "Ibn Jubayr, the Muslim pilgrim from Spain, saw at Acre in 1184, Franks and Muslims assembled at 'Ayn al-Baqar, the Spring of the Cattle, 'from which God brought forth the cattle for Adam'; the Muslims prayed facing south, near the *mihrab* of the mosque that had stood there in pre-crusade times, and the Franks prayed facing east, at an apse they had added to the original building."[389] Kedar argues that this site had been the main mosque of the city before the Crusader conquest. After the Crusaders took Acre, "the principal mosque apparently became the Church of the Holy Cross, the town's cathedral – but a fraction of the original building, which contained the tomb of the prophet Salih, continued to serve as a small mosque in which Muslims could offer their obligatory prayers, with the tomb of the prophet near its *mihrab*."[390] When the Muslims retook Acre in 1291, Kedar reasons it is probable that the prophet Ali's tomb continued to be revered near what was then the ruins of the cathedral and that what is known today as the cemetery of al-Nabi Salih developed around this tomb. The site of this cemetery is located at point N on his plan 4.[391] This means that the site of the Cathedral of the Holy Cross, which has formerly been located under the modern mosque of Jazzar Pascha, near the Hospital of St. John of Jerusalem, would now be located just outside of the walls of the modern Turkish city, in a position nearly 400 meters to the east of the Jazzar Pascha Mosque. This location is indicated on Map 8A.

The evidence for this argument, which would radically change the organization and location of certain main structures in the old city, will continue to be discussed and evaluated by ongoing archaeological, historical, and art historical research. Meanwhile, the witness that this site provides for the multicultural life of the Crusader city, where Christians and Muslims worshipped in close proximity, is otherwise clear and striking. It indicates in the strongest possible terms that well before the thirteenth century, Muslim and Frankish commerce brought two worlds together in a city that otherwise included a rich cross-section of Eastern and Western Christians. Kedar has made a bold and, on the whole, successful attempt to argue on potent historical and archaeological evidence that to understand what the configuration of that important Crusader city was, we must revise substantially our view of the relatively small and somewhat backwater town that it has become. By peeling off the layers of modern Israeli and Palestinian Arab, early modern Ottoman, and premodern Mamluk Acre, we are gradually being enabled to recover a more accurate idea of what the reality of Crusader Acre really was as the capital and most important city in the Latin Kingdom.

The other issue of interest here in terms of architecture pertains to those written texts from this period, other than the chronicles which I refer to in Chapter 5 and earlier in the present chapter, which shed light on Crusader architecture at this time. One is well-known, the "De Constructione Castri Saphet," written for the bishop of Marseilles, Benoit d'Alignan between 1260 and 1266, which I refer to in Chapter 5 and discuss later. Another is the *Pelrinages et Pardouns d'Acre* from *c.*1260, which documents the fact that an institutionalized pilgrimage had emerged in Acre following the failure of Louis IX to reconquer or reopen access to Jerusalem.[392] The other is not well-known: the inventories written at the time of the death of Eudes, count of Nevers, in 1266. I consider the inventories first.

ACRE INSTITUTIONS AND THE INVENTORY OF EUDES, COUNT OF NEVERS: One of the contents of these inventories, which I examine later in terms of the light they shed on Western works of art found in Crusader Acre between 1265 and 1266, is a list of charitable donations made in the name of Eudes de Nevers to various religious establishments in Acre. This list occurs in roll C of the inventory.[393] This list is of interest because, compared with the compilation made by C. Enlart that is discussed in Chapter 5,[394] it includes not only the expectable major houses in Acre known at this time, but also several which are quite less well-known, and some which are not as yet locatable. Indeed some of the entries are difficult to interpret. Examples of these problematic references are the following:

"Nostre [dame] de Vamit"
"ceus de Sas"
"mesiaus de Saint-Barthélemi de Bereithe"
"ceus de Carpitre"

Hamilton pointed out that "Acre is not a very large city, yet the most recent work has estimated that there were fifty-nine churches and chapels there in the thirteenth century. This was not in itself an excessive number by the standards of many medieval cities of comparable size."[395] As noted in the initial discussion of this issue in Chapter 5, Pringle has (2003) increased this number of churches and chapels to seventy-one. This determination is based on the research he has done for his corpus of Crusader churches, but we await publication of his third volume to see how he identifies the problematic institutions in Acre that appear in this list from the inventory of Eudes de Nevers. Certainly we can observe, however, that the houses listed in the inventory contain a number of names not cited in the more or less contemporary thirteenth-century text, the *Pelrinages et Pardouns de Acre*, written *c.*1260,[396] and do not appear in the maps of Matthew Paris, *c.*1250,[397] or of Pietro Vesconte for Marino Sanudo Torsello, *c.*1310,[398] and his follower, Paolo Veneto, *c.*1320.[399] As the archaeological work goes forward in Crusader Acre led by Eliezer Stern, it will be interesting to observe any additional evidence that may help us locate these houses and identify who they were for and what their function may have been. It is possible that other houses, churches, or chapels may be identified as well, in light of the archaeological findings.

Most of these named houses in the inventory of Eudes de Nevers are, of course, recognizeable. The institutions of Saint Samuel, Saint Lazarus of Bethany, and Saint Anne are no doubt relocated from Jerusalem and its environs. Some of the institutions mentioned here, however, raise particular questions relative to houses belonging to churches of the Eastern Rites, whose adherents formed a significant part of the religious community in Acre. In his discussion of the religious houses found in Acre, Hamilton refers to several that belong to the Eastern Rite churches. He mentions St. Margaret's and St. Sabas, both apparently Orthodox monasteries. He cites an Orthodox cathedral (unnamed) and a Jacobite cathedral, the latter which may have been St. Mary Magdalen's as it also had been named in Jerusalem.[400]

One institution of special interest is that of St. Catherine's in Acre. Pope Honorius III recognized the authority of the abbot of Saint Catherine's Monastery on Mount Sinai over the Church of St. Catherine in Acre, in a document of 1217. Following him, Gregory IX (1227–41), among others, had confirmed possessions of St. Catherine's Monastery on Mount Sinai in Jaffa and Acre.[401] The question is what relation this house of St. Catherine's in Acre had with the monastery on Mount Sinai. Was it a Greek Orthodox house, in effect a *metochion* of the parent monastery, or was it the house for Latin monks who serviced the chapel of St. Catherine's of the Franks in the Monastery on Mount Sinai? Was it in effect a house for both Greek Orthodox and Latin monks connected to the parent monastery? There is no doubt that the Monastery of St. Catherine's on Mount Sinai had many holdings at this time, but the nature of their relationship to the house named for St. Catherine in Acre is clearly spelled out apparently only by the papal bull of Gregory IX.[402] In his text he refers to the Acre property of the Monastery of St. Catherine's on Mount Sinai as follows: "apud Acco, domos et obedientiam sanctae Catarinae." This terminology, comparable to the "obedientiam S. Michaelis" at Alexandria or the "obedientiam s. Moysi" at Jerusalem in the list of properties of the bull, appears to indicate that the property of St. Catherine's at Acre consisted of a house and a convent of monks.

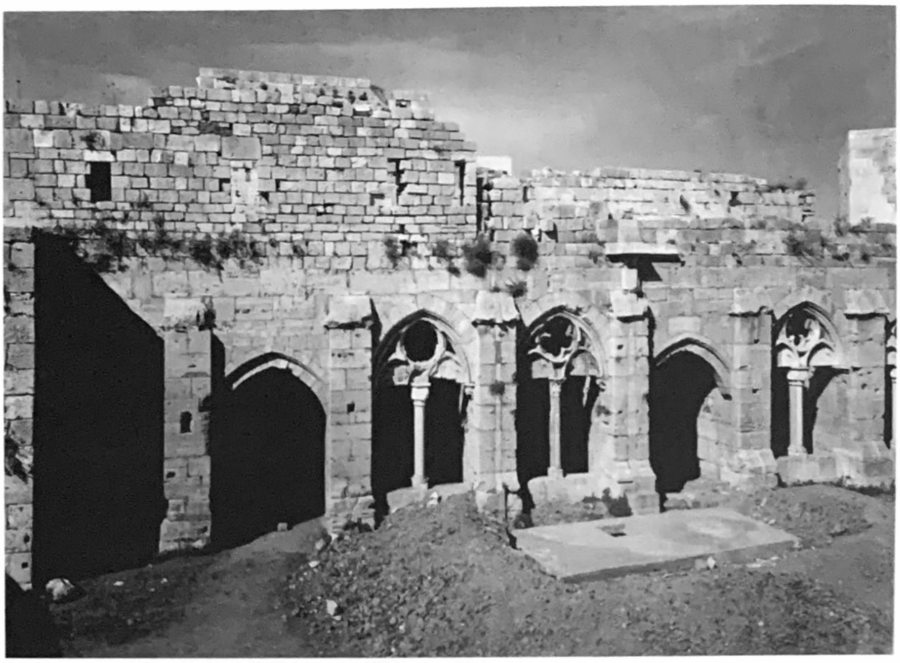
The documentation at present does not yet permit us to answer definitively the question posed here, but two factors should be kept in mind with regard to the third possibility mentioned. First, there appears to be no doubt that Latin monks were in residence at St. Catherine's Monastery on Mount Sinai, who not only ministered to visiting Frankish pilgrims, but also were involved with painting icons for these visitors. The strong art historical evidence, some of which will be presented later, indicates that there were close ties between Sinai and Acre, and this house and convent of St. Catherine's in Acre may have helped to facilitate this interaction. Second, it is striking that among the houses to which bequests are made in the inventory of Eudes de Nevers, none is recognizeably the house of an Eastern Rite church. Yet a gift is made to St. Catherine's. This may indicate that this quite magnificent donation, un "serecot d'escarlate poonnace, forré de menu vair," that is, a surcoat (sleeveless, long, possibly floor-length tunic) made of wool probably dyed with kermes to make the "poonas" or peacock color, which was lined with squirrel fur that showed at the neck,[403] was given in honor of the Latin monks at this house. On reflection, it is not surprising that Eastern Rite houses and churches do not appear prominently in the list of Count Eudes's inventories, because he was a relatively recent arrival from the West, but it is interesting that St. Catherine's does appear. The presence of the Latin monks may have been the reason for this.

It is also interesting to notice that sociologically, this list mentions not only hermits and "povres," but also "béguines." Béguines were women who generally belonged to sisterhoods, who "lived a semi-religious and somewhat austere communal life without vows." Although originally founded in the Netherlands, they spread to Paris by the mid-thirteenth century, and elsewhere, obviously to Acre by 1266. The main aims of these sisters were the service of the sick and the needy, which they combined with time devoted to religious prayer and contemplation. It is not known whether the béguines had a formal house in Acre, and if so what it was called, but it is possible that, as he later did in Paris, Louis IX may have founded such a place there for them.[404]

CRUSADER CASTLES: SAFED

Acre by the 1260s was not only the capital of the Latin Kingdom, but also the center of Crusader political, economic, religious, cultural, and artistic activity in Syria-Palestine. It was also the major fortified city still in Crusader hands. Besides such fortified cities, with regard to castle construction, the two greatest projects during the 1250s and 1260s were the completion of the outer walls of Crac des Chevaliers, and the completion of the construction of the great Templar castle at Safed (Figs. 94–5, Chapter 5). For the latter, a castle that came under Templar control and was rebuilt in the 1240s, its history and construction are discussed in Chapter 5[405] and earlier in this chapter.[406] We refer to it again here because the anonymous text which describes its history and construction, "De constructione castri Saphet," was written for Bishop Benedict of Alignan by an anonymous Western author in the early 1260s.[407]

This text is unique for its documentation of castle building among Crusader fortifications, but its value as a document of the 1260s is mostly historical, because so little of the castle



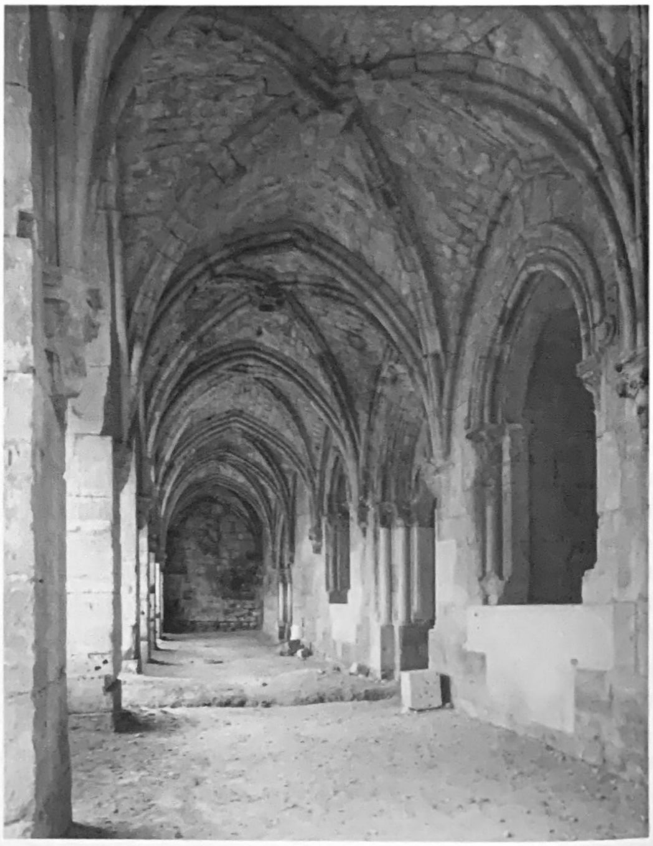
135. Crac des Chevaliers: loggia, exterior view. (photo: Anthony F. Kersting)

remains and little archaeological investigation of the site has been undertaken.[408] In the early part of this text, the impact on the Muslims of rebuilding this castle was clearly stated, that it would close the gates of Damascus.[409] At the end of the text, the meaning of this comment is made clear as the author discusses the function of the castle and its benefits to the Crusaders. 1. It would protect Acre and the environs from Muslim incursions. 2. The important region under the protection of this castle was now safe for its agriculture and its markets, but the most important thing was that it was safe "to preach the faith of Our Lord Jesus Christ freely in all these places and to destroy and disprove publicly in sermons the blasphemies of Muhammad."[410] And 3. finally, the castle would serve to protect a series of Christian holy sites, including especially the mount of the Beatitudes, Capharnaum, Bethsaida, and Magdala, as well as Nazareth, Mount Tabor, and Cana.

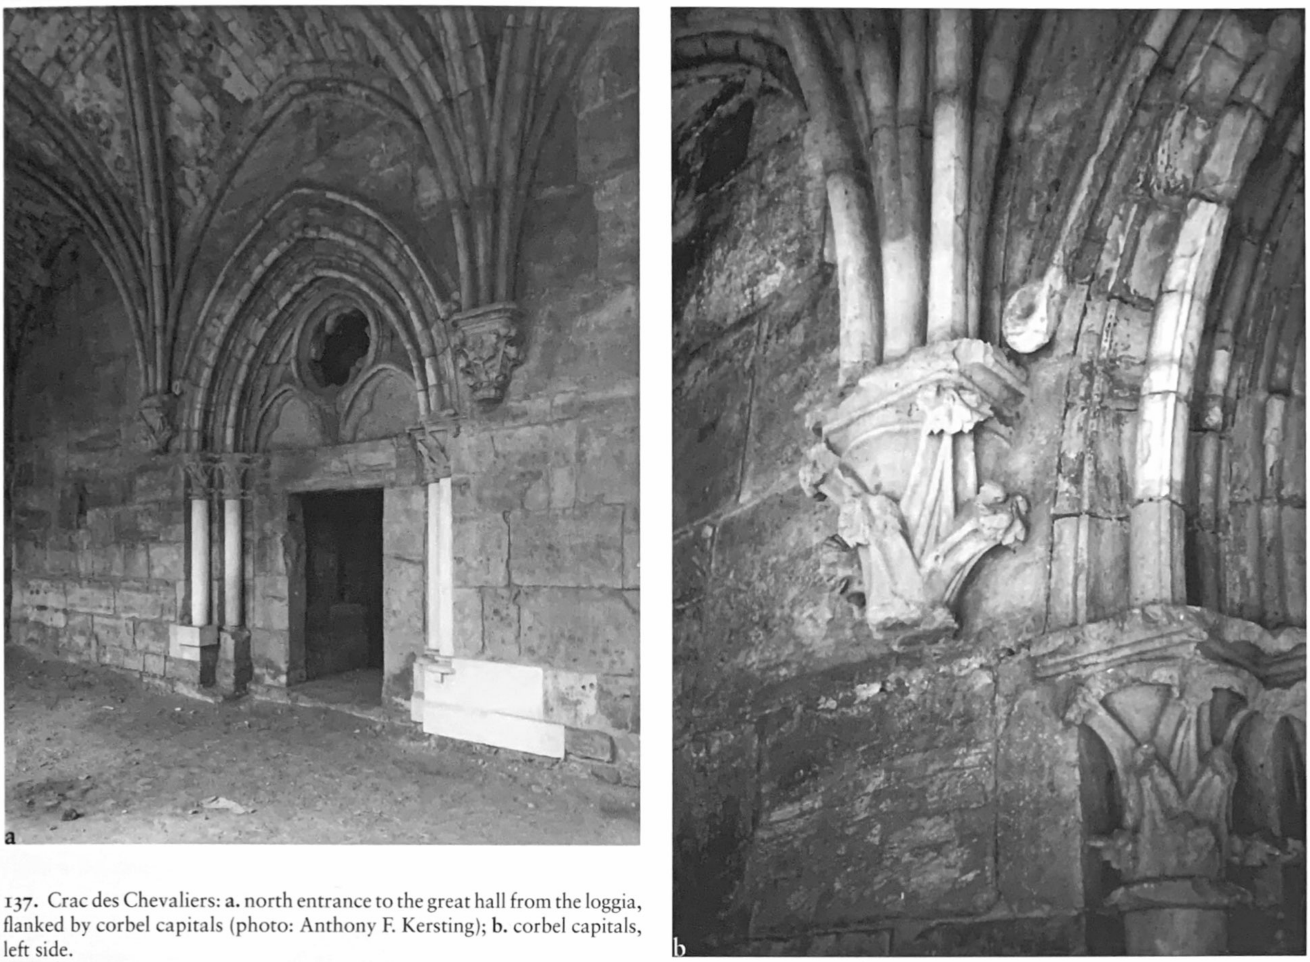
The timing and function of this text then can be seen to be meaningful in the early 1260s in several ways. Following the battle of Ain Jalud, Damascus was back in Mamluk control, and sealing off Muslim Damascus was important again. In the shrinking Latin Kingdom, the area controlled by the Crusaders was viewed with increasing concern, both for economic and religious resources it contained, and Safed was a very significant bulwark, along with Crac des Chevaliers in the Crusader defense. The construction and support of castles like Safed was expensive, and the author of this text spells out what it costs in some detail. The result is that one viable interpretation for this text is that Bishop Benedict of Alignan had it written as a fundraising treatise, not simply a commemorative work in honor of the bishop's latter day visit, 1260–2.[411]

CRUSADER CASTLES: CRAC DES CHEVALIERS

For Crac des Chevaliers (Figs. 135–40, 143), the situation is the reverse compared with Safed. Whereas Crac is perhaps the best preserved, restored, and conserved of all the major Crusader castles in the Latin East – now under the care and supervision of the Syrian Antiquities Department – there is no contemporary text comparable to that for Safed to analyze and explain its function and importance as a special treatise.



136. Crac des Chevaliers: loggia, interior view. (photo: Anthony F. Kersting)

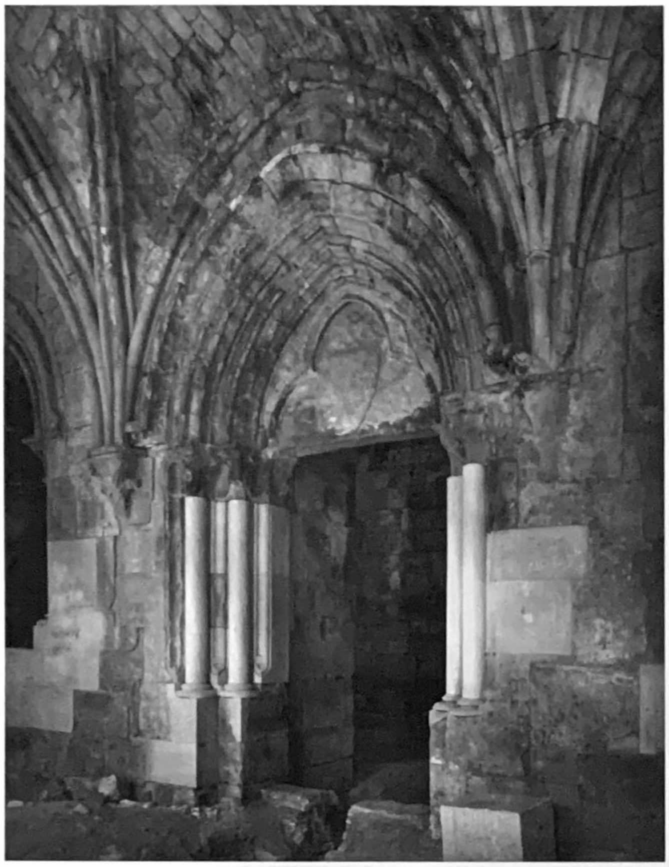


137. Crac des Chevaliers: **a.** north entrance to the great hall from the loggia, flanked by corbel capitals (photo: Anthony F. Kersting); **b.** corbel capitals, left side.

Having started major reconstruction after the 1202 earthquake, the Hospitallers apparently continued building at Crac through the 1240s and 1250s. Architecturally, we have already seen that major features of its Gothic style were in place by the 1230s, and that the Logis du Maitre was completed by *c.*1240. But its most developed and sophisticated Gothic architectural components were apparently done slightly later, the great hall with its loggia in the upper courtyard, opposite the final segment of the vaulted halls constituting the main bent-entrance. The concentric outer walls and the northern postern gate with the inscription of Nicholas de Lorgne were also completed in the late 1250s.[412]

The great hall, built on the site of an earlier hall started in the twelfth century, is obviously "inserted" into the preexisting fabric based on visual features such as the arches and "patched" masonry built into the exterior north wall, and the second-story southern windows of all three bays, limited and partially covered by the vaulting. Nonetheless, it is the largest and most elaborate Gothic architectural complex in the castle. In its final configuration, the grande salle is rectangular in plan (27 × 7.5 meters), with three equal and slightly elongated bays along its north–south axis, each one articulated by four-part ribbed vaults topped by large bosses, open to the sky above in their centers. Each bay of the grande salle, besides its southern window at the second-story level, has at least one opening looking southeast into its loggia or gallery. At some point shortly after the construction of the grande salle, and presumably before the loggia was built, the great hall was divided unequally by a thin internal nonbearing wall, indicated on plan 4 of Deschamps's study, but no longer extant.[413] This division of space yielded a larger northern room of nearly two bays, and a smaller southern chamber of approximately one and a quarter bays. Deschamps correctly comments that this internal partition wall was Frankish. Part of the evidence is the fact that the two entrances from the loggia into the great hall were built to correspond to these two rooms.

The main entrances to the great hall open into the second and fifth bays of the seven-bay loggia on the southeast side. The loggia itself is 27 meters long with a vaulted corridor 2.5 meters wide. The loggia is 5.0 meters wide measured from the outside of its southeastern pier-buttresses to the outer wall of the great hall, with each of its seven squarish bays measuring approximately 3.9 meters long × 3.5 meters wide. The loggia is, however, only one story high, and, set in front of the great hall, it therefore allows the windows of the latter to function as a clerestory to bring light directly into the two large interior spaces. It is somewhat mysterious why the loggia has seven bays with ribbed vaults as a complement to the great hall with three bays. The second loggia bay (from the south) has an external entrance on axis with the entry to the smaller chamber in the grande salle. These entrances are on axis with the center of the interior ribbed vault. The fifth bay also has an external entrance on axis with the entry to the larger chamber, but this axis does not correspond with the centers of either vault in the larger room. These characteristics, along with aspects of the architectural sculpture, indicate that the loggia



138. Crac des Chevaliers: south entrance to the great hall from the loggia, flanked by (damaged) corbel capitals. (photo: Anthony F. Kersting)

was clearly built a bit later in a slightly more decorative Gothic style.

The vaults of the grande salle feature broad, levantine pointed arches, generously wide and not terribly high, in the manner of late twelfth-century Crusader arches in Jerusalem and Tortosa.[414] They are articulated by ribbed vaults that rise from consoles in the side walls, which are decorated with naturalistic leaves. Although the rib moldings here are not so different from those of the loggia, they look thinner and less heavy perhaps because the space they cover is so much larger. In the loggia the arches of the vaults and the entry or window openings appear steeper in proportion to width, and certainly there is more architectural decoration. Not only are the arches of the inner entries and outer faces of the windows into the great hall from the loggia given thin, double voussoir moldings, but they also are framed with thin colonnettes. The consoles and capitals here in the gallery also feature richer variety in Gothic sculptural decoration. The primary unifying architectural motif for the external window openings of the loggia and the entry into the smaller room of the grande salle is a tympanum ensemble that features an oculus above two small blind Gothic arches.[415] The entry from the loggia into the larger room is somewhat more damaged. It has a rather different character, with a steep trefoil arch motif in the tympanum, in the middle of which is a shield on which no doubt arms were carved or painted (or both), with small carved decorative elements above and to either side, none of which can be identified today. The external windows of the loggia are somewhat damaged, but the use of bar tracery is indicated on a limited basis.

Both Enlart and Deschamps have pointed to certain parallels with Gothic developments in France as parallels for many of the architectural and sculptural forms found here in the grande salle and the loggia at Crac. For example, Enlart points to what he calls the somewhat "Romanesque" decoration on the exterior of the window found on the patched north wall of the great hall. In fact his reconstruction of the sculptural decoration is somewhat misleading, however, and one must consult the photographs of the actual window to see its more Gothic character.[416] He also mentions the naturalistic leaf style on the capitals of the consoles, both in the great hall and in the loggia, which are reminiscent of work at St. Nicaise in Reims dating from the 1240s.[417] But the leafy decorations, some of which are quite naturalistic, are not the same on these consoles, and whereas the example he illustrates at the northeast end of the grande salle may be close to St. Nicaise, the examples in the loggia might be linked to other parallels. Overall Deschamps proposes to compare these Gothic features with Sainte Chapelle in Paris, completed in 1248, and the later features of the interior nave of Reims Cathedral. But he reserves to Crac some of the specific decorative floral sculpture in the context of Crusader architectural configurations from the later twelfth century.[418]

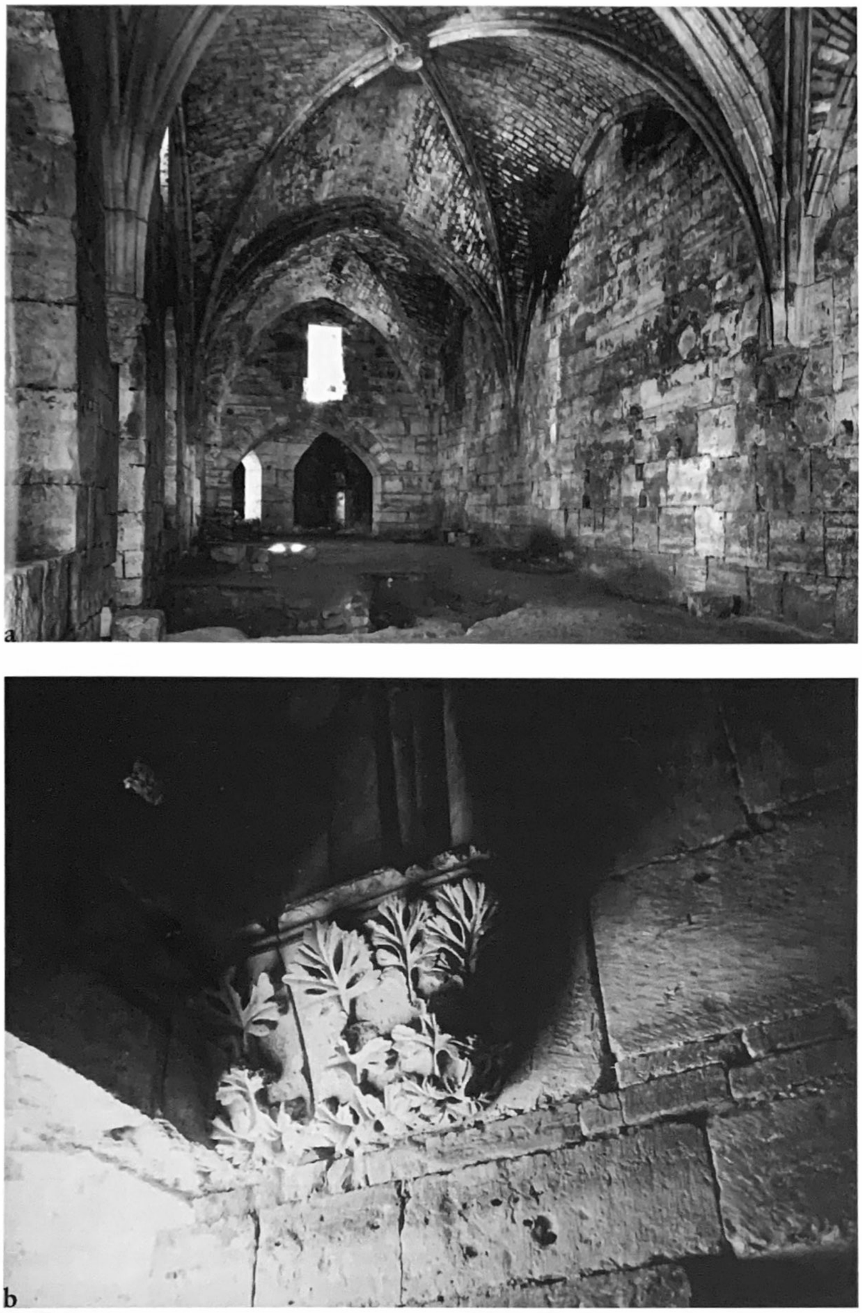
I prefer to position this phase of Crac in the tradition of earlier Crusader work from this area. The two relevant examples appear in Tortosa (Tartus) on the coast just west of Crac. There is the earlier thirteenth-Century Templar grande salle at Tortosa, with its multivaulted and windowed configuration.[419] There is also the early-thirteenth-century work in the west end of the Cathedral of Notre Dame at Tortosa, done by the late 1220s, with its leafy clefs de voutes, Gothic floral capitals, and diminutive heads decorating various sculptural members.[420]

The general dating to the mid-thirteenth century indicated by the style of the architectural elements and its sculpture is corroborated by the palaeography of two inscriptions which appear in the loggia. On the arch of the seventh bay is inscribed the following verse:

Sit tibi copia	Have richness
Sit sapiencia	have wisdom,
Formaque detur	have beauty,
Inquinat omnia sola	but beware of pride which spoils all
Superbia si comitetur.	it comes into contact with.[421]

It is a well-known and impressive expression of solid but sophisticated Christian idealism and virtue widespread in the thirteenth century,[422] appropriated for the Hospitallers in this magnificent castle. Another very small inscription appears on the south pier, in Old French: "Cest labor fu fait el tens de Fre[re] Iorgi [...]xo."[423] Deschamps interprets "Iorgi" to be the name of a castellan of Crac, but unfortunately his name does not appear in any known document. Pehaps he was the castellan following the well-known Nicolas Lorgne, in the late 1260s.

Our analysis of the two main elements of this complex indicates that they were done close in time but with certain notable differences, so that the grande salle may have been built in the later 1250s and the loggia in the early 1260s. The relationship with Western monuments is less specific than we found with many examples in the twelfth century, but some Western influence from developments of the 1240s in France

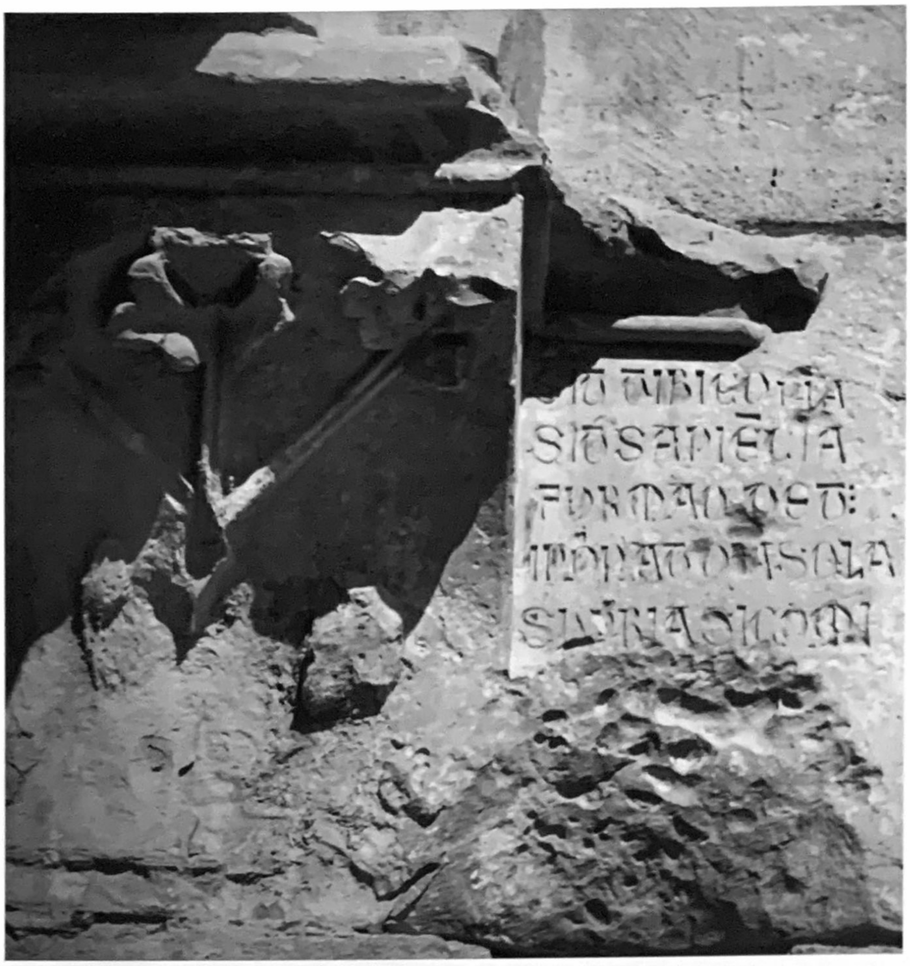


139. Crac des Chevaliers: **a.** great hall, looking south (photo: Anthony F. Kersting); **b.** foliate capital at the northeast end of the great hall.

seems reasonable, because it is elements of that style that Louis IX would have introduced into the Holy Land, however this came about. In any case, the sequence of the grande salle as earlier and the loggia as later is certain, even if the dating is approximate.

Finally, for the outer walls at Crac, the process of closing the concentric enceinte was apparently completed during this period also, with an inscription inside the northern postern gate serving as an indication of when this construction likely ended. The inscription reads: "Au tens de Fre[re] Niciole Lorne [fu] f[ete ceste] barbacane."[424] Deschamps suggests that this inscription indicates the barbican at the northern end of the outer enceinte was built *c.*1255–65, while Nicolas Lorgne was castellan, when these walls were completed.[425]

ECCLESIASTICAL ARCHITECTURE: The issue of ecclesiastical architecture in this period is difficult to assess mainly because the major examples in Crusader Syria-Palestine are destroyed. Certainly we know from the extant examples in Cyprus, especially the cathedral church in Nicosia and the Church of St. Nicholas in Famagusta, that Crusader churches of Gothic style could be quite complex and handsome. In Acre, however, the example that would best inform us of this new Crusader use of Gothic architecture, the Church of St. Andrew, a large and important church probably built before Louis IX arrived there, is now apparently completely destroyed.[426] It was a parish church on the southern edge of the Pisan quarter, and travelers remark on it constantly, both in the Crusader period and later. It was also drawn or sketched constantly after the fall of Acre when



140. Crac des Chevaliers: Inscription on the wall of the great hall. (photo: Anthony F. Kersting)

it was in ruins, if for no other reason because its size made it a notable landmark in the city.[427] Other than St. Andrew's Church, we know of few examples of up-to-date Gothic architecture in Acre because of the destruction in 1291. Ironically this puts the handsome Gothic architectural work at Crac des Chevaliers in greater relief, and it means that we have more sophisticated Gothic architectural remains from a castle, albeit one of the most important Crusader castles ever built, than we have in the context of urban architecture in Syria-Palestine.

CONCLUSIONS: Compared with the discussion of architecture in the period 1225–44, the developments of 1244–68 have generated less commentary here, but that should not mislead us into thinking that architecture was any less important for this later period than it had been before. The difference is explained by several factors. In the years 1244–68 there were major rebuilding projects mainly for large fortifications, which I mentioned in the previous section of this chapter. The architecture of 1244–68 has been heavily destroyed during sieges and later rebuilt by the Mamluks, in the major Crusader coastal cities especially. That which survives is to some extent difficult to recognize among standing remains because it has often been encased in architecture rebuilt by the Mamluks after 1291. These factors should not cause us to overlook the introduction of developed Gothic architecture and architectural sculpture at the time of Louis IX and later. The problem is that we have so little that survives. It is difficult to understand exactly how Gothic style developed in Syria-Palestine after its arrival in the later twelfth century, how it spread to city and castle, and, except for the few main monuments that are extant, how it developed locally with certain external stimulus from France to become a striking presence in the Latin East, eventually becoming a stunning feature of the cities of Famagusta and Nicosia on Cyprus. For the Latin Kingdom it appears that Louis IX must have been instrumental in introducing certain aspects of Gothic architectural style, but he cannot uncritically be assumed to be the source of all Gothic as he sometimes has been interpreted in the past. Gothic architecture was well established in the Latin Kingdom long before the advent of Louis IX. His patronage produced massive rebuilding of fortifications in several sites, but we can connect him to no major church commission. Although the spread of what amounts to certain rayonnant-like Gothic ideas to Crac can be identified after the departure of the king in 1254, and this development may have been stimulated by French architectural design activity, just how the Hospitallers received and employed these ideas at Crac des Chevaliers is not yet known. We may not learn much more about this issue at Crac, but the remarkable fact is that we stand to learn a great deal about the "Gothic phase" of architecture in Acre from the vigorous archaeological work being done there currently.

Sculpture: We can comment briefly at this point on the stone sculpture because there is so little from this period and most of it is architectural. The best of that latter type is seen at Crac des Chevaliers in the form of naturalistic leafy capital decoration. None of the extant architectural sculpture includes figural designs.

The main source of figural designs we find in sculpture from this period appear as linear effigies on tomb slabs (Fig. 141, 142). Just as we have seen a number of incised inscriptions on stone plaques found at Crac, so also there are incised images of figures with inscriptions on tomb plaques. The one dated example from this period is a fragment of a bishop wearing his miter and holding a crozier under a Gothic trefoil arch, above which, in the spandrel is a censing angel. The inscription which is carved into the border reads:

> [Anno domini millesim]o cc qui(n)quagesimo octavo in festo sanctorum [omnium . . .].[428]

This gives us the date, 1258, and the fact that it was found near Jaffa suggests that it was originally placed in a church in Jaffa.[429] There seems to be no doubt that this must have been done for an ecclesiastical tomb, and the type is standard from contemporary Cypriot and French examples. The thirteenth-century plaque of archbishop Thibaud from St. Sophia in Nicosia is one generic parallel, lacking the angel.[430] His crozier, like the one on the Jaffa plaque, ends in a dragon head, and the latter shows dots to suggest the stippling of metal- or enamelwork, as we see in the surviving Limoges examples from the Bethlehem treasure, discussed earlier, or another example now in the Armenian patriarchate in Jerusalem.[431] The famous tomb plaque of the great architect Hugues Libergier (d. 1263) of St. Nicaise at Reims is also a good parallel, with all four similar features: the incised image, a more elaborate Gothic arch, a censing angel, and the inscription carved into the border.[432] The question is how many figures might have been carved on the Jaffa plaque, one or two, because the bishop seems positioned to one side, perhaps indicating that he was one of a pair, and the crozier overlaps the arch. Because Jaffa was destroyed

143. Crusader Figural Sculpture: Crac des Chevaliers: *clef de voute* in the northern bay of the great hall. (photo: after Enlart, *Monuments*)

in 1268, when Baybars captured the city,[433] it is not surprising this plaque was taken and reused and eventually found in broken condition.

Other tomb carving like this, as well as the production of larger sarcophagi, must have generated a good deal of work for Crusader sculptors, even though few examples survive, presumably due to later destruction.[434] The repair of royal tombs in the Church of the Holy Sepulcher after the depredations of the Khwarismian Turks must have been carried out during this period. There must have been a large number of carved sarcophagi and tomb plaques, for example, in the Cemetery of St. Nicholas in Acre, and we wonder especially what the celebrated tombs of prominent men such as Eudes, count of Nevers (d. 1266), must have looked like. Boas has drawn our attention to two sarcophagi that survive in at least partially original condition in the cemetery of Mamilla in Jerusalem. Originally identified by C. Clermont-Ganneau in the late nineteenth century,[435] he suggests that these Gothic-style sarcophagi, only two of which apparently survive now, may have been made for the priors of the Holy Sepulcher.[436]

The fact that there was so much architectural work suggests that there was much architectural sculpture as well, but much less of that survives than the basic masonry work of the fortifications. The fact also that so little Crusader figural sculpture of any sort is found is puzzling, however. The only examples we can cite are the four little heads that appear on the clef de voute in the grande salle at Crac des Chevaliers[437] and the now badly mutilated head, said to be that of St. John the Baptist from the church of St. John in Acre of uncertain date[438] (Figs. 143, 144). The lack of extant figural sculpture in the middle years of the thirteenth century may partly be understood in the context of the later destruction and rebuilding by the Mamluks. Whatever the reasons, this lack is in sharp contrast to the enthusiastic patronage and production of Crusader painting in two media especially, manuscript illumination and panel painting, or icons.

Manuscripts and Icons from Acre: 1250–1254: When Hugo Buchthal published his study of *Miniature Painting in the Latin Kingdom of Jerusalem*, one of the major themes he discussed was the commissioning of manuscripts in the Latin Kingdom for royal and aristocratic, that is, courtly patrons, in both the twelfth and the thirteenth centuries. Among these codices are the Psalter of Queen Melisende (*c.*1135) and the Riccardiana Psalter (*c.*1225).[439] Since 1957 only the hypothesis for the Riccardiana Psalter among these basic and important proposals has been partly discredited, but questions have been raised and refinements have been introduced for understanding the identities of the patron and the recipient and the precise historical circumstances and dating in each case.[440]

One of the most important attributions he proposed in 1957 was that of the Arsenal Bible (Paris, Bibliothèque de l'Arsenal, MS 5211) to the personal patronage of Louis IX during the time of his residence in the Latin Kingdom. In a substantial chapter, Buchthal discussed the Arsenal Bible at some length.[441] He observed that the abbreviated Old French Bible text of twenty books of the Old Testament and the frontispiece illustrations for each biblical "book" of this codex are extraordinary. Indeed he commented that the lavish decoration is "distinctly aristocratic in character, is of a scope similar to that of the early Psalters in London and Florence, and thus suggests that the manuscript was produced for a royal owner. It will indeed be seen that it is possible to connect it with the King of France who was the most generous royal patron of the arts in the thirteenth century."[442]

Buchthal formulated his argument attributing this codex to Louis IX based on the character of the style of its miniatures, the sources and program of their iconography, the nature of the artist who executed the work, and the resources of the scriptorium where the manuscript was done. He concludes his discussion by saying, "the combination of the Imperial Byzantine tradition with that of the most 'modern' royal manuscripts produced in metropolitan France, the *Bible Moralisée* and the Morgan Picture Book, is itself almost an epitome of St. Louis's policy in the Holy Land, for it expresses the King's desire to infuse new life into that unfortunate cause which he had made his own, and on which all the vain hopes and longings of western Christianity were focussed."[443]

Since Buchthal's publication, the most important study to appear on the Arsenal Bible is that by Daniel Weiss, who published

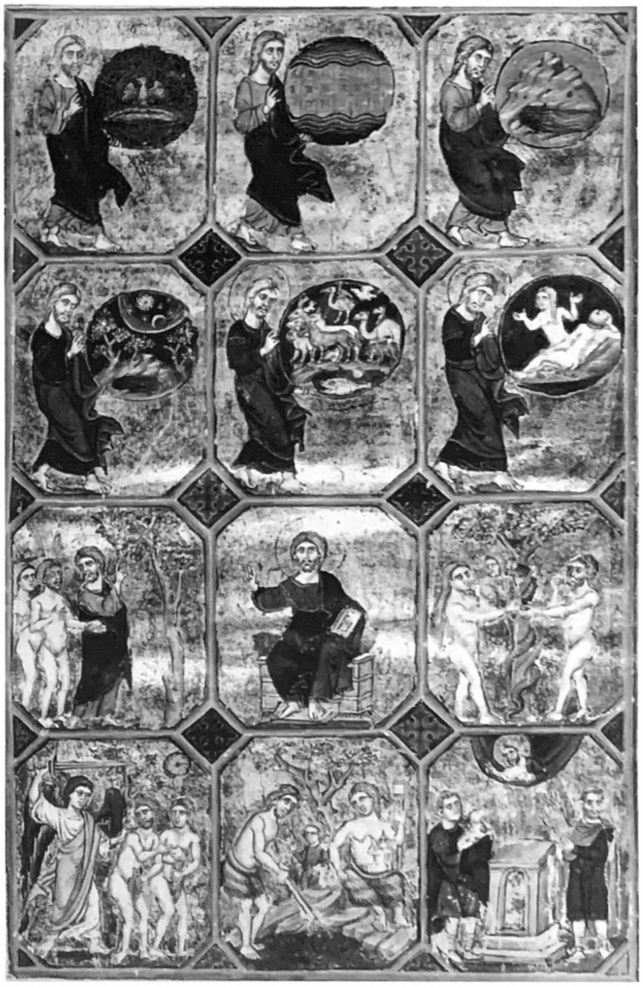
145. The Arsenal Bible, Paris, Bibl. de l'Arsenal, MS 5211: fol. 2r, (D)evine . . . , (historiated initial), Dominican friar writing. (photo by courtesy of the Bibliothèque Nationale de France, Paris)

his book, *Art and Crusade in the Age of Saint Louis*, in 1998.[444] This book is the culmination of a series of shorter studies published between 1992 and 1998.[445] It includes a comprehensive study of the imagery of the Arsenal Bible that takes the points which Buchthal argued, expands the substance of their content, and adds important new aspects to the arguments, especially in terms of royal French ideology. His analysis of the Old French text abridgement, and his discussion of the criteria utilized in the selection of scenes for the frontispieces, focusing on episodes of battle and holy war, in addition to the imagery of kingship and Old Testament heroines, provide an interpretation in which the texts and the images are seen as complementary. The nature of the book and its decoration, the peculiarities of the textual and pictorial selections, and the meaning and content of the imagery of the frontispieces provide evidence for him to argue that this is a royal book intended for personal study and prayer, "with little value for biblical study or clerical use."[446] Weiss approaches Arsenal MS 5211 with strong emphasis on its French connections. He links the imagery in this book to major royal commissions in Paris done before Louis IX came to the Holy Land, most notably Sainte Chapelle, in addition to the Moralized Bibles and the Morgan Old Testament Picture Book (Morgan Library, MS 638). In doing this, Weiss achieves the major accomplishment of creating an artistic ambience for Louis IX, which stretches from France to the Near East and integrally connects Paris and Acre, the Capetian kingship and the Crusade, and Louis's role as French king as parallel to those rulers and leaders, heroes and heroines, of the chosen people in the Old Testament as fundamental to the meaning and content of his artistic program and patronage.

Let us reexamine this pivotal manuscript and review the evidence for connecting Louis IX with its production. Are there yet further aspects of the program of imagery that can offer additional support for the idea that this book was a royal commission linked with Louis IX during his time in the Latin Kingdom? Let us reconsider the evidence provided by this book, the circumstances of its production, its patron and dating, the nature of the artist and his sources and the artistic character of the iconography and style of its miniatures as a program vis-à-vis related art of the Crusaders, in an effort to better understand artistic developments in the Latin Kingdom in the 1250s.

THE ARSENAL BIBLE, *C.*1250 (FIGS. 145–148, COLOR PL. 3, CD NOS. 38–71): The most famous work of figural art from the Crusader East with which the name of Louis IX is personally associated was apparently commissioned by him in Acre. So far as we know, it was carried out during the time that Louis was resident in the Latin Kingdom, that is, May 1250 to April 1254, indeed probably early in that time frame, while he was actually residing in Acre. Known today as the Arsenal



146. The Arsenal Bible, fol. 3v, Frontispiece to Genesis, with twelve scenes (full-page panel):
1. First Day of Creation: The Spirit of God moves upon the face of the waters (Gen. 1:2).
2. Second Day of Creation: The Dividing of the Waters (Gen. 1: 7).
3. Third Day of Creation: Appearance of the Dry Land (Gen. 1: 9).
4. Third and Fourth Days of Creation: Creation of Vegetation, of Sun, Moon and Stars (Gen. 1: 12, 16).
5. Fifth and Sixth Days of Creation: Creation of Fish, Fowl, and Animals.
6. Creation of Eve (Gen. 1: 21, 25).
7. Adam and Eve Given Trees for Food by the Lord (Gen. 1: 29).
8. Seventh Day of Creation: The Lord rests (Gen. 2: 2).
9. The Fall (Gen. 3: 6).
10. The Expulsion (Gen. 3: 23).
11. Adam and Eve Toiling (Gen. 3: 19, 4: 1, 2).
12. The Offerings of Cain and Abel (Gen. 4: 3, 4).

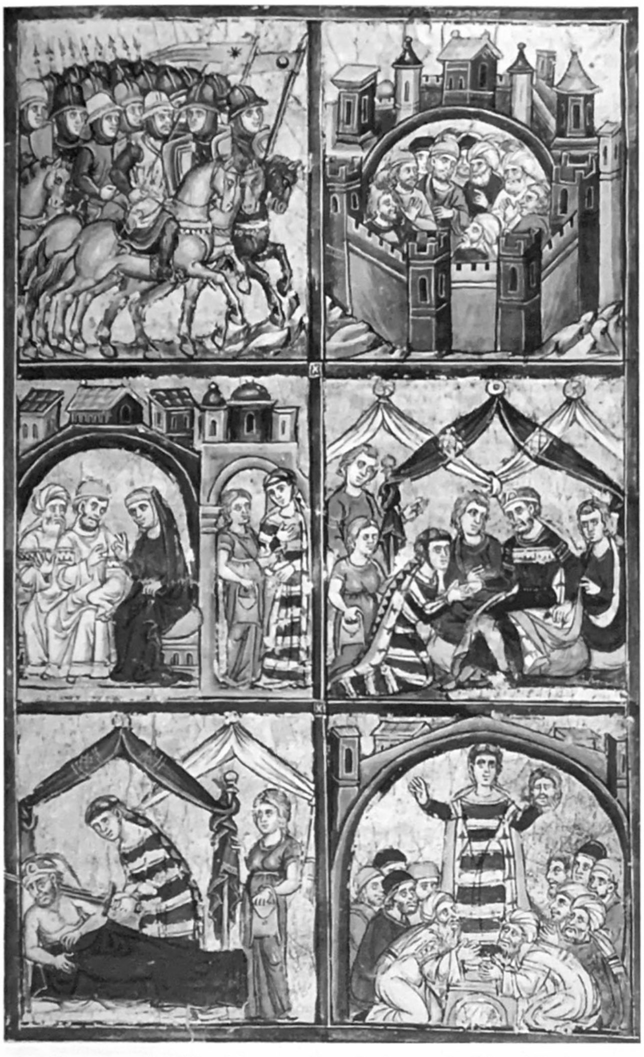
Bible, it is now preserved as MS 5211 in the Bibliothèque de l'Arsenal in Paris.[447] This book is one of the few extant illustrated manuscripts attributed to King Louis IX East or West, and the only one linked directly to him in the Latin Kingdom.[448] Compared with his mother, Queen Blanche of Castile, as a patron, Louis has been characterized as being "more restrained vis-à-vis illuminated manuscripts."[449]

We know of Louis's lively interest in the arts prior to his Crusade from his magnificent commission of Sainte Chapelle in Paris during the 1240s. Furthermore Joinville and other biographers writing in the later thirteenth and the early fourteenth centuries specifically refer to Louis in terms of his interest in books while he was in the Holy Land. We learn, for example, that all through his life "Louis set aside part of every day for reading or listening to readings."[450] Among the most prominent examples of his interest in books having to do with his first Crusade and his time in the East, 1248–54, we know of the restoration of Louis's personal prayerbook by miraculous means during his imprisonment at al-Mansurah in April 1250, an event made famous at the time of his canonization.[451] Somewhat earlier, in December of 1248, during his sojourn on Cyprus, Joinville tells us that Louis IX sent books to the Mongol Khan, Güyük, along with other impressive diplomatic gifts, in the hands of his envoy, Andrew of Longjumeau, O.P.[452] We also know that Louis and his wife, Marguerite, gave William of Rubruck, O.F.M., a Bible and an illustrated psalter, respectively, as he was preparing to set out on his mission to visit the great khan in the East, in 1253.[453] These were books that the king and queen apparently had made for the Dominican in the Latin Kingdom. In the summer of 1252, while Louis was personally supervising the work of rebuilding the walls at Jaffa, Joinville tells us he commissioned a new Franciscan house in that city and had books made for their services and for study.[454]

After Louis returned home to France in 1254 we know his interest in books strengthened and expanded. For example, he commissioned the justly famous and important royal psalter, what is known today as the St. Louis Psalter (Paris, B.N.MS lat 10525), perhaps soon after his return. But Louis also founded an important library attached to Sainte Chapelle, and the idea for this was identified as originating during the time he spent in the Near East on Crusade, thereby creating another link between Paris and the Holy Land. The idea of collecting books may have first come to him while he was incarcerated in Egypt, where he was apparently told of a great Muslim sultan, probably al-Hakim in Cairo, who had commissioned and collected a great library of books. Whenever he first heard about it, Geoffrey de Beaulieu, who tells this story, includes it in his life of the king just after Louis had gone on pilgrimage to Nazareth, when he returned to Acre, so it is not certain exactly where and when the idea started.[455] It is certain, however, that it occurred while Louis was in Outremer, and the result was that one of his first projects after he returned home was the construction of his own library. Indeed this library was placed at the heart of the palace complex and was designed as a small-scale replica of Sainte Chapelle to which it was joined.[456] Although we know little about the contents of this royal library, we may imagine as Weiss first suggested that one of the first books to find a home there was the codex we call today the Arsenal Bible.

As for the production of the Arsenal Bible, neither Joinville nor his later biographers discuss books among the various artistic projects of the king during his residence in Acre; they only comment on his strengthening of the city walls. Placed in the context of Acre from his arrival in May of 1250 to his departure for Caesarea in the spring of 1251, however, the king very likely commissioned the Arsenal Bible while he was in the process of recuperating and reorganizing. The book was likely produced just as he began his energetic activities to help strengthen Acre. Following the debacle in Egypt, when he arrived in Acre he presumably had to reconstitute and reorganize everything in his new circumstances: his *capella regis*,[457] his court, his chancery, his military commanders and army, and other administrative personnel to meet his new responsibilities as resident leader – but *not* resident king, he was always careful not to infringe on the legitimate rights of others – in the Latin Kingdom. Indeed, it is highly likely, I propose, that this unusual, lavishly illustrated, and very personal book of Bible selections



148. The Arsenal Bible, fol. 252r, Frontispiece to Judith, with six scenes (full-page panel):
1. The army of Holofernes departs for the kingdoms of the west (Jud. 2).
2. The Israelites of Bethulia (Jud. 7)
3. Judith rebukes the elders, adorns herself, and sets out with her maid to find Holofernes (Jud. 8: 10ff., 10: 10).
4. Judith kneels before Holofernes (Jud. 10: 19–20, 11: 1).
5. Judith slays Holofernes (Jud. 13: 6–10).
6. Judith displays the head of Holofernes to the elders (Jud. 13: 19).
(photo by courtesy of the Bibliotheque Nationale de France, Paris)

was conceived and executed for the king while he was involved in discussing and planning his future course of action in Acre and pursuing the goals he had identified in the summer and fall of 1250.

That the Arsenal Bible was done for private use seems evident because of its comparatively small size, the fact that the book is written in Old French rather than Latin, and the rather colloquial and unpolished character of the vernacular text. The book can be seen as a royal book from a variety of features. There is the rich imagery of its illustrations drawn from a number of exquisite royal or imperial picture cycles used as models. There is the lavish decoration done in an elegant style of remarkably high quality, and the creative design of both the ornamental and the figural program of decoration. Finally, we see the special selection and the specific nature of the Old Testament selections introduced by frontispieces with iconography that emphasizes royalty, and content that is directed toward leadership and rulership in the Holy Land. All of these factors refer to a royal patron, in addition to the fact that clearly money was no object in this project. Indeed, it is a book, which, despite the lack of a colophon or a liturgical calendar, when its text, its codicology and its decoration and illustrations are analyzed carefully, can provide substantial evidence for linking it directly to King Louis IX in Acre.[458]

Arsenal MS 5211 is a book of modest size (28.5 × 20.0 cm) that was made for private and individual, not clerical or academic, reading. It is a codex *de grand luxe* with twenty mostly full-page frontispiece miniatures; twenty large ornamental initials, six of which are historiated; and numerous smaller initials, all of which are French Gothic in character. Seventeen of the frontispieces contain multiscene narrative imagery; three contain, in effect, author portraits.

The significance of the Arsenal Bible for Crusader manuscript illumination was epitomized when Hugo Buchthal concluded, "the illustration of this manuscript is in fact the crowning achievement of miniature painting in the Latin Kingdom."[459] This is, of course, an audacious claim in the face of outstanding works from the scriptorium of the Holy Sepulcher in Jerusalem, such as the Psalter of Queen Melisende from *c.*1135.[460] It is particularly important therefore that we examine this manuscript in detail to understand fully its singular stature, its artistic nature and distinctive characteristics, and the curious contrast between its "primitive" Old French text and its elegant decoration. How can we account for a manuscript of this superb quality about which Buchthal exclaimed, "never before nor afterwards did any Latin illuminator make such supremely intelligent and fruitful use of Byzantine models."[461] How could a codex of this quality emerge from a scriptorium relocated to Acre from Jerusalem, which had had only sporadic production in the first half of the thirteenth century? At best only three or four illuminated codices can be credited to this relocated scriptorium between 1187 and 1250, and none in the last decade before the arrival of the French king. What is the evidence that links this manuscript indissolubly to Acre and to King Louis IX? What does this manuscript tell us about the nature of Crusader manuscript illumination in Acre in 1250, and how it has changed and developed in contrast to earlier Crusader manuscripts produced in the tradition of the scriptorium of the Holy Sepulcher in Jerusalem?

Our basic understanding of the Arsenal Bible as a work of Crusader art has been established by two scholars in the twentieth century, Hugo Buchthal and Daniel Weiss, as mentioned earlier. Buchthal first identified the Arsenal Bible as a masterpiece of Crusader painting and analyzed its style and iconography in illuminating detail, enabling us to see the Crusader characteristics of its imagery and the strong impact of Byzantine models. Weiss has now also demonstrated with great rigor and precision the strong ties between the Arsenal Bible and its Parisian French manuscript sources such as the Oxford Bible Moralisée and the Morgan Old Testament Picture Book, M. 638, as well as the pictorial program and the architecture of Sainte Chapelle itself. He has proposed convincingly the metaphor that the Arsenal Bible and Sainte Chapelle form an artistic bridge linking Paris and Acre. He has argued persuasively that the images of the Arsenal Bible function both "as an illustrated biblical narrative and as a contemporary rendering of the crusading enterprise under Louis IX."[462] What additional insights can a reexamination of this remarkable manuscript yield?

The text of this manuscript is the first feature that must be considered. Not only is it an early-thirteenth-century translation of the Vulgate Old Testament into Old French, but it is also a relatively heavy-handed and inelegant early version appropriated by the scribes of the king in Acre just at the time that a new and more polished edition was being prepared in Paris.[463] Indeed Samuel Berger called the text of this particular manuscript unique,[464] and characterized the texts of the various selected books of this Bible as a kind of Bible paraphrase composed of extracts not otherwise known from earlier sources, with the exception of the Books of Kings I–IV.[465] We now know that the text of this Bible is not unique but can be found partially at least, in seven other manuscripts, of which six survive, one of which indeed was also made in Acre somewhat later, about 1280.[466] We also know that the text of each book varies enormously in length and content. The book of Judges is the longest (fols. 81r–120r), and the book of Deuteronomy is the shortest (fols. 68r–69r).[467] Judges is, of course, a long book, but Deuteronomy is even longer in the Vulgate, so in this Old French edition we have certain books that are heavily abbreviated and condensed. The problem is that there is no modern critical edition of this version of the Old French translation, and no full study of how, where, and by whom the translations of the various books that constitute this Bible text were originally done.

The text consists of seventeen more or less self-contained book units, plus the Book of Proverbs broken down into three parts, which in this codex are called "Wisdom," "Parables," and "Proverbs." The last section of Proverbs also contains a small selection of passages from the last chapter of Ecclesiastes. All together, the result is a total of twenty "books" of the Bible, each with its own frontispiece miniature to introduce it. The text shows many signs of being an early Old French version in various ways. There are awkward phrases and errors in the text, the latter mostly consisting of duplications or the miscounting of chapters. The grammar is not always correct, and in some cases the language can be called coarse.[468] The system of chapter divisions, the use of chapter headings and major and minor initials, and the appearance of rubrics are all somewhat irregular.

It is indeed interesting that these early versions of the books translated into Old French should have been used for this book in 1250 at a time when the study of the Bible, both in Latin and in Old French, was receiving such vigorous attention in Paris, already since *c.*1200. In Latin, the new University Bible edition in a variety of formats was popular and had been produced in large numbers since *c.*1230.[469] In Old French, new and more refined translations were well underway by 1250 in France after initial clerical and even papal opposition had been overcome. But even though a complete vernacular translation was not achieved until later (*c.*1280) in France, this Bible of St. Louis "represents the highwater mark of early medieval translation from the Old Testament."[470] It is significant that it occurs in a situation closely linked to the Crusades, to the king, and to the military orders in Acre. The link to the Crusades and the king is seen in the fact that this codex was apparently produced in Acre, the capital of the Crusader Kingdom, for Louis IX. The link to the military orders is partly evident in the translation of Judges.

Although the text of the book of Judges is comparable in both Arsenal 5211 and Paris B.N. MS nouv. acq. Fr. 1404, the latter a Bible codex done in Acre *c.*1280, and although the text in the former codex is the more complete version, it is only in the latter codex that we find the prologue to Judges that contains the crucial evidence pertaining to the initial translation of this text into Old French about 1173–4 in England.[471] Weiss agrees that both MSS must have been written from a common source that included the prologue. This common source was in all probability the manuscript of the translated text written for Richard of Hastings and Othon of St. Omer, two Templar knights – both masters of the Templar Order in England – who lived in the second half of the twelfth century. Othon died about 1174, and their manuscript was apparently then taken to the Holy Land when Richard of Hastings traveled there in 1185, where it became the property of the Templar headquarters in Acre after his death. In the thirteenth century it was apparently available for use in the preparation of both Arsenal 5211 in 1250, and MS n. acq. Fr. 1404 in 1280. Because not only Judges but also sixteen other books of the Old Testament are included in Arsenal 5211, we would like to know the story of how this selection was made and how each one of them came to be available in Acre as well, that is, whether as separate books of the Old Testament or in some kind of earlier compilation.[472]

Buchthal himself suggested that the Old French text of the Bible as we have it in MS 5211 was appropriate and to be expected in a Crusader commission *c.*1250, because this was the version that must have been circulating among the Frankish barons who gave Louis such an enthusiastic welcome when he arrived in Acre in May 1250. Indeed, he states, "the emergence of the military aristocracy as the principal vehicle of authority in a State which had entirely lost its original theocratic character is reflected in the use of this imperfect French translation in a manuscript of the Bible which was destined for the saintly King of France, and whose decoration must have been deliberately planned as a paragon of Crusading illumination."[473] The fact is, however, that we do not know if the text of the Arsenal Bible existed as a comparable unit before this commission. What we do know is that with the possible exception of Job, the Old French texts of the individual books that are included in this Bible existed already and may have been available separately, or in a larger work organized differently, for the Frankish barons to read as Buchthal imagined it.

Buchthal also restated the old idea that the scribe could have been a Dominican, based on the appearance of a Dominican in the first historiated miniature of the manuscript. On this point, he followed Berger,[474] and he was also thinking of the long tradition of Dominican involvement with Bible studies in Paris, both at the University of Paris and in regard to the royal Moralized Bible project in the years after *c.*1215. Buchthal even suggests the possibility that the Arsenal Bible might have been executed at the Dominican house in Acre, an idea I return to later.[475] In this regard, we should bear in mind that Louis's confessor, Geoffrey de Beaulieu, a cleric who accompanied him throughout his time in the Near East, was also a Dominican.

It is evident, in sum, that the text of Arsenal MS 5211 is interesting and special and still holds many secrets that further study can expect to discover. For our purposes it is important to see that the text itself seems to bear links to Acre and to the

Templars, at least indirectly, and these links are reexamined later in the discussion of B.N. MS n. acq. Fr. 1404,[476] in terms of its text and miniature decorations. It is also interesting that the Old French prose translations of these texts are all early, coming from the late twelfth and early thirteenth centuries. Seen from hindsight, the text may appear to be somewhat inelegant in comparison to the impressive painted decoration, but looked at in the context of its period in the first half of the thirteenth century, this text is the most up-to-date available and a worthy setting for the handsome frontispieces and initials. Other aspects of this book seem to connect it with early-thirteenth-century developments as well.

Besides the nature and content of the text, the specific choices of biblical books for this manuscript are of great interest, along with the order in which they are placed. It is remarkable that for this manuscript the Book of Psalms, which was the oldest biblical text to be translated into Old French, was omitted, along with the entire New Testament. This immediately alerts us to the special nature of this book of Bible selections. What was chosen was apparently quite deliberate and carefully focused on the Old Testament history of the Holy Land and the leaders of the chosen people of God in the Holy Land.[477] It included the Books of I–IV Kings, texts translated into Old French in the twelfth century, as well as the Book of Job, for which the text in this manuscript is the oldest extant version translated into Old French.[478]

What are the specific books contained in this Bible, and in what order are they placed? The Arsenal Bible contains the following books in this order:

1–5. The five books of the Pentateuch (Genesis, Exodus, Leviticus, Numbers, and Deuteronomy)
6. Joshua
7. Judges
8–11. I–IV Kings
12. Judith
13. Esther
14. Job
15. Tobit
16–18. Proverbs (in three books, with brief passages from Ecclesiastes)
19. Maccabees
20. Ruth

This selection clearly brings to mind a series of important French works, illustrated "Bibles" from earlier in the thirteenth century with or without text, which I list for comparison, both in terms of the books contained or represented, and the order of those books.

The two earliest *Moralized Bibles*:

Vienna MS 2554:[479]
1–5. The Pentateuch
6. Joshua
7. Judges
8. Ruth
9–12. I–IV Kings

Vienna MS 1179:[480]
1–5. The Pentateuch
6. Joshua
7. Judges
8. Ruth
9–12. I–IV Kings
13. I–II Esdras
14. Job
15. Daniel
16. Tobit
17. Judith
18. Esther
19. Maccabees I–II
20. Apocalypse

The Morgan Old Testament Picture Book:
Morgan MS 638:[481]
1. Genesis
2. Exodus
3. Joshua
4. Judges
5. Ruth
6. I Kings
7. II Kings

Ste. Chapelle (stained-glass windows):[482]
(North Side)
1. Genesis (Bay O)
2. Exodus (Bay N)
3. Numbers (Bay M)
4. Deuteronomy (Bay L)
5. Joshua, and Ruth in the Rose (Bay L)
6. Judges (Bay K)
(East End – Chevet)
7. Isaiah – Tree of Jesse (Bay J)
8. Infancy, St. John the Evangelist (Bay I)
9. Passion of Christ (Bay H)
10. Life of St. John the Baptist, Daniel (Bay G)
11. Ezechial (Bay F)
(South Side)
12. Jeremiah, Tobit (Bay E)
13. Judith, Job (Bay D)
14. Esther (Bay C)
15–18 I–IV Kings (Bay B)
19 History of the Relics of the Passion (Bay A)
(West Façade)
20 Apocalypse (Rose Window)

These lists of contents with their order of presentation are interesting because they demonstrate several points. 1. All of these "Bibles," including the stained glass of Sainte Chapelle, are obviously somewhat different in their content and their organization. 2. Whereas all of these "Bibles" feature a selection of biblical books; none is the same and none contains the complete Old (or New) Testament.[483] 3. The core of all of these programs is, however, a selection of Old Testament books, including some version – complete or incomplete – of the Pentateuch plus the three additional books of the Octateuch, that is, Joshua, Judges, and Ruth, and the Books of Kings, again, complete or incomplete. From this structural evidence it seems clear that the imagery of Arsenal MS 5211 shares with its royal Parisian predecessors overall a similar conceptual outlook, a program of illustration conceived along somewhat similar lines, and a characteristic selectivity that reflects the interests and the desires of the patron in consideration of the function of the individual work in question.

What is distinctive about the selection of Old Testament books and the imagery in Arsenal MS 5211? Although variations in the order of Latin biblical books are well known in complete Bibles during the thirteenth century, as Light and others have noted and as Weiss has reminded us,[484] the arrangement here is noteworthy for several aspects. To start, there is the rearrangement of the books into, in effect, two sections.[485] The first deals with the history of the Holy Land and the leaders of the chosen people from the time of creation up through the kings of Israel, especially David and Solomon (Genesis – IV Kings).[486] The second deals with a gallery of leaders and their deeds or sayings: heroines, holy men, wise men, heroes, ending with another heroine, Ruth, the third of three (Judith, Esther, Ruth). It is also significant that the location of both Ruth and Judith in the usual Vulgate sequence[487] has been changed to help emphasize the shape of these two sections. Their new locations in the sequence, one at the start of the second section and one at the end, shows that the scribe and patron wished to change the traditional and time-honored content and sequence of the Octateuch (Genesis–Ruth) and that they wished to balance Old Testament heroines and heroes, by placing Judith and Ruth as the framing books of this section. In the second section, it is, however, the text of Solomon's Proverbs that is given the fullest presence, accounting for nearly 10 percent of the manuscript, whereas the other books are handled in the abridged manner otherwise normal in this codex. Thus the figure of Solomon links the first and second parts of this Bible, both in the textual presentations and, as we shall see, in the imagery. The book of Ruth ends the volume matter-of-factly with the words, "Ysai engendera David le roi. Ici fenie le livre de ruth la moabitiene."

It seems clear that the selection of books and their order as well as their content – that is, which texts are present in the fullest form, which are heavily abridged, and what the basis of their text and translation may be – are all significant. Although none of the books in this manuscript is given a prologue,[488] unlike the practice in Latin Vulgate Bibles, almost all books in this codex have rubrics to introduce the text of each new book. The size and content of these rubrics do not however correspond to the size (length) and content (full or abridged) of the texts, however. For example, the largest and most elaborate rubrics are found for the following books: for Judith at fol. 251v, for Esther at fol. 261v, and for Maccabees at fol. 339r, not for Judges, I–IV Kings or Proverbs, which have the fullest texts.[489] It is, however, important to note that neither the rubrics nor the texts – nor the images either for that matter, to be discussed later – otherwise give us any clear indication that this volume is not complete as planned.[490] Instead each element helps us to understand that this is a personal, indeed, a unique, commission in the form as we have it. We must apparently conclude with Arsenal MS 5211, as we conclude with regard to Vienna MSS 2554, and 1179 and Morgan MS 638 that these royal manuscripts are all essentially complete as planned. This is uncontestably true with Sainte Chapelle, for example, and an important factor to consider by comparison. The greatest weight of evidence for this conclusion lies in the iconographical program for the imagery of each codex, but the framework of which selections were made for the scenes in each frontispiece and how they are arranged are relevant also.

In sum, the conceptual framework of this volume of Bible selections is important to recognize as belonging to a genre of royal commissions from the first half of the thirteenth century. We can see from our examples how interesting the package of selections is in each case with reference to Arsenal MS 5211. The point here is that with these examples we are apparently dealing with royal books or royal programs, primarily drawn from the Old Testament. Two of these commissions were ordered and supervised by Louis IX himself, the Sainte Chapelle in Paris and the Arsenal Bible in Acre. Two were apparently commissioned by Blanche of Castile, his mother, also in Paris, the two Moralized Bibles. The other, MS 638, was arguably a royal commission, possibly ordered by Louis IX in Paris, but the details are, however, still not known to us.[491] Now that the "artistic bridge" has metaphorically been constructed by Weiss – linking Acre and Paris, the Arsenal Bible, and Sainte Chapelle, in the person of Louis IX – we can begin to see more clearly how Arsenal MS 5211 is correctly related to the wider world of French royal monuments, in manuscripts and other media, as well as to other Crusader work.

Approached from this point of view, the question then arises: What is "Eastern" about this codex; what are its unique "Crusader" qualities? If this manuscript is conceived as a royal French commission, with a text written in Old French, how did its program of imagery come into being, and what can we see in this program that reflects the circumstances of King Louis IX in Acre between May 1250 and April 1251? For this we must examine the iconography and the style with fresh eyes. Starting with the iconography, there are surely some very striking features that set this manuscript apart from any others – Crusader, French, or Byzantine – in the mid-thirteenth century. There is, for example, the iconography of ornament, an unexpectedly major feature of this book. Of the twenty frontispieces, nine unequivocally reflect the bold design and novel configuration of stained-glass windows with the use of medallions, quatrefoils, or octagons in which the miniatures are placed, set against decorative fields with equally boldly conceived ornament drawn from similar sources.[492] Another five frontispieces utilize architectural motifs of round arches, pointed arches, or trilobed pointed arches, again reflecting designs drawn from monumental sources in settings of gothic architecture or from large-scale miniature painting.[493] The rest of the designs are conventional grid patterns creating rectangular frames for the miniatures that can also be seen as related to stained-glass or manuscript illumination, but not so explicitly and exclusively.[494] Nonetheless, all of the frontispieces are enlivened by dramatic color and ornamental richness that is imperfectly transmitted through black-and-white reproductions. The major coloristic program for each of these frontispieces is indeed wonderful. There is Gothic red and blue or pink and blue; red and blue combined with a rich purple-red; purple-red, blue, and lavender; or pink, red, and blue, all of which are enhanced by their strong hues and by contrasting gold grounds.

There can be no doubt that these designs are partly based on Gothic ideas drawn from the Moralized Bibles, the Morgan MS 638, and Sainte Chapelle, but the unique blend of ornamental diversity is a special feature of this manuscript that cannot be found in any of the aforementioned codices. Although we know of no project in the Holy Land or, more specifically, in Acre, that could explain this ornamental richness, the special combination of intense colorism and bold design seems to be one of the "Eastern" and "Crusader" characteristics of this manuscript. Just as each of the windows in Sainte Chapelle has its own decorative design feature, be it circular medallions, ovals, diamonds, quatrefoils, rectangular grids, and so on, the fact is that this program of ornament – distinctively different in Arsenal MS 5211 in its particulars – would no doubt remind the king of his magnificent reliquary chapel in Paris, while traveling with his *capella regis* in the East. The elegance of Gothic ornament and color combined with the richness of Eastern color and design is apparently part of what is intended in this distinctive ensemble of frontispieces.

When we turn to the iconographic program of the miniatures, the same combination of Western and Eastern sources is apparent. It is evident, however, from a careful inspection of this manuscript that the program of imagery is presented almost exclusively in a series of frontispiece miniatures, which as a type is essentially Western-based in its conception. Here we see the classic frontispiece format so celebrated in French manuscripts since the time of the Carolingian Empire. What messages do these frontispieces convey?

Taking as our starting point the two sections of the manuscript identified earlier, we can see that the frontispieces from Genesis to IV Kings deal with the historical narrative of the leaders of the chosen people in their quest for the promised land and their efforts to rule and defend it. The frontispieces in section two, from Judith to Ruth, portray the deeds, wisdom, and personalities of the heroines and heroes who ruled, defended, or served as God-fearing role models for the chosen people in the Holy Land. Briefly consider these frontispieces in each section as they pertain to Louis IX in Acre in the latter months of 1250.[495]

For the Pentateuch, we can see that the imagery of each frontispiece directs our attention to specific figures, but that following the Lord's appearance on the Genesis page (Fig. 146), the overall focus is unquestionably on Moses as the leader of the chosen people. On the Creation page, our eye is strongly drawn from the Lord Creator to Cain and Abel below, by their dress and the colors of their costumes. They are those who worship the Lord, and in this program they are to be followed by Moses, identifiable like them in his costume and the colors of his clothes. In Exodus (Fig. 147), the story of Moses is presented, with emphasis on his encounters with the Lord and his responsibility for bringing the law to the Israelites. In Leviticus, the leadership of Moses is presented in the context of worship and offerings, both good and bad, on the one hand, and manifestations of the power of God on the other. In Numbers, the leadership of Moses and the Lord's confidence in him is reiterated visually, and Moses is contrasted with Balak, a ruler not in God's favor. Finally, in Deuteronomy, Moses completes his responsibilities, receiving the commandments again, appointing his successor, Joshua, viewing the promised land he will never enter from Mount Nebo, and then dying and being buried by his people. Louis is the new Moses, leading his people in glorious success and bitter disappointment, like Moses, ever devout to his God.

Following the Pentateuch the story of the leaders of God's people continues. There is Joshua, Judges, and I–IV Kings. With the frontispiece to Joshua we see the God-fearing soldier, who leads his people to victory in the promised land with the help of God. He does this while bringing along the Ark, that is, the physical tablets of God's manifestation and message on earth, just as Louis had carried the holy relics of Christ with him on Crusade. For Judges we are shown the zeal of Gideon and the obedience of Jephthah in response to the words of the Lord, and the trials of Samson. As a hero of the Israelites, Samson must have been a particularly poignant reminder to Louis of his own capture by the enemy during his painful retreat from Mansurah. But Samson was also a stirring role model as shown here, with his great strength restored in the midst of adversity through his constant faith in the Lord, and his ability in the end to bring his adversary down. In I–III Kings, unsurprisingly, the emphasis is on David as the military hero, the anointed king, the devout leader who on the one hand leads his people and praises God in joy, and on the other repents and prays for God's forgiveness in his personal time of misery and need. How many times, while in prison and after his release, when sailing from Damietta to Acre, must Louis have thought about the rebuke of Nathan and his wonderful promise that the Lord can also take away his sin. How much he must have wondered if, like the child of Uriah's wife in II Kings 13, his own son, born in Damietta during his incarceration, might die because of the Lord's displeasure. It is in III Kings that Solomon, David's great successor, appears, riding on a mule and anointed as the new king of Israel. In this beautiful and striking miniature with bold and elegant cross-shaped designs, every scene contains royal iconography of crowned figures ranging from triumph and coronation to dying and death. In the context of David's demise as represented in this frontispiece, Louis must have meditated on how he would eventually be able to provide support for the leadership of the Latin Kingdom he would leave behind when he did in fact return to France. Finally, in IV Kings we find an affirmation of the continuity of the chosen people in the Holy Land after David and Solomon, even without a conventional king. The lesson here is that Ahaziah, a king who worshipped a false god, did not find favor with the Lord, and he died; Elijah, a true man of God, did find favor, and he lived. Elijah is a striking figure as presented here, a vigorous outdoors man in his unconventional clothing – a brown wool tunic and a furry green cloak – a man favored by God because of his faith. The Lord's power is manifested in support of his prophet Elijah. Louis could meditate on how the spiritual leadership of the chosen people was passed from Elijah to Elisha without death or burial, as Elijah was taken up bodily into heaven. A biblical role model like this could no doubt help enable Louis to sustain his ardent devotion to God, in his son Jesus Christ who was also taken up bodily into heaven.

All through the first part of this program, the leader or ruler has been visible in his distinctive costume, and it is David and Solomon who are particularly singled out in their red and blue robes as king. This same coloristic iconography links them with the three monumental author portraits of Solomon in the second part of the book, the frontispiece images for the three books of Proverbs. By contrast the other heroes and heroines have striking and different visual manifestations in these frontispieces. It is particularly notable that there are no fewer than three heroines in this section. One, Judith (Fig. 148), the savior of her people from the cruel Assyrian king, Holofernes, who invaded Judaea, wears a stunning silk garment of blue-green and gold threads as she demonstrates her sublime faith in God and her heroic love of her people. Esther, the queen, also saved her people, but in a foreign land, in Persia. Esther wears appropriate regalia, and in the climactic scene, she receives a sceptre topped with a fleur-de-lis. Finally, Ruth appears more modestly dressed, as a character role model. All three heroines exemplified virtues Louis wished to emulate, but they clearly pertained also to his faithful wife, Marguerite, as well. It was she who had stalwartly supported him and his Crusade as she lay exhausted in her bed after childbirth in Damietta. In that vulnerable situation, she had summoned her extraordinary courage and strength, organized the ransom of her husband, and galvanized the allegiance of the Italian merchants of the city to his cause. There is also Tobit, a man of unwavering faith, to whom the Lord restored his sight. Perhaps, on reflection, Louis understood through the example of Tobit that the Lord had restored his health after his terrible imprisonment, despite what Louis saw as his deplorable failure on the Crusade.

There can be no doubt, of course, that the three author portraits of Solomon form the focal point of this second section and in this series of images, Weiss has seen a remarkable subprogram, a representation reflecting Louis's microcosmic circumstances in the Holy Land.[496] In the first Proverbs image, titled "Wisdom," Solomon enthroned is dressed in Byzantine-style regalia,[497] and his *amanuensis* is seated before him with his book open, awaiting instructions. These two figures, accompanied by three other important figures – Holy Wisdom, Christ, and the Virgin – are seated in an elaborate architectural setting that seems to evoke the king's presence in a formal audience. It is clearly meant to symbolize Solomon's temple,[498] which Weiss argues convincingly is based on *Bible Moralisée* imagery, the Templum Domini, and Sainte Chapelle itself. Whether it could have also reflected the king's audience hall in Acre during his residence is unknown, but the symbolism is clear, as Weiss explains it. What is fascinating about this "portrait" and the two following, where Solomon is again accompanied by his *amanuensis* seated under a trefoil Gothic arch, is the variations given both king and attendant. In the second scene, titled "Parables," the king is now wearing more "Western" dress – a blue cloak over royal gray tunic decorated with gold – evoking the Old Testament leaders such as Moses or Gideon in earlier frontispieces. But here he wears again the Byzantine-style crown as in the "Wisdom" image, and the *amanuensis* is standing with his arms crossed on his chest. It is a gesture of submission and veneration known to be accorded the Byzantine emperor.[499] In the third scene, titled "Proverbs," the king's representation is again with the Byzantine-style crown and the more "Western" dress, but this time it is a red cloak over a blue royal tunic decorated with gold, like David and Solomon in the earlier frontispieces. Here the attendant is now seated on the ground, with his legs crossed instead of his arms, reflecting formal Near Eastern Arab practice between a teacher and his student.[500]

The intent of these three "portraits" seems clear. First, the artist wanted to link these images of Solomon directly to the imagery of the frontispieces in the first part of the manuscript, while also giving special emphasis to the royal figure by his unique presentation in the "Wisdom" image. What is significant about this representation is not, however, that the king looks Byzantine, but that this image evokes the image of a Crusader king, because the Crusader kings were, since the second half of the twelfth century, wearing regalia strongly modeled on Byzantine types. So for Louis, he was meant to understand that this is relevant to Louis himself as the new Solomon, a "Crusader" king in his Gothic-inspired "Templum Ludovicensis." Second, the topos of the royal figure with his attendant is meant to evoke for us the king in dialogue with the Frankish, Byzantine, and Arab[501] cultures of the Latin Kingdom. The biblical wisdom of these Books of Proverbs is directed to benefit Louis IX in dealing with this multicultural society that he was called to lead. It was a daunting challenge, and these images are both a subtle and sophisticated indication on the one hand, and a magnificent and forthright expression on the other, of what Louis had to deal with as the Crusader leader in residence.

This "Bible" program of frontispieces ends with the books of Maccabees and Ruth, represented with appropriate, if personal, imagery, to some extent. In a direct and positive representation, the Maccabees of course are shown as victorious soldiers overcoming the infidels, their oppressors. This is what Louis aspired to achieve, by military and diplomatic action. But Ruth is a remarkable choice to end the second section and the program overall.

Ruth exemplifies filial piety, self-sacrifice, and moral integrity. These are virtues by which Louis attempted to live his life. These are virtues his wife, Marguerite, also exemplified. The familiar scenes of Ruth and Boaz that conclude the imagery here definitely give a personal, meditative, somewhat introspective and reflective ending to a richly varied program in this manuscript.

Based on the visual content of these frontispieces as proposed, several conclusions can be drawn. First, the imagery of Arsenal MS 5211 provides an ensemble that, like its text, is meant to edify its owner, its reader. Whether the biblical book is long or short, there is a major frontispiece for every one. The frontispieces therefore, individually and collectively, provide a special index of the content of this "Bible," which direct the reader's attention to certain themes and lessons. In section one, we find a selective historical narrative dealing with the promise of the Holy Land from God, the idea of a people chosen for that land, and access to and leadership in the Holy Land. In section two one finds role models for a leader in the Holy Land in terms of worthy men and women of the Old Testament. It is nothing less than a very personal, biblically based early version of a *livre du roi*, the kind of a book for princes that Philippe III would commission later more explicitly from one of his Dominicans, frère Laurence, in the late thirteenth century.[502] Second, the nature of this program in Arsenal MS 5211 corresponds to the responsibilities that Louis stated in his letter of August 1250, where he explained his obligations to continue his efforts to reconquer and to defend the Crusader Kingdom, among others. Third, it seems that we may reasonably entertain the possibility that Louis IX in fact commissioned this book at the time he made his decision to stay in the Holy Land in August 1250. I propose that the specific program contained in this book, both in images and in text, pertains to the personal and royal agenda of Louis IX in Acre at this time. I suggest that it was produced for him in the succeeding months, between August 1250 and late March 1251, after which he went to Nazareth on pilgrimage and then moved to Caesarea to assist the reconstruction efforts there. Seen in terms of this scenario, we can bear in mind that the production of Arsenal MS 5211 would have an additional parallel to Sainte Chapelle, along with those already so persuasively argued by Weiss.[503] Recall that Sainte Chapelle was commissioned and carried out in the middle 1240s as a statement of Louis's Crusade ideology while his preparations for the expedition in 1248 were vigorously in progress. In a similar way, the Arsenal Bible may well have been commissioned and carried out during Louis's energetic activity in Acre during the nine-month period when he endeavored to significantly strengthen the fortifications of the city, while endeavoring to bring home the Crusader prisoners by diplomatic means. It provided him with a very personal book of Bible history and Bible heroes, which contained an Old Testament–based visual agenda for his leadership role in the Latin Kingdom on which to meditate and reflect.

The question remains, if he did commission this book in the late summer of 1250 in Acre, how did he manage to have it produced? There had been no significant luxury books made in Acre for many years. The only scriptoria that apparently existed were presumably those in the hands of the patriarch of Jerusalem attached to the Cathedral of the Holy Cross, and those belonging to the religious and military orders, about which we know virtually nothing specific at this time, *c.*1250. Furthermore, where could Louis have found a high-quality master painter to carry out this commission? Further examination of Arsenal MS 5211 will help us propose a framework in which the answers to these questions may be found.

As the analysis of Buchthal and Weiss have demonstrated, the specific iconography of MS 5211 is based on a series of major biblical cycles, known from important thirteenth-century French manuscripts from Paris, and mostly middle Byzantine manuscripts from Constantinople. These manuscripts include the Moralized Bible now in Oxford, Bodley MS 270b, produced in Paris by *c.*1240 and the Morgan Old Testament Picture Book, MS 638, made there in the mid-1240s, as well as the Byzantine books of the Octateuch, Books I–IV Kings, and imagery of an aristocratic psalter like the Paris Psalter, books originally in the imperial library in Constantinople. The fact that we can identify the sources so precisely enables us to know which rich resources were placed in the hands of the scriptorium manager and the artist of this project in Acre. The question of how this artist was able to access such resources in Acre, around September 1250, is a difficult issue to explain, but far from inconsequential to consider. Clearly the answer, however, must involve Louis IX, who apparently ordered this codex to be made and who alone possessed sufficient financial and political resources to make it possible to produce a work of this elegance and importance in the embattled city of Acre at this time.

There is no need to rehearse the full iconographical analysis carried out so ably by Buchthal and Weiss. We may, however, note some important pictorial features found in these miniatures that pertain to the program of the manuscript and the circumstances of its production. The fact is that each frontispiece has certain special iconographical characteristics that give it a distinctive character, identify or at least refer us to its source(s), and exemplify the fact that it was made in the Crusader Near East. Briefly, what are some of those special features that distinguish these images?

In the Creation frontispiece (Fig. 146), the representation of the Lord as Jesus with a crossed halo performing his creative acts in an orb of the world held before him is, as Buchthal and Weiss have shown, originally derived from Byzantine sources, but are immediately dependent on the Moralized Bibles.[504] Nonetheless, apparently one of those scenes is unique, possibly invented in Acre for this program, namely the imagery of the Creation of Eve in which she appears frontally and prominently from the groin of Adam who is, and this is the notable feature, represented lying with his back toward us. Obviously the choice of this scene and this design places the emphasis on Eve, and this is one of several examples in the illustrations of Arsenal MS 5211 where women are singled out for special attention, perhaps with Queen Marguerite in mind.[505]

The lower half of this frontispiece with five scenes of the Adam and Eve/Cain and Abel story, seems, however, to have been based on a different but no less impressive manuscript, the Morgan Old Testament Picturebook, MS 638, with certain variations. Not only do the iconographic elements mostly closely follow MS 638, but also the style of the nude figures is somewhat comparable. Several bits of iconography here are also unusual. Although the Admonishment of the Lord appears here as in MS 638, the Lord has reversed his hands and Adam and Eve, still innocent, do not cover their genitals. In the scene of Eve spinning and Adam delving after their expulsion, Cain and Abel appear as we see them in MS 638, but whereas they are both working as children in tunics in MS 638, in MS 5211 Cain is a young boy clothed in a tunic, whereas Abel is still an infant suckling at his mother's breast, a variation rarely seen.[506] In the last scene, with Cain and Abel presenting their offerings, the fact is that Abel is depicted looking back over his shoulder, away from the altar and the Lord above. It is as if he was turning to see the next episode, which in Arsenal MS 5211 does not exist, but does in MS 638.[507] Finally we also note an Eastern touch to this ensemble, namely, the camels added to the creation scene of the animals. Thus, we find the end result of this page to be a de novo creation of the artist; in fact this is what characterizes the set of frontispieces for the Pentateuch, indeed for the entire manuscript. What is impressive in nearly every case is the way Byzantine and French iconography – sometimes together, sometimes separately – have been combined with reference to Near Eastern visual aspects to create an original version of familiar narrative cycles, done by a major master with deep French Gothic and Byzantine stylistic sensibilities.

Consider the other examples in the first section of this Bible history. The frontispieces for Exodus, Leviticus, Numbers, and Deuteronomy are all based on the "standard middle Byzantine cycle of Old Testament illustration," derived from the Octateuchs or other manuscripts that reflect the same tradition.[508] The Arsenal Master, however, represents the central figure of these episodes, Moses, in the characteristic Western manner, that is, bearded, in contrast to the Byzantine mode of a youthful, beardless figure. In effect, Moses is shown to be a "Westerner" in the midst of his Eastern context, like Louis, the new Moses, who commissioned this book. It is also true that the narratives of two of these frontispieces – those of Leviticus and Numbers – are rearranged with certain scenes inserted from an earlier book, Exodus, to maintain the focus on the deeds of Moses.[509] And the dramatic scene of Moses loosening his sandals before the Burning Bush in which the head of the Lord appears in Exodus is another instance, one of several, in which the artist has drawn on the Moralized Bibles and Morgan MS 638 for his model.[510] Yet these illustrations also have scattered indications of the contemporary Eastern setting in terms of the costumes of certain figures, especially notable in the Leviticus images.

Compared with the Pentateuch illustrations, the frontispiece to Joshua is almost exclusively based on a Byzantine source. Joshua is seen as the agent of God conquering the Holy

Land, a triumphant general as Louis hoped to be as well. The question of which Byzantine source is reflected here, the Joshua Roll from the tenth century or the source of the Vatopedi Octateuch from the late thirteenth century, is a matter of debate. Weiss and Buchthal argue that source was ultimately the Joshua Roll, but that both the Arsenal Master (1250) and the Vatopedi 602 artist (*c.*1290)[511] reflect changes in that cycle, perhaps from an intermediate model. The most significant point here for our purposes is that most likely the Byzantine model used by the Arsenal Master was from Constantinople, quite possibly in the early thirteenth century. This means that the Arsenal painter apparently had recent and substantial access to Byzantine manuscripts during the Frankish presence in the Latin Empire before working in Acre. Even so, there is no slavish copying here. The order of the scenes has been changed to lend dramatic effect to the telling of Joshua's story, placing emphasis on the scenes of Joshua and the Angel, and Rahab's courageous assistance to Joshua's soldiers while reconnoitering inside the city before the attack. The depiction of Rahab is another example of special emphasis being given to biblical women who were instrumental in these stories. The city of Jericho is, however, transformed from its appearance in the early Octateuchs, so that here, with its yellow stone masonry and turreted towers, it evokes the fortified cities that Louis found in the Holy Land, at Acre and elsewhere. This depiction furthermore resembles closely the imagery found slightly later in the illustrated *Histoire Universelle* and *History of Outremer* manuscripts done in Acre.[512] Here it seems we can see the Arsenal Master initiating a contemporary mode of painting the image of the "fortified city" in Acre, which is then carried on in secular painting here long after his departure.

Judges is one of the important books of the Byzantine Octateuch, so it is no surprise to find the imagery of this frontispiece heavily reliant on Byzantine iconography from this source. The episodes of Gideon, Jephthah, and Samson are all recognizeably based on the Byzantine tradition with certain modifications, but with the exception of the destruction of the Midianites. Buchthal and Weiss see this incident as deriving specifically from the Oxford Moralized Bibles,[513] yet nonetheless the soldiers are clearly wearing Byzantine armor.

When we reach the frontispieces the Books of Kings, the strength of the Byzantine sources is less strong compared with the books of the Octateuch, both in number of extant manuscripts and in number of illustrations. In fact there is only one fully illustrated Byzantine codex of Kings,[514] in contrast to the six extant Octateuch manuscripts. The result is that despite the fact that much of the Kings imagery may derive ultimately from Byzantine sources, it is harder to identify exactly what that source may have been, and the strength of Western manuscripts as the immediate model regularly seems stronger, along with occasional details drawn from the artist's Near Eastern context.[515] In I Kings the anointing of Saul and David and Goliath have certain Byzantine details. But the seated King Saul with his crown, his costume, and his throne – the *sella curulis* – is explicitly Western, based on the French coronation ritual, as also seen in MS 638.[516] The depiction of Goliath falling with the stone from David's sling stuck to his forehead is also a Western idea, seen in both the Moralized Bibles (e.g., Vienna MS 2554) and in MS 638, although the poses are closer to those in the former.[517]

For II Kings the anointing of David is handled in a manner similar to that of Saul, but with a labarum and a golden orb, without the faldstool and with a Byzantine bench throne. These details indicate that, as Weiss perceptively argues, the artist is actually basing his images of anointing on the Ordo of 1250, a work which Louis IX had produced shortly before he left France on Crusade.[518] Truly Louis is the new David, the Lord's anointed, as seen here crowned in his red and blue garments, in fact in all three scenes.

Near Eastern details are also evident here in the scene where the house of Israel led by David plays musical instruments before the Lord. Not only is one of the four musicians playing with David wearing a turban, but all of the instruments these five figures play are also given an Eastern form. David plays an early Arab precursor of the lute. There are also cymbals, a tambourine, a psaltery, and a slightly curved shawm, all instruments derived from Arab sources.[519]

The strength of the Byzantine tradition is also forcefully indicated in the rebuke of Nathan in the lower register, where the artist has shown David kneeling before Nathan with an angel *and* a personification of *metanoia* (repentence). In Byzantine works only one of the accompanying figures is usually found, but here greater emphasis is being placed on the repentance by having both with David in front of Nathan. The Arsenal painter has transformed the angel behind David in the Byzantine source into *metanoia*, and the angel has somewhat awkwardly been painted full length at the left, for which the model was only half length. It is a rare lapse in the high quality of these figures, as Buchthal points out.[520] Nonetheless, it shows the interest the patron had in the theme of repentence, a theme with which Louis IX was indeed obsessed following his release from prison in Egypt, as reported by Joinville. It also shows the wealth of sources – a Byzantine MS of the Homilies of Gregory of Nazianzus and a Byzantine aristocratic Psalter – which the artist of the Arsenal MS 5211 could draw on.

In III Kings, the combination of Byzantine imperial regalia and French coronation ritual is continued in the depiction of the transfer of rule from David to his son, Solomon. Again, the seated king, Solomon, is anointed as before and this time he himself holds the labarum and the orb. But here the priestly king, David, is mourned by Solomon and Bathsheba at his burial, wearing Byzantine clerical robes and honored with a halo, which even Moses was not accorded in his burial scene for Deuteronomy.[521] Considerable emphasis is placed on this frontispiece overall, not only by the royal iconography in each scene, but also by the bold designs of the quatrefoils and the elegant equal-armed crosses. In some sense this is a climactic image for section one, which is to be linked with the three portrait images of Solomon in section two. By contrast, the IV Kings frontispiece brings the first section of this manuscript program to a close. It features the story of Elijah, a true man of God, and the power of faith. It illustrates how even kingship is limited by the faith of the leader.

By contrast to the books of the Old Testament found in the first section of this Bible, all of which show the significant impact of Byzantine models, six of the nine frontispieces in the second section – those for Judith, Esther, Job, Tobit, Maccabees, and Ruth – have little or virtually no Byzantine iconography. In some cases, for example, with the books of Ruth and Job, Byzantine models certainly existed that were simply not used, in favor of Western ones. In other cases, for example, with Esther and Tobit, there simply are no Byzantine models. In the cases of these six narrative frontispieces, their sources are therefore Western, mostly French, and mostly from the Moralized Bibles. But some also show the most interesting array of Near Eastern visual vocabulary in terms of costume – robes, headdresses, and accessories – and animals. In the Judith frontispiece we find her in an elegant and somewhat exotic silk costume in addition to the oriental headdresses worn by numerous Israelites in her company. The frontispiece to Esther returns to the royal iconography seen in I–III Kings, combining French and Byzantine aspects.

It is perhaps in the scenes for the Book of Job where we see the richest combination of an observed Near Eastern visual repertory – the Crusader version of "Gothic Naturalism" – combined with a Western cycle. Buchthal has pointed out how "the arrangement of this page was undoubtedly suggested to the Arsenal master by a Western model in which the grouping of the episodes from the story of Job was similar to that in the Erlangen Bible."[522] This south German Bible, the Gumpert Bible now in Erlangen of *c.*1200,[523] with certain indications of French influence, is an example of the giant Bibles that were so popular in Europe, especially in Germany and Italy, and elsewhere to a lesser extent. Weiss has scrutinized this page in Arsenal MS 5211 in great detail, drawing our attention to the Near Eastern subtleties that might otherwise be missed. Everyone can recognize the camels and the exotic hats worn by the Chaldeans in the central-right half medallion. But in the scene of Job and three friends, the scene at the lower right, the iconography reveals some unusual details as analyzed by Weiss. Eliphaz the Temanite, Bildad the Shuhite, and Zophar the Naamathite are wearing Eastern dress, unlike what is found in the Erlangen Bible or Oxford Bodley MS 270b. In addition to their handsome turbans with trailing endpieces, we can also see that the figure in the foreground has the ornamental embroidered silk *tiraz* on his robe. Weiss also notes that this foreground figure "holds in his left hand the *zizith*, fringes made of knotted threads usually attached to a man's *tallit* as a sign of religious devotion and a means of distinguishing Jew from Gentile. Even the color scheme of white threads with an entwined cord "blue as the sky" was prescribed in the Bible and Talmudic law. In this image, the *zizith* are not worn properly affixed to the corners of a garment, but are present to signify that these figures are indeed Jews."[524] The ability of this painter to show Job's friends as Eastern Jews and to render such distinctions among the multicultural population he must have seen in Acre is a tribute both to his ability as a painter and his powers of observing and understanding the varieties of dress among the diverse peoples around him.

We have already discussed certain aspects of the three author portraits of Solomon and their internal program, which form the climax of these frontispieces in the second section. What is significant, however about these monumental images, images that interrupt the narrative flow of these frontispieces and thus draw attention to their importance, is the richness of the iconographic repertory for the first effigy, Solomon, who appears at the beginning of his book of proverbs, titled "Wisdom," and provides the grand introduction to the other two portraits. In the first instance it is clear that the iconography of the Moralized Bibles provides a basic source for the imagery of the king enthroned with his *amanuensis* in an architectural setting.[525] Secondly, not only does this impressive composition draw on the Byzantine aristocratic Psalter tradition of the imagery of David and the personification of "melodia" as is familiar from the Paris Psalter,[526] for example, but also the Arsenal Master is acquainted with icon painting and Byzantine Bible frontispieces as well. In the imagery of icons of St. Nicholas in particular,[527] we find similar depictions of half-length figures of Christ and the Virgin, albeit carrying different objects, that together with certain manuscript examples, such as the Virgin behind an architectural element in frontispiece to the Niketas Bible,[528] provides clear evidence for the Byzantine traditions that lay behind the conception of this portrait. It is notable, however, that the portrait frontispiece in question departs from its antecedents in various important ways to articulate visually a new and different message. In the portrait, the figure of "melodia" has now been given wings, transforming her into an image of "Holy Wisdom," who is inspiring the king enthroned in his architectural setting. Above, Christ and the Virgin appear half length above the arched balustrade holding scrolls. They are clearly proffering the gift of Holy Wisdom contained on their scrolls – the Virgin's open, that of Christ closed – to the king below who is looking up toward Christ, holding an open book and perhaps listening meditatively to the guidance of Holy Wisdom who is seated closely behind him to the left.

It is these three author portraits that provide a "portrait" of Solomon, but also, in effect, provide effigies of Louis as the new Solomon, both as a Crusader king ("Wisdom") and as a French king in Eastern circumstances ("Parables" and "Proverbs"). These images of Solomon are the climax of the second section, which is actually completed, as we have already seen, with the frontispieces of Maccabees and Ruth.

These frontispieces are clearly the main focus of the decorative program of this manuscript, but they are not the sole elements. An additional important aspect is found in the large decorated initials that begin the text of each biblical book in this codex. All of the initials are done in Gothic style and color, with the painted and ornamented initial set on a gold ground. Besides the repertory of floral and abstract geometric gothic design, six of these initials are also historiated, containing figures that complement the book which they introduce. What can we learn from these six examples?

First, it is interesting to see which books have the historiated initials, and what is depicted in each case.

On folio 2r, at the start of Genesis, the initial "D" contains a Dominican friar seated and writing in a book.

On folio 53v, at the start of Leviticus, the initial "N" contains an image of Moses standing, holding the tablets of the law and gesturing toward the Lord with his right hand, who appears gesturing to him in the sky at the upper left.

On folio 120v, at the start of II Kings, the initial "U" contains a standing, frontal image of king David, crowned and holding an orb surmounted by a cross, and a scepter topped by a fleur-de-lis.

On folio 155r, at the start of III Kings, the initial "A" contains a messenger kneeling before King David to tell him of Saul's death. The distraught king seated, tears his garments in grief.

On folio 221r, at the start of IV Kings, the initial "C" contains an image of King Ahaziah falling headfirst from a window in his palace to his death.

Finally, on folio 297r, at the start of Tobit, we see in the initial, "T," Tobit tenderly burying a Jewish kinsman killed by the Assyrians.

Working our way backward through this series, we see first of all that the choice of books to receive historiated as opposed to mere decorated initials is somewhat random, and there is no particular explanation for why there are six or why these particular books have been chosen to receive the historiated initials. Nonetheless, the themes chosen for the historiated initials are clearly purposeful. The Tobit initial focuses on the piety of this holy man and reminds us of Louis joining in the burial of his fallen soldiers in Egypt. The fact that three initials for Books II–IV Kings are chosen is no surprise, given the importance of these books in the first section of the Bible. Some of the main themes recognized in the frontispieces are also alluded to here. First there is the effigy of the king in full regalia, a parallel to Louis, in effect, as a new Crusader king. Then there is the news of the death of a royal figure brought to the king. For Louis this imagery would carry a poignant reference to the news of the death of his brother, Robert of Artois in February 1250, following the Crusader attack on the Muslim army at Mansourah.[529] The death of Ahaziah is also shown as the fulfillment of Elijah's prophecy in IV Kings 1. Even though the text does not specify exactly how Ahaziah died, he is shown falling literally and symbolically from power, the victim of his lack of faith in the true God. In the initial for Leviticus, which shows Moses holding the law of God, we can see the representation as a sign for Louis, the new Moses, to uphold God's law as well. Finally, the Dominican scribe on folio 2r seems to indicate something important about how this manuscript was done, which I address later in the chapter.

Before looking into the circumstances in which this book may have been produced, we can conclude our discussion of the book itself with a consideration of the style of the artist. As noted earlier he is a painter of great accomplishment who is able to combine both French Gothic and Byzantine imagery with impressive skill. The frontispieces demonstrate both the sophistication and the high level of quality that this artist could achieve in his biblical imagery. The iconography and, to some extent, the figure style of these frontispieces is clearly drawn from the French and Byzantine sources available to him. The most striking and novel aspect of these frontispieces is, however, the ornamental designs that appear, mostly taken from the repertory of stained-glass windows. These designs and the essentially French Gothic character of the painted initials clearly indicate the French background of this artist.[530] What is impressive, however, is the way he has been able to combine elegant French Royal models with equally impressive Byzantine imperial models in producing his end result, in terms of not only the ornament, but also the figure style, iconography, and *mise en page*. Examination of the iconography has enabled us understand the varied sources on which this master's work is based. Analysis of his style can also tell us something about his training and other contemporary work that he may have participated in. Given the fact that only one figure painter seems to have been employed in Arsenal MS 5211, we may understand that he was an artist with an established reputation, to be called on for an exclusive commission from the king.

What are the characteristics of his style, and what other works are most closely related to his miniatures in the Arsenal Bible in stylistic terms? Just as we have seen in earlier major manuscripts from Jerusalem and Acre, codices such as the Melisende Psalter or the Riccardiana Psalter, the style of the miniatures in the Arsenal Bible features a blend of East and West that gives it its distinctive character as a Crusader work. In this case, however, the formal handling, its distinctive "look," is based primarily on a marriage of Gothic naturalism with Byzantine figure design. Indeed it is this union of Gothic and Byzantine together with the individual style of this master that is notably original with him, and unprecedented at Acre.[531]

The figures in these frontispieces, be they standing, seated, kneeling, walking, or reclining, shown frontally, in three-quarter view, or in profile, demonstrate a command of design and an ease of representation that is immediately convincing and impressive. These figures are organically conceived and have naturalistic proportions but tend to be somewhat stocky, often with large heads, hands, and feet. The few nude figures demonstrate a careful observation of the human body and a fluid manner of joining the limbs to the torso. The clothed figures feature draperies that are substantial, but clearly articulate the parts of the body with emphasis on the arms and shoulders, the torso, and the lower legs, depending on the pose.

The manner in which these figures are painted give them a certain monumentality and a volumetric quality that enables them to hold their own even set against the standard gold grounds in these frontispieces. The faces and exposed parts of the body are finely modeled in light and shade. The method of painting the faces, for example, seems to be based on a Byzantine technique combined with Gothic line. We see modeling in terms of sometimes dark, sometimes light greenish-grey or greyish-brown shading. Overall, there is a smooth integrated slightly three-dimensional effect of the skin defined by line, outlining one side of the nose and brow, as well as the eyes, sometimes with a linear extension from the eye back toward the ear, which often gives these figures what Buchthal referred to as a spectacled effect. Line is also important in the definition of the figure, outlining the body and the draperies, giving rhythmical shape to the folds: black outlines and white edge lines. The linearism is part of the Gothic quality of this artist, but it is distinct from the long straight extensions or the rather more flat decorative patterns of, for example, the masters of Morgan MS 638. In the Arsenal painter we see lines that define bulging forms and three-dimensional drapery patterns, some quite complex.

Finally we can notice that these figures are painted virtually without any emphasis on highlights. The color palette is regular, based on soft hues, mainly reds, roses and pinks, blues, grays, with occasional greens, and tans. The grays and blues of the figures tend to be dark and strong, forming a consistent appearance through these frontispieces against which the other colors can be seen. The system of modeling is based on modulated variations of lighter and darker shades of these colors and does not rely on Byzantine chrysography or the yellow or white highlights often found in earlier Crusader painting. The smooth finish of the skin and colored garments is also notable in that on close observation it appears quite painterly.

Not only can one sometimes see aspects of brushstrokes, but also it is possible to note subtle linear highlights blended into the coloration of the face, for example. Viewed in the normal way, the artist achieves a representation that suggests an integrated, even lighting over the figure, resulting in an effect of convincing three-dimensional volume. Furthermore, the figures move, gesture, and pose in a natural way that dramatizes their presence.

By contrast with the figure style, the handling of the settings is simplified. Apart from the ever-present ground line, indications of setting are usually minimal with certain exceptions. Where there are important landscapes, as with the scenes of Moses and the Israelites, or Elisha and Elijah, or significant architecture as seen in the Joshua and Judith, or the three Proverbs frontispieces, these too are also handled in terms of distinctive design. The mountains are plainly based on Byzantine types, and they are one of the few elements in these paintings that regularly utilize white highlights.[532] The architecture is variable according to the needs of the story. In the case of Joshua, the crumbling walls of the city of Jericho show strongly defined masonry and walls and towers topped by crenellations that reflect Crusader fortifications. The walled city in the Judith frontispiece shows a typical Gothic walled-city convention in terms of three-dimensional forms and red and blue color, without the explicit indication of masonry. The three Proverbs pages, however, are striking in contrast to the other frontispieces by virtue of their dramatic use of the Gothic pointed arches as an indication of location.

In sum, with few exceptions, the artist shows impressive control in the design and painting of these figures, a repertory of figures whether large or small, that seem so homogeneous in all aspects as to be the product of one hand.[533] The artist is obviously using traditional conventions of design here, drawn from both Gothic and Byzantine sources, but he blends them so skillfully that he brings his figures to life by infusing these conventions with his own acute observation of the visible world, his own command of Gothic naturalism. He appears clearly to be a French-trained painter who has had the opportunity to study important, high-quality Byzantine miniature painting during his formative period. The result in the Arsenal Bible is an ensemble of figural decoration that is rooted in strong French Gothic and Byzantine traditions, yet is also creative and distinctive. The sophistication and finish of the painting in the Arsenal Bible define its individual style. As an ensemble of outstanding quality and as a program of painting in a personal book for King Louis IX, this achievement "takes its place among the great Bible illustrations of the thirteenth century."[534] It is also original. We have not seen a program of this size and complexity, nor have we seen this style in Acre before 1250.

To the extent that this style is something new, not seen in Crusader, Byzantine or western European painting to this time, the question arises whether it has any close parallels. Buchthal proposes that "the nearest stylistic relatives to the Arsenal Bible are... the manuscripts in Perugia and Padua; the figures and scenes in the initials of the Perugia Missal, especially, are so similar that they might almost be the work of the same master."[535] Let us consider these manuscripts and other relevant *comparanda* to assess their relationship to the Arsenal Bible and their importance for understanding the production of manuscript painting in Acre.
